Everybody Can Play the "Autopiano"

In most families the ability to even "pick a tune" on a piano is limited to one or two persons, at best. If it is an "Autopiano," *everyone* can play it. The musician can sit down and play according to his tastes and training, while the inexpert music lover can rely upon the piano-player that is cunningly concealed within the case to interpret any selection he may fancy.

AS PLAYED BY HAND

The "Autopiano," in short, is an excellent piano and an artistic piano-player in one, with the marked advantage of economizing the space otherwise required by the detachable piano-player, and doing away with the labor of pushing the piano-player up to or away from the piano whenever a change from one kind of playing to the other is desired. With the "Autopiano" the change is made instantly—merely pulling out the pedals, which slide into the case when not in use, and inserting a perforated music-roll into the holder, which is disclosed by pushing back a panel over the keyboard.

AS PLAYED WITH MUSIC-ROLL

The "Autopiano" is a cabinet grand upright piano, full 7⅓ octaves, excellent in tone-quality, and with a responsive action that is in no wise interfered with by the mechanism. The case, in mahogany, burled walnut, or quartered oak, is of handsome design and finish.

The player is as absolutely satisfactory as the piano. Its mechanism, delicate but strong, makes possible a thoroughly artistic rendering of any class of music.

The low cost of the "Autopiano"—$485—constitutes another very strong point in its favor. Purchase is made very easy by our club system of small monthly payments, on approved credit, and our generous allowance on your present piano, if offered as part payment.

Let us write you fuller particulars.

VOL. LVII NEW YORK, THURSDAY, JULY 7, 1904 NO. 2901

Survey of the World

The Democrats at St. Louis

After the arrival of the Democratic delegates at St. Louis, the nomination of Judge Parker on the first or second ballot was predicted with much confidence by his friends. One newspaper supporting his candidacy counted 669 votes for him on the second ballot. It was reported that the large delegation from Pennsylvania would support him, and that its influential chairman had come to an understanding with the Judge concerning Federal patronage in that State. All attempts to unite in support of some other candidate those who were not willing to accept Judge Parker appeared to have come to nothing. Senator Gorman remained at home, and one of his nearest friends sent word that he did not desire a presentation of his name. Judge Gray, in a brief interview, expressed a hope that Mr. Cleveland would be nominated, but said that Judge Parker was his second choice. "I am not," he added, "and will not be, a candidate." Mr. Murphy, Tammany's leader, was still arguing for the nomination of Mr. Cleveland, but ex-Senator Towne (now also of Tammany) asserted that such a nomination would be suicidal, owing to the hostile attitude of the South and West. Nor would it be wise, he continued, to "nominate a lawsuit." Thus he referred to the question of Mayor McClellan's eligibility. John R. McLean, of Ohio, remarked that Mr. Cleveland was "an old rhinoceros, who would sit up all night for a month" to appoint to office his (McLean's) enemies and those of Gorman and Guffey; still, he thought the ex-President ought to be nominated, because he was "the best vote-getter in the Democratic party, the most popular Democrat in the United States, and the only man" who had "a ghost of a show to beat Roosevelt." One newspaper that had favored the nomination of Cleveland made a canvass of the delegates and then announced that it could find only 324 whose second choice he was, while 576 were positively against him. Mr. Bryan arrived on Sunday and at once resumed, in a public statement, his attack upon Judge Parker, whose nomination he regarded as "highly improbable," because "the influences back of him were so intimately associated with Trusts and great corporations that the party," if he should be its nominee, could not successfully "appeal to the masses;" and also because he could not be elected. "With such a candidate the battle would begin with a footrace and end with a rout." He asserted that more than one-third of the delegates would stand with him in demanding a candidate and a platform "truly Democratic." Considerable space was given in the newspapers to a report that Mr. Bryan was intending to nominate Prosecutor Folk, of St. Louis, in a speech designed to stampede the convention. It was decided that Congressman John Sharp Williams should be temporary chairman. Some expected that he would also be chairman of the platform committee, and that the platform would be substantially in accord with the one written by him for the State convention in Mississippi, a notable feature of which was an attempt to dispose of the currency question by expressing gratitude for the recent increase of the

world's stock of gold, " by no action of Government, but by the act of God."

Other Political Topics

At their national convention, in Indianapolis, last week, the Prohibitionists were quite willing to nominate General Miles, but he said in a letter: " The nomination would not afford that opportunity for efficient and important public service which would be the chief motive for my resuming public life." The nominees are Silas C. Swallow, of Harrisburg, Pa., for President, and George W. Carroll, of Beaumont, Tex., for Vice-President. In his address the temporary chairman, Homer L. Castle, denounced both the great parties, calling the Democratic delegates at St. Louis " a crowd of uncaged hyenas." The platform suggests that tariff revision be intrusted to a commission, calls for the election of Senators by direct vote, and says that suffrage should depend upon mental and moral qualifications.—Ex-Senator Butler, chairman of the Populist Executive Committee, has gone over to the Republicans, and is advising his former associates to vote for Mr. Roosevelt.—The Southern press sharply attacks that part of the Republican platform which relates to restrictions of suffrage and a possible reduction of representation. Thomas F. Ryan, a New York capitalist who is a delegate to the St. Louis convention from Virginia, has published a statement in which he urges the South to work for party harmony and the selection of a candidate who will arouse the enthusiasm of all Democrats, because " the bloody shirt, burned since 1885, is resurrected as a party banner." The spirit of this platform declaration, he says, " foreshadows a new Force bill and makes inevitable a concerted movement to revive all the evil passions to which such an appeal is made."—Mr. Daniel Davenport, counsel for the Anti-Boycott Association, who led the opposition at Washington to the Eight-Hour and Anti-Injunction bills, says that the labor plank in the Republican platform is highly satisfactory to the manufacturers who have opposed these measures. Because the bills are not approved in the platform, he predicts that the committee reports upon them will be adverse, and that there will be no labor legislation at the next session of Congress.

Confessions of St. Louis " Boodlers "

Prosecutor Folk, of St. Louis, has not permitted his personal interest in the State campaign to prevent him from attending strictly to business; and the fruit of his efforts is seen in two or three confessions that will assist him in bringing the " boodlers " of that city to justice. On the 27th ult., Edmund Bersch, one of the indicted members of the " combine " in the House of Delegates, entered a plea of guilty. Col. Edward Butler, a local political boss, had been on his bond for $45,000. On the following day Charles A. Gutke, another member of the " combine," who was soon to be tried, made a full and voluntary confession to Mr. Folk and the public. He had yielded to the urgent pleadings of his wife, he said, and would do what he could to atone for his sins. The details of all the corrupt sales of municipal legislation during the last few years, he continued, would fill volumes. The members of the " combine " (which he joined in 1897) were paid as follows: Suburban Loop Railway bill, $30,000; Belt Line bill, $18,000; Union Avenue bill, $18,000; Central Traction bill, $75,000; Third Street, $15,000; Lighting bill, $47,500. For the main Suburban bill they were to get $75,000, which is still locked up in a Trust Company's safe deposit box. There were " innumerable " smaller bribes, ranging from $10,000 down to $400, which was paid for the privilege of building an addition to the poorhouse:

" The bribe prices were fixed in meetings of the 'combine,' when some member would move that a certain price be asked for a certain bill. Other members would give their opinions, and a vote would be taken. Then we would select by ballot an agent to negotiate for and receive the money. This agent would distribute the money among us. I acted as agent in a number of these deals. From my intimate knowledge of dealings with this 'combine' and from information secured as to what has been going on here for the last quarter of a century, I make the positive statement that there is hardly a corporation in St. Louis of $250,000 capital or over that has not either been held up for bribe money or that has not bought official

action from the 'combine' in the House of Delegates. When these prosecutions commenced we were astounded, but still confident of our ability to escape. Ed. Butler assured us there was no danger and gave us authority to employ all the attorneys we wanted, and he would pay the bills, which he did. The 'boodle gang' in St. Louis is more powerful than the people dream of. It has millions behind it, and the chances are that unless the people rise up, the gang will succeed in getting control of the city again."

Butler claims, he says, that the jury which is to try Kratz in August is "all right." This man Butler, he asserts, has been the head of nearly all the "combines" for the last 25 years. Charles F. Kelly, also a member of the "combine," who was soon to be tried, has confessed to the grand jury that he received $50,000 from Butler to induce him to go to Canada, and then to Europe, in order that he might thus be silenced until certain persons should be protected by the statute of limitations. Because of this confession Butler was indicted on the 30th ult. It appears that the thieves raised $3,000 for John K. Murrell, who was in Mexico, a fugitive from justice. This money was to be carried to Murrell by Julius Lehmann, whom Mr. Folk recently sent to the penitentiary, but Lehmann kept it for his own use. The Missouri Supreme Court has at last affirmed the sentences of two rascals whom Folk convicted.

The Murders in Colorado

If the sworn confession of Frank Cochran, secretary of the local miners' union at Victor, Col., is to be trusted, the history of the dynamite explosion at the Independence railway station (which killed 15 non-union miners on the morning of June 6th) has at last been laid bare. This confession is made public by District Attorney Crump, and it involves the secretary of the Western Federation of Miners, W. D. Haywood, as well as other members of the union. Cochran says Haywood secretly visited Victor four days before the explosion, bearing a false name, and plotted the crime in conferences with two union men, Parker and Easterly, and with Cochran himself. Haywood complained, he says, that they had been too quiet and had let the mine owners have their own way. "We've got to put the fear of God into these fellows," he continued, and he told Cochran to see Parker and Easterly, who had "a mighty good plan." Cochran then met these two men in another part of the same building. They told him they had procured 500 pounds of dynamite and an electrical machine to explode it. Cochran says he thought the dynamite should be used at Goldfield station, because in that place "there were a lot of scabs we wanted to get rid of;" but his two associates preferred Independence. Parker was to "do the trick" on the night of the 4th, but he found that the electrical machine wouldn't work. "Then we planned to do it with a pistol, like it was done in the Vindicator mine." About 11 o'clock Sunday night the three went to Parker's house, where they got the steel wire and a pistol:

"We walked over to Independence and sat on the platform. Parker drove a spike into the ground and put the gun on it, pointing right at the dynamite. The agent was inside and couldn't see us. Then we ran the wire along the platform and out at the end. Parker said the man who fired it could run it out behind the dump. I asked him who was going to do it, and he said Victor Poole; that he had given him $200 to do the job. Poole was to cut over the mountains to Cheyenne Cañon and there he would meet a man in a wagon who would take him to the railroad at Colorado Springs. Parker said he was going to Mexico. He told me to stay here; no one would suspect me. Everything worked just as we planned it. They exploded the dynamite, and Parker and Poole got away, and I was caught. I don't know where they are."

Following the verdict of the coroner's jury concerning two men killed in the street riot at Victor on June 6th, warrants were issued for President Moyer, Secretary Haywood and thirty other members of the Western Federation, who were charged with murder and with inciting riot.—Justice Steele, of the Colorado Supreme Court, has filed a long minority opinion dissenting from the recent decision by which the majority supported the action of the Governor, asserting that the court has ignored the Constitution, and that the

Governor has exercised power in violation of it.—An inquiry concerning the labor situation in Colorado has been begun by Col. Carroll D. Wright, Commissioner of the Bureau of Labor in the Department of Commerce. Ample authority for such an investigation is found in the statute by which the Bureau was established.—A strike of large proportions is now in progress in New York, where 50,000 garment workers have quit work, protesting against "the open shop." The origin of this controversy is found in the action taken last spring by the National Clothing Trade Association at its meeting in Philadelphia. Following that meeting, the clothing manufacturers in New York posted, in their factories and other places of business, notices that they would maintain "open shops." A strike was expected at that time, but it was deferred until two weeks ago, when the cutters went out and were soon followed by a majority of those who make up the garments. Neither wages nor hours are involved; the question is whether the manufacturers shall employ non-union men. It became known last week that Henry White, secretary of the United Garment Workers, and a well-known labor leader, had resigned, owing, it is said, to his disapproval of the strike.—A lack of orders has caused the discharge of nearly 10,000 men from the Baldwin Locomotive Works. About 6,000 are retained.

School-teachers from Porto Rico

Two hundred school-teachers from Porto Rico arrived at New York last Friday evening on board the Government transport "Sumner," to remain in the States for nearly two months. About 125 of these visitors are young women, natives of the island; with them are 50 young men, and 20 young women from the States who have been teaching in Porto Rico for some years. At the same time, the transport "Kilpatrick" was carrying 400 more teachers from the island to Boston. These will study for six weeks at the Harvard summer school; those who came on the "Sumner" went at once to Ithaca, to study for as many weeks at Cornell. Before they sail for home they will visit Boston, Philadelphia and Washington. For expenses each visiting teacher contributes one month's salary, the Government supplies transportation, and a considerable sum has been obtained by popular subscription in this country. It has not been an easy matter for these young men and women either to fit themselves for teaching or to take advantage of this opportunity to get additional instruction. Very few of them can afford to give up a month's pay, and some of the young women whose schools are in the rural districts sold the horses which they have been accustomed to use in going to and from their school houses.—Dr. Samuel McCune Lindsay, Commissioner of Education on the island for some years past, has resigned, and the President has appointed in his place Dr. Roland P. Falkner, a graduate (1885) of the University of Pennsylvania, and at present Chief of the Division of Documents in the Library of Congress.

The Filipino Visitors

At a dinner given in Boston to the Filipino visitors by Governor Bates the speech making had the character of anti-imperialist pleading, owing to the remarks of Mayor Collins and Henry M. Whitney. The Mayor quoted passages from the Declaration of Independence and asserted that the Filipinos had a right to govern themselves; if they should not be oversuccessful in doing it this would be none of our business. He advised the Commissioners to take home with them the lessons of liberty made effective at Bunker Hill, and to say to their fellow-countrymen that a great part of the American people were still true to the teachings of the Declaration of Independence and the Sermon on the Mount. Mr. Whitney spoke in the same vein. He believed, he said, that a majority of our people were true to the early principles of liberty and justice, and would never be satisfied until the Philippines were independent. He should always cling fast to the hope that the old American spirit of justice and fair dealing would "prevail over any temporary feeling of pride we may have in extending our authority

over conquered and subject races." Following him several Filipino speakers, one after another, argued for the independence of the islands and for the same right to self-government for which, they said, the Americans had fought the English in the Revolution. An exception in the list of these Filipino speakers was Dr. Pardo de Tavera, the head of the delegation and a member of the Philippine Government Commission, who said the islanders would be satisfied with Statehood in the American Union and would not insist upon absolute independence. An unpleasant impression was caused by the souvenir satin-covered boxes in which ices were served, each one bearing an effigy apparently designed to represent a Filipino savage from the jungles, of chocolate color and devoid of all clothing except a girdle of feathers. Some of the visitors explained that the caterer must have been misled by stories about the followers of the Sultan of Sulu. From Boston the visitors journeyed Westward. At Canton a committee placed a wreath on McKinley's grave. Don Cayetano Arellano, Chief Justice of the islands, received the honorary degree of LL.D. at the Yale commencement, and at the same time the degree of M. A. was conferred upon Dr. Pardo de Tavera, a member of the Philippine Government Commission. —Archbishop Guidi, Apostolic Delegate, to whom was intrusted the task of adjusting with Governor Taft the sale of the friars' lands, died at Manila on the 26th ult. of heart disease.

French Politics

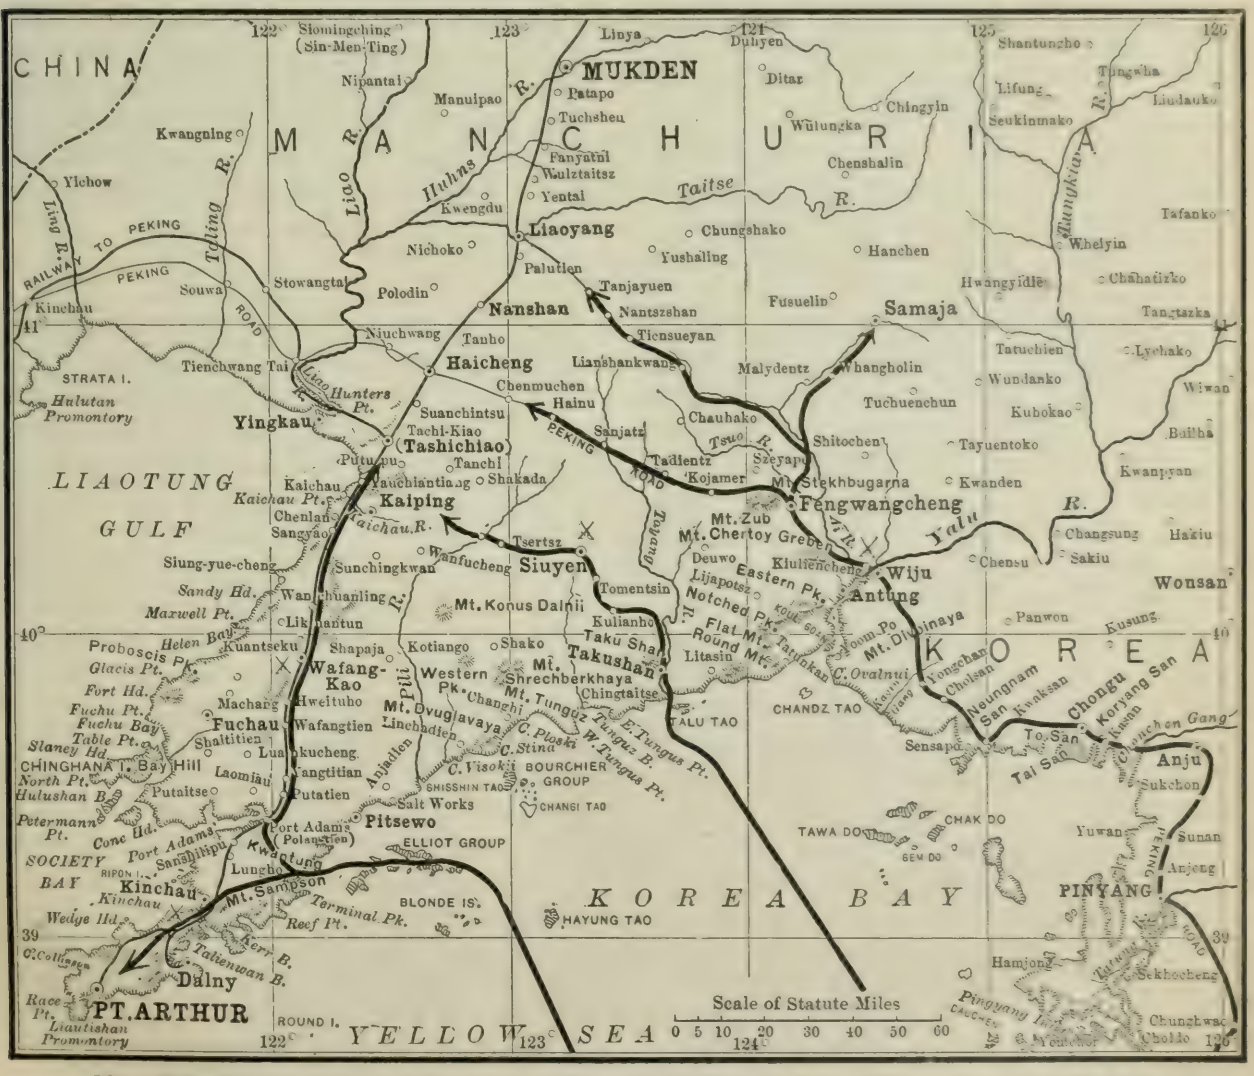
The excitement over the bribery scandals during the past week have created almost as intense feeling as the Dreyfus, Panama or Humbert affairs, but there seems to be more smoke than flame in this case and the excitement is dying down for want of fuel. Altho the Investigating Committee of the Chamber of Deputies is two-thirds composed of those in opposition to the Cabinet, they have not been able to find any evidence against Premier Combes. The Chartreuse monks claim that they were approached by men purporting to have influence with the Government, who promised them exemption from the law against the religious orders, but that they refused to pay money for this purpose. The Government, on the other hand, claims that alleged representatives of the monks offered bribes, but they were indignantly rejected. The demonstration of such virtuous conduct on both sides ought to be very gratifying to the French people, but they do not seem to see it in that light. M. Mascurand, a rich Paris merchant, was President of the Committee of Commerce and Industry which collected campaign funds for the Governmental party in the last election, and to him M. Chabert paid $20,000 as his personal contribution, with the remark that the Carthusians would probably pay two million francs to be let alone, altho he testified before the Investigating Committee that this was merely a thought of his own. M. Lagrave, the French Commissioner at the Louisiana Purchase Exposition, seems to have taken this as a formal proposition and approached the Government with it. This is practically all that the committee has established. By a majority of thirty the Chamber of Deputies supported Premier Combes and defeated a proposition of M. Millerand to discuss the bribery scandal further in the Chamber. The Budget Committee voted the suppression of the appropriation for the French Embassy at the Vatican. The Pope is reported to be relying upon the speedy fall of the present Cabinet, and, accordingly, is delaying any advances toward reconciliation in the hope of being able to a deal with a Government less bitterly anti-clerical. At Nantes the establishments of the Premonstrant and Capuchin orders were closed by the police with the aid of a battalion of infantry, a detachment of dragoons and a company of firemen. The monks barricaded the doors and windows, but the firemen forced them back with streams of water, and then carried them out by ladders.

French Fetes

A characteristic French ceremony was performed in the Eiffel Tower at the summer solstice, where, at the latitude of Paris, the sun descends only 18 degrees below the horizon and from the top of the tower twilight and dawn are one. The Astronomical Society of France gave a dinner

to a hundred savants, which was followed by a lecture on the sun by Camille Flammarion, and hymns and odes to the sun were sung and recited by the singers and actors of the national opera and theater. At midnight MM. Janssen, Lippmann, Loewy, Poincaré, Flammarion, Eiffel and a few others ascended the tower and greeted the rising sun with toasts and salutations, signaling to various parts of France by wireless telegraphy.—A festival of less fantastic character was the celebration throughout the country of the establishment of public schools in France (*La Fête de l'Enseignement primaire*). The date selected as the origin of the modern educational system was June 19th, 1872, when the petition of the people for universal education, a petition contained in 115 packages weighing nearly 500 pounds, was presented to the National Assembly by the "Committee Against Ignorance." At the Trocadero palace an audience of 5,000 persons was assembled, and, as the President of the Republic entered, they rose and sang "The Marseillaise," led by a chorus of 700 voices under the direction of a Paris inspector of musical instruction. Addresses were given by M. Ferdinand Buisson, president of the Teachers' League, and by M. Chaumié, Minister of Public Instruction, on the rise and progress of "compulsory, free and laic education" in France, after which the names were read of fifty-three teachers, men and women, who had been decorated with the Legion of Honor on the previous day. Following these exercises a banquet was given to 10,000 teachers at one time, the guests being divided into companies of 50 and the whole marshaled with French order and decorum. The significance of such *fêtes* as these lies in the manifest effort to give to scientific and public education something of the pomp and ceremony of the ecclesiastical methods which are being displaced.

Finland It is officially denied that any rioting followed the assassination of General Bobrikoff at Helsingfors. It does not appear that Schaumann was a member of any revolutionary society, or had taken any one into his confidence in regard to his project. With a friend in Stockholm he had some months ago deposited a letter to be opened in case of his death. This contained a copy of a letter to the Czar which he had upon his person when he committed suicide. Since he suspected that this letter would never reach the Czar directly, he requested the copy to be published. He was incited to his desperate deed by the thought it would bring to the attention of the Czar, as nothing else would, the real sufferings and wrongs of Finland, and by the hope that all the oppressed provinces might rise against the autocrat. The remains of General Bobrikoff were interred in the Sergieff Monastery in the presence of the Czar and the Grand Dukes. It is announced that Prince Obolensky, former Governor of Kharkoff, will be chosen to succeed him as Governor-General of Finland.



The Sinking of the "Norge" The Danish steamer "Norge," of the Scandinavian-American Line, struck on a rock eighteen miles south of the reef of Rockall, 290 miles off the west coast of Scotland, and sank twelve minutes later. Out of 775 persons, only 128 are known to have been saved. The strings of the life preservers were found to be rotten, and most of the boats which could be lowered were smashed against the side of the ship. Captain Gundel remained on the bridge and went down with the vessel, but after swimming for two hours, managed to reach a lifeboat. The passengers were Finns, Norwegians, Swedes and Danes—immigrants going to the Scandinavian colonies in our Northwestern States.

The British in Tibet It begins to look as tho the British Mission in Tibet might assume a more peaceful character again. Tongsa Poulop, a Bhutan chief, came to the camp at Gyangtse with a letter from the Dalai Lama, in which he promised to send representatives to treat with the British. This is probably in consequence of the greater activity shown by the British since the arrival of reinforcements. The convoy service was doubled and the route to India kept free from atttacks and blockades, which

were becoming more numerous and annoying as the Tibetans acquired more courage and military experience. They are also better armed than at first, and their numbers have increased to some 20,000. The road toward Lhasa was cleared and every preparation made to proceed to the capital. By four hours' hard fighting General MacDonald succeeded in taking the town of Gyangtse, with the loss of only five men killed and six wounded. The Jong or castle on the mountain top is now in British possession. The British force had not hitherto entered the town of Gyangtse, but had formed a camp about a mile distant.

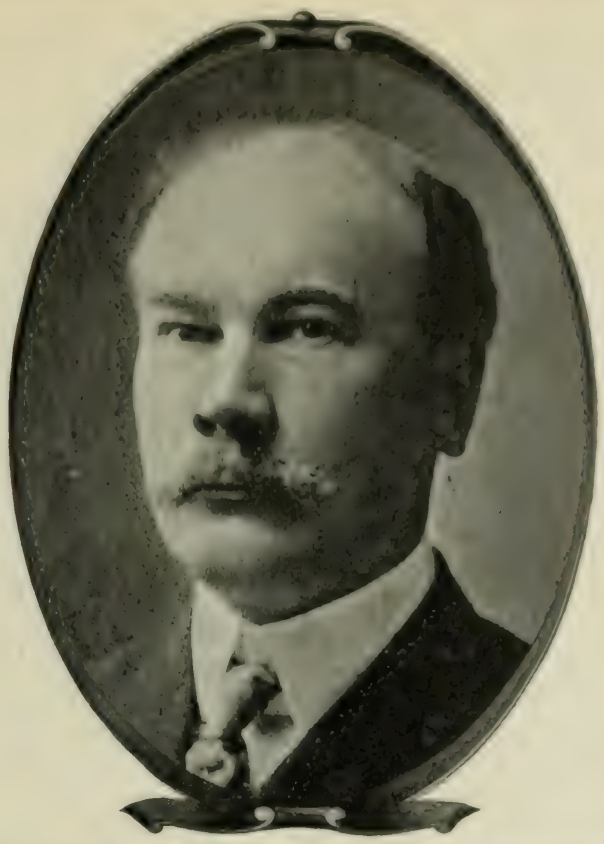
A Simple Resumé of the War

The accompanying map is designed to show in a general way the movements of the three Japanese armies invading Manchuria. The main line of march is indicated by broad lines terminating in arrow points at the furthest points reached. If a line were drawn joining these points it would outline the present Japanese front and mark the boundary of the territory now held by them. Of course, the minor movements cannot be represented. Crossed swords mark the places where the most important battles have taken place. Viewed in its larger aspects the plan of campaign as carried out by the Japanese is simple and easily grasped by the most unmilitary layman. The first Japanese army, under General Kuroki, landed at various points on the western coast of Korea, defeated the Russians at the Yalu River, which forms the boundary between Korea and Manchuria, and advanced to Feng-Wang-Cheng; from that point detachments were sent out in various directions along the roads leading to the stations on the railroad. The second Japanese army, under General Oku, landed at various points above Port Arthur on the Liao-

Map Showing the Lines of March and Present Positions of the Three Japanese Armies

Tung peninsula, and moved south to attack that point. The Russians, who had fortified the narrowest point of the peninsula near Kin-Chau, were defeated in the battle of Nan Shan Hill. Leaving a force to besiege Port Arthur, General Oku's army then turned north and drove the Russians out of the Liao-Tung peninsula; the principal engagement being at Wafang-Kao. The third Japanese army, under General Nodzu, landed at Takushan and, defeating the Russians at Siu-Yen, moved northeast and fitted in between the other two armies like the keystone of an arch. The backbone of the Russian position is, of course, the railroad from Mukden, the capital of Manchuria, to Port Arthur, which from its central position between China, Manchuria, Korea and Japan is the most important naval port in the Far East. A diary of the chief events of the war will be found in our editorial columns.

The Capture of the Passes



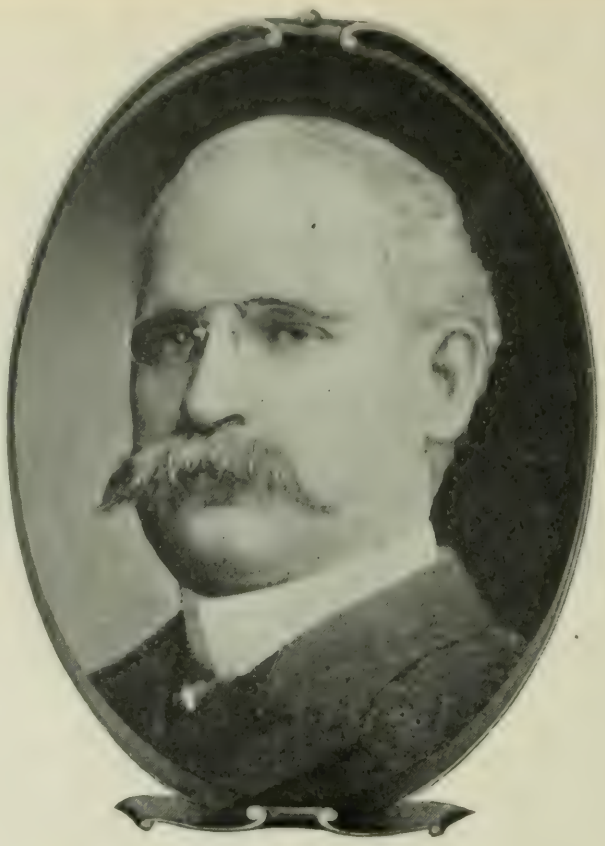
The low mountain range which separates Feng-Wang-Cheng from the railroad, and which it was thought would be utilized by the Russians as a line of defense, has been passed by the Japanese without a battle of any importance. The pass of Mao-Tien, on the road between Feng-Wang-Cheng and Liao-Yang and the pass of Ta-Ling (Dalin), on the road between Feng-Wang-Cheng and Hai-Cheng, are both strong positions naturally and had been well fortified by the Russians. The Japanese are now within twelve and twenty miles of the railroad almost all along the line, and, by threatening so many points, force General Kuropatkin to scatter his troops. In carrying the pass of Ta-Ling, the Japanese, according to Russian reports, suffered heavily in a bayonet charge on General Mistchenko's force holding that position. The Russians also claim to have been successful in holding back the Japanese along the Siu-Yen and Kai-Ping road, and to have killed 600 men in numerous skirmishes. The rainy season is now on, and the roads are muddy and flooded, so as to be impossible for artillery and supply trains. The Russians state that cholera and dysentery are prevailing in the Japanese army and there is scarcity of food. The charges made by the Russians of mutilation of bodies on the battlefield are indignantly repudiated by the Japanese.

The Vladivostok Squadron

The Vladivostok squadron, consisting of the cruisers "Rossia," "Rurik" and "Gromoboi," and nine torpedo boats, made another raid down the east coast of Korea, and succeeded for the third time in dodging Admiral Kamimura and regaining the port. The only harm done to the Japanese this time was the shelling of the town of Wonsan, Korea, and the sinking of two small vessels in the harbor. Vice-Admiral Kamimura's fleet was off the south coast of Tsu Shima on the night of July 1st, when the Russian squadron passed to the north of Iki Island, taking advantage of the mist and rain. When about ten miles away the Russian squadron was sighted and Kamimura gave chase at full speed and pursued it northeastward. When they came within five miles of the enemy their lights were suddenly extinguished and they escaped in the darkness. The torpedo boats had no chance to discharge their weapons. Some 600 shells were discharged at Wonsan.

Port Arthur

The Japanese are reported to have landed 10,000 men at their naval base on the Elliot Islands, whence they may be sent either to reinforce General Oku in the upper part of the Liao-Tung peninsula or General Nogi, who is besieging Port Arthur. Siege guns have been landed at Dalny, and are being placed upon the hills around Port Arthur, which the Japanese have been taking one by one for the last two weeks. In these operations they are assisted by long range fire from the cruisers in Talien-Wan, the harbor of Dalny. Admiral Togo reports that on the night of June 27th a torpedo attack at the entrance to the harbor resulted in the sinking of a Russian guardship and a torpedo boat destroyer, with a loss on the Japanese side of 14 men killed. The report is not confirmed from Russian sources.



PAUL
MORTON

President Roosevelt's selection of Mr. Paul Morton as Secretary of the Navy marks the rise of a sturdy American boy, endowed with a bountiful supply of good sense and untiring industry, from an obscure place to one of the highest positions in the National Government. His selection is due entirely to his excellent judgment, his business-like methods, keen perception and determination to do the right thing at the proper time. His methods captivated the President, who desired to secure the valuable services of the competent railroad man.

Mr. Morton was born at Detroit, Mich., forty-seven years ago, and is the son of J. Sterling Morton, the Secretary of Agriculture during President Cleveland's first administration. He began life with a common school education and at the age of fifteen was a low-salaried clerk in a railroad office. His remarkable ability and genial manners were responsible for his success, and his promotion was rapid. Mr. Morton is of striking physical appearance, being six feet tall and well proportioned, having a deep chest, broad shoulders, and weighing 180 pounds. His head is well formed, his brow broad and his nose is prominent, which indicates his strength of character. His mouth is firm and his hair and mustache are sandy and tinged with gray. His eyes are blue. He is extremely modest and seldom speaks of himself. He is a congenial gentleman and a good story teller; is excessively fond of outdoor sports, is an excellent horseman and plays golf well. For years Mr. Morton and President Roosevelt have been close friends, having many points in common, and the new Cabinet Minister has always been a welcome visitor at the White House during the present administration. He enjoys the distinction of having, several times, declined to enter the President's Cabinet. Mr. Morton is intensely American, and this fact attracted the President to him. He is not a politician in the strict sense of the word, but has always taken great interest in the welfare of the country. He is a strong believer in the employment of clean political methods, and his presence in the Cabinet will promote decent politics. Until recently he was a Democrat, and during the campaign of 1896 aligned himself with the conservative element of his party and voted for the Palmer and Buckner ticket.

Secretary Morton began his railroad career in 1872 with the Burlington system and remained with it until February 1st, 1890. His first service was as a clerk in the land department of the B. & M. R. R. at Burlington, Iowa, and his superiors recognizing his great ability promoted him rapidly. His wonderful grasp of affairs, his quickness in reaching a decision and executing his plans promptly brought about his promotion to be the Assistant General Freight Agent of the Chicago, Burlington & Quincy Railroad, General Passenger Agent, and later General Freight Agent. From 1890 to 1896 he was Vice-President of the Colorado Fuel & Iron Company and President of the Whitebreast Fuel Company. From 1896 to 1898 he was Third Vice-President of the Atchison, Topeka & Santa Fé R. R., and since 1898 he has been its Second Vice-President. Since his promotion he has dictated the policy of the road, and its success is due largely to his wonderful executive ability. This varied experience has well equipped Mr. Morton for his position in the Cabinet, and his friends predict for him a decided success. In 1880 Mr. Morton married Miss Charlotte Goodridge, and two charming daughters were the fruits of this marriage. One of them is married and will not make her home in Washington, but the unmarried daughter, Pauline, will accompany her parents, and the Morton family will be a distinct acquisition to the Cabinet circle.

VICTOR
HOWARD
METCALF

Victor Howard Metcalf, who assumed the duties of Secretary of Commerce and Labor on July 1, is fifty years of age, a native of Utica, N. Y., a graduate of Yale Law School, and a lawyer by profession. In personal appearance Mr. Metcalf is youthful and vigorous despite the growing thinness of his iron-gray hair. He has been an athlete all his life, and is usually in the pink of condition for strenuous work. It was their love of athletics and outdoor life that led Mr. Metcalf to form a close attachment to William H. Moody, late Secretary of the Navy and now Attorney-General. They struck up a friendship in the House, where Mr. Metcalf served as representative of the Third California District and Mr. Moody as representative of the Sixth Massachusetts District. Mr. Metcalf's stalwart regimen was one of the things, also, which attracted President Roosevelt to him, and during the past three or four sessions of Congress they have become warm personal friends.

After studying law with Francis Kernan and Horatio and John F. Seymour, and after his admission to the bar, Mr. Metcalf went to Oakland, California, where he has resided since 1879. He practiced at first in partnership with the late Hosmer P. McKoon, who was well known in New York State, and in 1881 formed a partnership with a namesake, but not a relative, George D. Metcalf, which has continued ever since. The firm of Metcalf & Metcalf has had charge of important corporation suits, land cases and general practice, in which both members of the firm have acquired fortunes.

Mr. Metcalf was elected to the Fifty-sixth Congress by a big majority, his district having the largest Republican vote in California. He was re-elected to the Fifty-seventh Congress by an increased majority, and to the Fifty-eighth Congress by a majority of 10,000, more than ever before. Mr. Metcalf served on the Committee on Naval Affairs, where he displayed conspicuous ability, which earned for him appointment on the more important Committee on Ways and Means. There his legal training and searching inquiry into questions presented to the committee gave him a high standing in the House.

Mr. Metcalf has distinctly a legal mind. His mental attitude on public questions is judicial and philosophical rather than partisan. His Republicanism, however, is strengthened by his intense admiration of Theodore Roosevelt. He has by his vote and his public speeches heartily indorsed the action of the President on all important public affairs, and is a warm admirer of the President's personality. No member of the Cabinet will be a more loyal and enthusiastic supporter of the President than the Californian who becomes the head of the Department of Commerce and Labor. The new Secretary has given abundant evidence, also, of grit and persistence in adherence to duty, which will become more evident in his dealings with affairs in the new Department. It is no reflection upon Mr. Cortelyou to say that in equipment for developing and strengthening the Department of Commerce Mr. Metcalf is far ahead of him.

Mrs. Metcalf, wife of the Secretary of Commerce and Labor, is one of the popular hostesses of Washington. The Metcalfs have lived at the Arlington during the sessions of Congress, and have entertained considerably, though without ostentation. The new Cabinet household will be one of the charming circles that are the delight of visitors to Washington. Mr. and Mrs. Metcalf have two sons, one of them being a midshipman at the Annapolis Naval Academy.

A World's Congress

THE NEXT STEP AFTER THE HAGUE COURT

BY HAYNE DAVIS

[The subject of the following article by Mr. Davis is of the very greatest importance. This is the Exposition year, and leaders of thought from all civilized nations are meeting in a series of world congresses at St. Louis to consider the problems of science and philosophy. Why should not President Roosevelt call a conference of the nations to create an international legislature whose establishment would mark greater progress than The Hague Court?—EDITOR.]

EXACTLY a year ago I printed, in the Fourth of July issue of THE INDEPENDENT, an article entitled "The Final Outcome of the Declaration of Independence." In that article I tried to show that "The Americanization of the World" is the ultimate outcome of the forces now operating in world politics, and that the establishment of The Hague Court of Arbitration by the principal nations of the world is the preliminary step toward that end. In the following article I hope to show that the founding of The Hague Court, however glorious was that event, is insufficient of itself to bring about peace on earth, and that the next step in the political progress of mankind is the founding of The World's Congress, Tennyson's "Parliament of Man." I propose also to discuss the constitution and functions of such a Parliament. Should it be established now? How should it be constituted? What powers should be delegated to it?

First, as to the adequacy of The Hague Court for filling the needs of our times. That Court is manifestly incapable of preserving the world's peace. The Conference, which created it, had hardly dissolved before the Boer War broke out. When it convened to render its decision in the Venezuela case war between Russia and Japan was raging. The very decision in the Venezuela case shows how a premium is set on violence, by the Law of Nations as it stands to-day. For the Court held that the blockading allies were entitled to priority of payment, altho, after the resort to force, all claims were referred to arbitration, and the debtor assigned property for the payment of all creditors. Unfortunately, and most unreasonably, this decision has shaken the confidence of the people in arbitration as a means of justice. The Hague Court is not responsible for this rule of the Law of Nations. The nations are responsible for this being the law now, and the antiquated method of amending International Law—common consent—will be responsible for its remaining the law. The sentiment of the world is so strong against the decision that if there were an International Congress, through which this sentiment could express itself, a law would soon be passed forbidding resort to force in the collection of an unadjudged claim against a nation, and enabling a debtor nation to provide for *pro rata* payment to all creditors, when unduly pressed by any one.

With such a Congress to declare the principles of Law for the conduct of international affairs, and with The Hague Court to apply the Law to disputes as they arise, the political organism thus formed would become, for the nations, what the United States is for the American States. But The Hague Court alone is hopelessly inadequate for peaceful and just government of the world, as our Supreme Court would be for America if there were no Federal Congress to make the Law in interstate affairs, and if the States were free to resort to the Court or to war, as they might prefer, in every controversy.

Hence, in facing the insufficiency of The Hague Court, we are confronted with strong reasons for the creation of a World's Congress to supplement this Court. It may be questioned whether it is worth while to discuss the forming of such a Congress before The Hague Court is sufficiently established in the confidence of the nations to become the resort for trial of all controversies, instead of the battlefield. The history of trial by battle in England furnishes the answer. The English Government was established in its present form, with

legislative, judicial and executive departments, long before the right of English citizens to make private war on each other, by wager of battle, was forbidden. The first Representative Parliament met in England in 1253. At that time it was lawful for citizens of England to prove title to land by evidence to a jury *or by personal contest* with the adverse claimant. If either party demanded the right to try by battle, the Court was bound to order trial in that way and to give judgment for the victor. This right of trial by battle, at the election of either party to a controversy over land, was not abolished until the 22d day of June, 1819. So that the right of individuals to wage battle in England lasted for nearly six centuries after the creation of the English Parliament. Even so, war between nations will continue after the creation of an International Parliament. But the sooner the Parliament comes into being the sooner war will come to an end. Therefore, the World's Congress should be created as soon as possible.

The timeliness of establishing it now will still more plainly appear by examining in the light of this bit of English history the present political and industrial conditions of the world, and comparing them with the conditions which gave birth to the United States a century ago, with its carefully designed legislative, judicial and executive departments.

When the condition of the Colonies became unendurable because they were denied due voice in their local affairs, there were no railroads, no steamboats, no telegraph lines. The Colonies were separated by wide stretches of uninhabited country. There was little difference in time between Boston and Charleston, and Boston and England. Then information traveled no faster than people. Nevertheless, when news of war between Massachusetts and England reached the other Colonies, they all resolved to be no longer under the dominion of England. Each Colony became a State when it made this resolve. Then all the States joined in the Declaration of Independence and in the formation of the United States, under the Articles of Confederation, and by united effort they won the war. But the Articles of Confederation did not create a nation as did the Constitution, adopted in 1789. They bound together thirteen States, more for war with England than for the government of America. And the success of the Revolution practically confirmed the thirteen Colonies as thirteen sovereigns. Long misgovernment by a distant Power had made them loath to surrender any of their rights of self-government, for which they had paid so great a price. The States were really not properly united, under the Articles of Confederation, for the government of America. And the first tendency after the surrender of Cornwallis in 1781 was toward separation. But the real welfare of all the States lay in surrendering a part of the newly acquired sovereignty to a political authority formed by their union. And during the decade following the Revolution pamphlets (the counterpart of magazine articles of our day) began to appear advocating a suitable union of the States.

In 1786 a conference which convened at Annapolis called upon the Congress, under the Articles of Confederation, which was then in session, to request the Colonies to send delegates to a conference to devise some means of rendering the Confederation adequate to the needs of the people. Twelve of the States sent delegates, who assembled at Philadelphia (except the delegate from New Hampshire) on the 29th day of May, 1787. There was a long struggle in the convention before the terms of a Constitution could be agreed upon. There was fierce conflict in some of the States before the Constitution could be adopted. Alexander Hamilton said:

> "The establishment of a Constitution in time of profound peace, by the voluntary consent of a whole people, is a prodigy to the completion of which I have looked forward with trembling anxiety."

The period of travail was three years to a day from the assembling of the Constitutional Convention to the adoption of the Constitution by the thirteenth State, Rhode Island, and the vote in that State was 34 to 32. Thus the prodigy was brought forth.

In order that we may understand the great light which thus arose in America for the solution of the problems now casting the darkest shadows over the

world, it is necessary to bear in mind that the foundation of the United States is not government by the people. That is the foundation upon which the States are built. The foundation on which the Union rests is *national sacrifice,* the duty of sovereigns to surrender a part of their sovereignty when the general welfare calls for this.

When the Revolution was ended, confirming the Colonies in their claim to independence, there were many interests common to all of them; and the preservation of these interests demanded a more perfect union than existed under the Articles of Confederation. Science and invention have done in the nineteenth century what our Revolution did in the eighteenth—placed sovereign political bodies in contact too close for permanent independence. But a suitable union of States could be formed then, and of nations now, only by the renunciation of some of the rights of sovereignty.

The time has come for the nations to make a sacrifice corresponding to the sacrifice made by the American States a century ago. There was no more reason for organizing the United States in the twilight of the eighteenth century than now exists for adding a Legislative Branch to the existing Union of Nations. Since the formation of the United States laws of nature have been discovered and applied to human affairs which make the nations nearer neighbors now than the States were a century ago. None of the forces which conspired to form "United States" here and in various parts of the world, during the past century, have lost their value. On the contrary, new and powerful forces have been brought into play, and the whole system of forces intensified in their operation.

It is doubtful if half of mankind knows anything even now of America's Declaration of Independence. President Roosevelt's cablegram, circling the earth in twelve minutes, exactly 127 years later, was a declaration of humanity's freedom from the limitations of time and space. The day after this message was sent a great part of mankind became conscious of the fact. These incidents alone illustrate how the past century has changed the conditions of the world, and prove how intimate and incessant future intercourse between nations will be.

The nations thus brought into touch with each other are a mutual menace, and the first effect of bringing them so close together is to increase national preparation for war. But not content with the prospect of continual preparation for and periodical devastation by war, the nations are beginning to enter into treaties of arbitration for judicial determination of questions as they arise. This desire for peace has manifested itself most conspicuously in the establishment of the Permanent Court of Arbitration at The Hague. Indeed, it may be fairly claimed that National Preparation for War, Execution of General Arbitration Treaties, and International Organization for Peace, are the three greatest political movements of our time, all being necessitated by the present proximity of nations. If we consider each of them in relation to the world's welfare, we will see that International Organization for Peace is the greatest of these and that a World's Congress as one part of this world organism is essential to the world's peace.

National Preparation for War is necessitated by the fact that every nation is brought face to face with all the nations, any one or several of which may become hostile at any moment. Some nations have already gone to great lengths in preparation for war, and there is much agitation on the subject in every part of the world. France's war preparation is greater to-day, in time of peace, than Napoleon's was in the midst of his largest operations. Why? Simply because all nations have been brought into striking distance of France since Napoleon's day. But National Preparation for War cannot look beyond the War Era, tho some of its advocates look upon it as a means of preserving peace. It is, at best, however, a mere makeshift, until something better can be devised and put in successful operation.

And something better has already been devised, and is now engaging the foreign offices of all the nations of the world: for in the night of the War Era Arbitration Treaties are beginning to appear, like stars. In South America, Argentina is the center of this movement, treaties

between Argentina and several other nations having been executed and put into operation. In Europe, France is the center of the movement, treaties having been entered into between France and England, France and Italy, France and Spain, and several other treaties being in course of negotiation. In so far as the arbitration movement is intercontinental, Spain is the center, for almost a dozen arbitration treaties are now being negotiated between Spain and South American nations, and some of them have been completed and put in operation. It may be confidently predicted that this movement will reach great proportions during the coming decade, and will take us far toward the Era of Peace.

But arbitration treaties will not suffice. First, because every nation must enter into such an agreement with every other one, or war will come despite them. Argentina is free from danger of war with Chile, Paraguay or Uruguay, but liable to war with all other nations; and Chile, Paraguay and Uruguay, tho bound to peace with Argentina, are liable to war among themselves, as well as with all other nations. Even if one nation had protected itself from danger of war by arbitration treaties with every other nation, all the other nations would be liable to outbreak of war among themselves. And such an outbreak injures all nations: those that are involved in the struggle suffer most, but none can escape the evil consequences of the existence of a state of war.

The welfare, the peace of the world necessitates, therefore, a political organization coextensive with man's widest commercial activities, competent to prescribe rules for the conduct of international intercourse, and to adjudge controversies growing out of it.

The embryo of such an organization has come into existence without our realizing it. The Hague Court being really the Judicial Department of the United Nations, of which twenty-six nations are members. But in order that The Hague Court may become for the nations what our Supreme Court is for the States, it must acquire the right to summon nations to appear before it, and a Parliament of Nations must be created, to declare the principles of right which this Court of Nations may apply to the controversies which arise.

Having briefly discussed some of the reasons that seem to make the time ripe for an International Parliament, and its establishment a thing to be desired, let us consider what powers should be delegated to it.

It might seem useless to create such a body without giving it some authority, and yet, even without authority, good would come from its mere creation. Ordinarily, when a private citizen is made a public officer his eyes are lifted from merely private affairs, and directed to the welfare of the people whose officer he has become. Unless this happens the man is apt to become a corruptionist, and is certain to prostitute his public position to private ends. In every State Legislature there are some who do not see far beyond the limits of the district they represent. Others have an eye to the interests of the people of the whole State. Likewise there are national legislators whose vision is limited by the State they represent or misrepresent. The large men rise above State and section, and look to the interest of the nation. In doing this their eyes are apt to become fixed on the points of conflicting interest between their nation and other Governments. The protective tariff and such laws are an outcome, supposedly in the special interest of the nation enacting them. But the moment you transfer the good national legislators to an International Congress they will begin to seek and discover the interests common to all nations. This alone is reason enough for creating an International Congress, for it will be in a position to create sentiment on international affairs, and the creation of a sentiment must precede the enactment of a law. Create a sentiment and it will enact itself into law sooner or later.

But the Congress of Nations should be given authority to initiate legislation, its resolutions to become operative when approved by, say, four-fifths of the nations, representing four-fifths of the population, or when not vetoed by one-fifth of the Nations, representing at least one-fifth of the population.

During the life of our Articles of Confederation it was found that State Legislatures took little notice of recommenda-

tions, however wise, which emanated from the Federal Congress. Preoccupied with resolutions of their own, which would become law unless resisted, for those who introduced them were present to press for their passage, they neglected the resolutions of Congress. In creating the International Legislature it would be better, therefore, to provide that the resolutions become operative unless vetoed within a given time by an agreed number of nations. This would put the inertia of those bodies on the side of the International Congress. And, therefore, the resolutions of the latter would become a part of the Law of Nations, unless there proved to be a strong sentiment against them. This would enable the people to correct any error of the International Congress by the action of their National Legislatures. And if there was not enough opposition to a proposed Law for the nations to find expression in several National Congresses, no harm would probably come from its enactment. This would give the principle of Initiative and Referendum a place—what seems to be a suitable place—in international affairs.

Whether created with or without authority, this International Congress would take up immediately such questions as were raised at The Hague, and not acted upon favorably, for instance:

LAWS OF WAR:

Immunity of private property during war.
Rights and duties of neutrals.
Type and calibre of arms.
Bombardment of ports, towns and villages.
Limitation of land and naval forces.
War appropriations.
Collection of money claims against a nation, etc.

Under the Articles of Confederation Congress was empowered to fix the war status of each State separately. At the same time the United States guaranteed the sovereignty of each State. But the making of such an agreement between nations is not as simple as it was between American States. The American States were all Republics and believed to be firmly established, whereas there are many kinds of nations, some of which are known to contain the seeds of revolution. Other nations should not, and certainly the United States would not, be willing to guarantee all nations as they are now organized against an internal revolution. Hence, each nation should be free to work out its own national destiny, in passing from its present to the final form of government, in which each individual and community is allowed due voice in both local and general affairs. This seems to necessitate that each nation judge for itself as to the war and naval preparation necessary for its own preservation, for a long time to come. There is, however, one principle applicable to each of the other subjects enumerated above, which would be equally beneficial to all nations if enacted into a law.

Take, for example, the collection of claims against a nation. It would be to the interest of all nations if it were enacted that no forcible action be taken to collect an unadjudged claim against a nation. The Venezuelan incident discloses the reasons. If the claims against Venezuela had been submitted to a tribunal in which the American people had confidence, and had been adjudged just, before force was resorted to, the United States would have thought that Venezuela ought to pay the debt, and we could hardly have been drawn into war on account of force put upon her to require payment. But if war had grown out of the attempted forcible collection of these claims, instead of their reference to the Court of Arbitration, it is difficult to see how our people could have kept out of the strife. No matter how just the claims may have been, the American people would have distrusted them and the motives of the European Powers.

It is essential to peace that no nation resort to force in the collection of a debt which has not been adjudged just by a Court of Arbitration. And it is reasonable to suppose that the establishment of an International Parliament would be soon followed by the incorporation of this idea into the Law of Nations. This, alone, might prevent a world conflict, and would justify the creation of the Congress. A nation that refused to pay a judgment rendered by the Court of Arbitration would meet with no sympathy from any of the Powers. And, even if force had to be resorted to in order to collect the judgment, there would be no danger of a general conflict. The debtor nation would simply be involved in war

owing to its obstinacy, and unless it won the victory, would be placed in the debtors' prison till the judgment and costs were paid. This would only take nations through the path which individuals have trod, in their journey to integrity and solvency.

But in addition to authority to initiate legislation on all subjects, why should not the International Congress be given some authority at the outset—for instance, authority to continue the work begun by the great International Marine Conference, called to systematize the rules of ocean navigation?

Why should not such a Congress have real control of postal and cable communication between nations, also authority to fix a standard of weights and measures for use in international commerce, and to determine the question of exchange between nations using silver as a basis and those using gold—a question which has recently received consideration by an International Commission? Indeed, the International Congress might well be given power to regulate commerce between the nations, its enactments to apply uniformly throughout the Union thus constituted. The International Congress could be given power to regulate this commerce, and The Hague Court the right to decide all questions growing out of it, and yet each nation remain free to abandon its present tariff policy when it sees fit to do so. The Articles of Confederation left each State free to prohibit the importation or exportation of any species of goods or commodities, free also to impose impost and duties on foreigners. Certainly the enactment of rules for the conduct of such commerce as the nations allow, and the right to adjudge questions growing out of this commerce, ought to be conceded to the Union of Nations ultimately, and there seems to be no good reason why it should not be done at the outset. These and many other interesting questions present themselves, when we seriously consider the creation of a more perfect Union of Nations by convening an International Congress. And in giving thought to them we really begin to walk in the mental path trod by the founders of the United States.

But, after determining what powers should be ceded to the International Congress, the question arises, How shall it be constituted? The Articles of Confederation, as well as the present Constitution of the United States, are interesting in this connection. While united under the Articles of Confederation, each State was entitled to elect annually not less than two, nor more than seven, men to represent it in the Federal Congress, which was composed of only one body or House. Each State was at liberty to recall any of its representatives at any time, and was bound to maintain them. But the States were prohibited from sending the same individual to the Federal Congress for more than three years in any term of six years. The meeting of this Congress was to be annually in November, and each State was entitled to one vote, no matter what the number of the delegates, and for most things a vote of nine States was necessary. We are all familiar with the changes made when the present Constitution was adopted, but it is worth while to state them. The Congress was divided into two Houses. Each State was guaranteed an equal representation in one (which can never be taken away without the unanimous consent of the States) and a representation proportionate to population in the other. Instead of the vote being by States, each Representative has one vote.

The International Congress should be constituted in some respects as was the Federal Congress under the Articles of Confederation. To begin with, there need be only one House, unless it is intrusted with large powers. The number of Delegates from each nation should be fixed, and each Delegate should have a vote instead of the vote being by nations. When the vote is by states or nations each delegation becomes a little Government in itself, for which meetings and methods of procedure would be necessary, and this would seriously hinder the action of the main body. Committees are the only reasonable subdivisions of such a body.

As to the number of delegates from each nation, it is interesting to recall that in the Grand Republic designed by Henry the Great of France the nations were divided into two classes; the first class to have four delegates, the second

class two, to be chosen for three years by the nation they represented. The Powers then regarded as worthy of four delegates were the Roman Emperor, the Pope, France, Spain, England, Denmark, Sweden, Lombardy, Poland and Venice. How are the mighty fallen! There is no Roman Empire. The Pope has no territory to give him standing in such a Union of Nations. Lombardy, Poland and Venice have become subsidiary parts of other Governments. It is strange to think of Denmark and Sweden as placed on an equality with England or France. Spain, then the great Power, is now among the lesser ones.

Four delegates from Powers having over twenty million people, and two from those having less, would give a House with about 100 members, each of the following having four delegates: Austria-Hungary, China, France, Germany, Italy, Russia, Spain, Turkey, England and the United States. Allowing one delegate for each nation, two for those having five million people, three for those having fifteen million, four for those having thirty million, five for those having fifty million, six for those having eighty million, seven for those having one hundred million, eight for those having one hundred and fifty million, nine for those having two hundred million, and so on—each increase of fifty million entitling the nation to one more delegate would keep the number down to about 100—and the representation of nations having more than one delegate would be as follows:

Fifteen nations would have.One delegate each.
Nations having.....Two delegates each.
Belgium,
Netherlands,
Portugal,
Rumania,
Norway and Sweden,
Persia,
Siam,
Argentine.
Nations having.....Three delegates each.
Spain,
Turkey,
Korea,
Mexico,
Brazil.
Nations having.....Four delegates each.
France,
Italy.
Nations having.....Five delegates each.
Austria-Hungary,
Germany,
Japan.
Nations having.....Six delegates each.
The United States,
Russia.
Nations having.....Nine delegates each.
China.
Nations having.....Twelve delegates each.
Great Britain (five for her own domains and seven as representative of India).

Representation should readjust itself automatically prior to every election, so as to correspond to the population at that time, so far as known. Growth in population would make the body too large after a time, but this could be provided against by arranging that when the number of members reached 125 the population entitling a nation to more than one delegate shall be twice that shown above. For instance, ten million people instead of five would be necessary to entitle a nation to two delegates; thirty million, instead of fifteen, for three delegates, etc.

But volume of international trade would really be a better basis than population on which to found representation. It is this trade which calls for the Congress. Its chief duty will be the formulation of rules for the conduct of this trade, and for the settlement of injuries arising out of it. Allowing each nation one delegate and apportioning the remainder of the 100 members according to the volume of international trade would be the justest and also the easiest rule in its application. Every year the customs records of the nations would show their standing, and thus no difficulty occur in the apportionments. Dividing the total international commerce by one hundred would give the unit of representation. Nations having a volume of trade in excess of this would be entitled to share in the distribution of the extra members and in proportion to their excess. Persons as well as property ought to be taken into account, and a record of the citizens of one country traveling in others could be kept, and a basis of relation between persons and property fixed. The estimated expenditure per head would do as a basis, tho the verdicts for damages in case of loss of life would be a better basis. Each person might be considered as equivalent to fifty thousand dollars of trade. On this basis Belgium would have a larger representation than Aus-

tria-Hungary. Denmark almost the same as Spain or Japan. England would stand first, Germany second, United States third, France fourth, the Netherlands fifth, Belgium sixth, Austria-Hungary seventh, Russia eighth, etc. It may seem commercial rather than human to base representation on money instead of on men, but the inalienable rights of men are protected by the local Governments. Only international commerce and such things as grow out of it will fall under the jurisdiction of the Union of Nations; hence, each nation's international trade is proportionate to its interest, and, therefore, should be proportionate to its representation in the Union of Nations. A nation with only a million men doing five million dollars' worth of international trade has more interest in international affairs than a nation with five million men and only doing one million dollars' worth of trade. As soon as the larger population bestirs itself internationally and enlarges its trade, it would at once become entitled to a larger representation.

As to term of service, eight years, with privilege of recall at any time by the nation represented, would seem reasonable, and alteration of standing in international trade would necessitate recall of one or more delegates. So far from putting any restriction on sending the same individual continuously, it would seem best for all concerned that each nation find, and then keep for a long time in this body, its most competent representative. Certainly, each nation should be left free to choose its delegates in any way it may prefer.

Once in two years would seem to be frequent enough for meetings, but the Congress itself should be free to meet oftener if it desires, and at a place designated at the last meeting. When this Government was formed the Congress met at one place and then another, before its home was finally located at Washington. The Congress of the United Nations may well do the same thing. A distinct advantage would come from its meeting in various capitals before finally settling in its permanent place. It would benefit the members to come in touch with the Governments and people of the other nations, and it would popularize the idea of a Universal Government with the masses in each nation at which one of its sessions were held, and thus hasten the day when the powers of this Congress could be properly enlarged so as to make it more useful.

The Articles of Confederation contained a clause to the effect that the Constitution could be amended only by unanimous consent. The Treaty of The Hague is really the first Constitution of the United Nations, and by its terms any nation may go out of the Union of Nations by giving one year's notice of its intention. When the Union of Nations is made more perfect by the creation of a Legislature to correspond to this Court, the right of secession should remain, but the length of notice required should be three or five years, instead of one.

When the International Congress comes into being the nations will have entered upon an era corresponding to the thirteenth century in England. There will be a Legislature to declare and a Court to apply the principles of Law, but the members of the Union will be free to settle some controversies by war. The transfer of questions from the list of those triable by war to the list triable by the Court will take place as rapidly as the sentiment of the people justifies, and the authority of the Congress will grow naturally, until there shall be at last a perfect authority, co-extensive with every set of human interests, and a due voice in each authority for every person or community concerned.

With such an international political organization properly formed and developed, citizens of the United States, for instance, would express their political voice in three bodies—a State, a National and an International Legislature. The authority of the legislature of an American State would remain exactly as now. The perfect powers of the United States Congress would remain unimpaired. The imperfect powers of each National Congress (the control of international affairs) would be delegated to a body having a perfect power in such affairs, and each nation would have a due voice in this body. It would really amount to a transference of all Foreign Relations Committees to one place, with an understanding that when they

cannot agree the difference be put to a count of votes, instead of a contest between armed forces. Seen in this light, it does not seem so great an undertaking. Still, it will be the final fulfilment of the great political work which was conceived in great minds centuries ago, for which all the intervening years have been preparing the way, and which lies immediately ahead of those who begin life with the twentieth century.

There was a time when there was no Parliament in England. Conditions called for such a body and it came into existence. A day came for the United States to become a reality and it sprang into life. The day came for a Court of Nations to be constituted and it was constituted. The day is near at hand for the establishment of a World's Congress to supplement this Court, and it will come into being and then find its proper place and power in the life of mankind. Will the Government of the United States obtain the glory of initiating this great movement?

NEW YORK CITY

The Valley Forge Speech

BY THEODORE ROOSEVELT

[President Roosevelt's speech, delivered on June 19th at Valley Forge, Pa., has not received the attention from the press which it deserves. We have been especially interested in it on account of what is said by our present President of the character and aims of the two greatest of his predecessors. The following is an authentic and corrected copy of the full address and was sent to us in response to our personal request of the President.—EDITOR.]

IT is a great pleasure to come here this afternoon and say a word on behalf of the project to erect a memorial chapel on this great historic site. Three weeks ago I was at the field where the bloodiest and most decisive battle of the Civil War was fought, and it is a noteworthy thing that this State of Pennsylvania should have within its borders the places which mark the two turning points in our history—Gettysburg, which saw the high tide of the Rebellion—Valley Forge, which saw the getting beyond the danger point of the Revolution.

There have been two great crises in our national history—two crises where failure meant the absolute breaking asunder of the nation—one, the Revolutionary War; one, the Civil War. If the men who took to arms in '76 for national independence had failed, then not merely would there never have been a national growth on this continent, but the whole spirit of nationality for the younger lands of the world would have perished still-born. If the men of '61 had failed in the great struggle for national unity it would have meant that the work done by Washington and his associates might almost or quite as well have been left undone. There would have been no point in commemorating what was done at Valley Forge if Gettysburg had not given us the national right to commemorate it. If we were now split up into a dozen wrangling little communities, if we lacked the power to keep away here on our own continent, within our own lines, or to show ourselves a unit as against foreign agression, then, indeed, the Declaration of Independence would read like empty sound, and the Constitution would not be worth the paper upon which it was written, save as a study for antiquarians.

There have been other crises than those that culminated during the war for independence and the great Civil War. there have been great deeds and great men at other periods of our national history, but there never has been another deed vital to the welfare of the nation save the two—the deed of those who

founded and the deed of those who saved the republic. There never has been another man whose life has been vital to the republic save Washington and Lincoln. I am not here to say anything about Lincoln, but I do not see how any American can think of either of them without thinking of the other, too, because they represent the same work. Think how fortunate we are as a nation. Think what it means to us as a people that our young men should have as their ideals two men, not conquerers, not men who have won glory by wrong-doing, not men whose lives were spent in their own advancement, but men who lived, one of whom died, that the nation might grow steadily greater and better—the man who founded the republic and took no glory from it himself save what was freely given him by his fellow citizens, and that only in the shape of a chance of rendering them service, and the man who afterward saved the republic, who saved the State, without striking down liberty. Often in history a State has been saved and liberty struck down at the same time. Lincoln saved the Union and lifted the cause of liberty higher than before. Washington created the republic, rose by statecraft to the highest position, and used that position only for the welfare of his fellows and for so long as his fellows wished him to keep it.

It is a good thing that of these great landmarks of our history—Gettysburg and Valley Forge—one should commemorate a single tremendous effort and the other what we need, on the whole, much more commonly, and what I think is, on the whole, rather more difficult to do—long sustained effort. Only men with a touch of the heroic in them could have lasted out that three days' struggle at Gettysburg. Only men fit to rank with the great men of all time could have beaten back the mighty onslaught of that gallant and wonderful army of Northern Virginia, whose final supreme effort faded at the stone wall on Cemetery Ridge on that July day forty-one years ago.

But, after all, hard tho it is to rise to the supreme hight of salf-sacrifice and of effort at a time of crisis that is short, to rise to it for a single great effort—it is harder yet to rise to the level of a crisis when that crisis takes the form of needing constant, patient, steady work, month after month, year after year; when, too, it does not end after a terrible struggle in a glorious day—when it means months of gloom and effort stedfastly endured, and triumph wrested only at the very end.

Here at Valley Forge Washington and his Continentals warred not against the foreign soldiery, but against themselves, against all the appeals of our nature that are most difficult to resist,—against discouragement, discontent, the mean envies and jealousies and heart-burnings sure to arise at any time in large bodies of men, but especially sure to arise when defeat and disaster have come to large bodies of men. Here the soldiers who carried our national flag had to suffer from cold, from privation, from hardship, knowing that their foes were well housed, knowing that things went easier for the others than they did for them. And they conquered because they had in them the spirit that made them stedfast, not merely on an occasional great day, but day after day in the life of daily endeavor to do duty well.

When two lessons are both indispensable, it seems hardly worth while to dwell more on one than on the other. Yet I think that as a people we need more to learn the lesson of Valley Forge even than that of Gettysburg. I have not the slightest anxiety but that this people, if the need should come in the future, will be able to show the heroism, the supreme effort that was shown at Gettysburg, tho it may well be that it would mean a similar two years of effort, checkered by disaster, to lead up to it. But the vital thing for this nation to do is steadily to cultivate the quality which Washington and those under him so pre-eminently showed during the winter at Valley Forge—the quality of steady adherence to duty in the teeth of difficulty, in the teeth of discouragement, and even disaster; the quality that makes a man do what is straight and decent, not one day when a great crisis comes, but every day, day in and day out, until success comes at the end.

Of course, all of us are agreed that a prime national need is the need of commemorating the memories of the men who did greatly, thought highly, who fought, suffered, endured, for the nation.

It is a great thing to commemorate their lives; but, after all, the worthy way to do so is to try to show by our lives that we have profited by them. If we show that the lives of the great men of the past have been to us incitements to do well in the present, then we have paid performance of the every-day duties of life, not with hope of reward, but because they are duties.

I spoke of how we felt that we had in Washington and Lincoln national ideals. I contrasted their names with the names of many others in history,

THEODORE ROOSEVELT.

to them the only homage which is really worthy of them. If we treat their great deeds as matters merely for idle boasting, not as spurring us on to effort, but as excusing us from effort, then we show that we are not worthy of our sires, of the people who went before us in the history of our land. What we as a people need more than aught else is the steady

names which will shine as brightly, but oh, with how much less power and light. I think you will find that the fundamental difference between our two great national heroes and almost any other men of equal note in the world's history, is that when you think of our two men you think inevitably not of glory, but of duty; not of what the man

did for himself in achieving name or fame or position, but of what he did for his fellows. They set the right ideal and also they lived up to it in practical fashion. Had either of them possessed that fantastic quality of mind which sets an impossible and, perhaps, an undesirable ideal, or which declines to do the actual work of the present because forsooth the implements with which it is necessary to work are not to that man's choice, his fame would have been missed, his achievement would have crumbled into dust, and he would not have left one stroke on the book which tells of effort accomplished for the good of mankind.

A man, to amount to anything, must be practical. He must actually do things, not talk about doing them, least of all cavil at how they are accomplished by those who actually go down into the arena, and actually face the dust and the blood and the sweat, who actually triumphed in the struggle. The man must have the force, the power, the will to accomplish results, but he must have also the lift toward lofty things which shall make him incapable of striving for aught unless that for which he strives is something honorable and high—something well worth striving for.

I congratulate you that it is your good fortune to be engaged in erecting a memorial to the great man who was equal to the great days—to the man and the men who showed by their lives that they were indeed doers of the Word and not hearers only.

The Song of Freedom

BY WILLIAM HAYES WARD

Flag of Freedom, glory-starred,
Land of Freedom, fair and wide,
Freedom's God shall be thy guard
Long as stars in heaven abide!
Shout the word across the sea!
Jubilate! Liberty!

Patriot sires to us have given
Freedom's rights in battle won;
Every tyrant fetter riven,
Blessed land of Washington!
Shout the word across the sea!
Jubilate! Liberty!

Fathers, guard it for your sons;
Mothers, pray on bended knee,
Teach it to your little ones,
"God preserve us pure and free!"
Shout the word across the sea!
Jubilate! Liberty!

Nations of the elder world,
Learn the lesson we would teach,
Flag for all mankind unfurled,
Equal rights for all and each.
Shout the word across the sea!
Jubilate! Liberty!

Rulers rule by free consent,
Every man of royal birth;
Thus the people's government
Shall not fail from off the earth.
Shout the word across the sea!
Jubilate! Liberty!

Of the people, government,
By the people, equal rule,
For the peop'e, President,
Congress, courts and public school—
Shout the word across the sea!
Jubilate! Liberty!

God and Father of the free,
Hear the prayer the nation saith,
Prayer our fathers offered thee,
"Give us liberty or death!"
Sound the word across the sea!
Jubilate! Liberty!

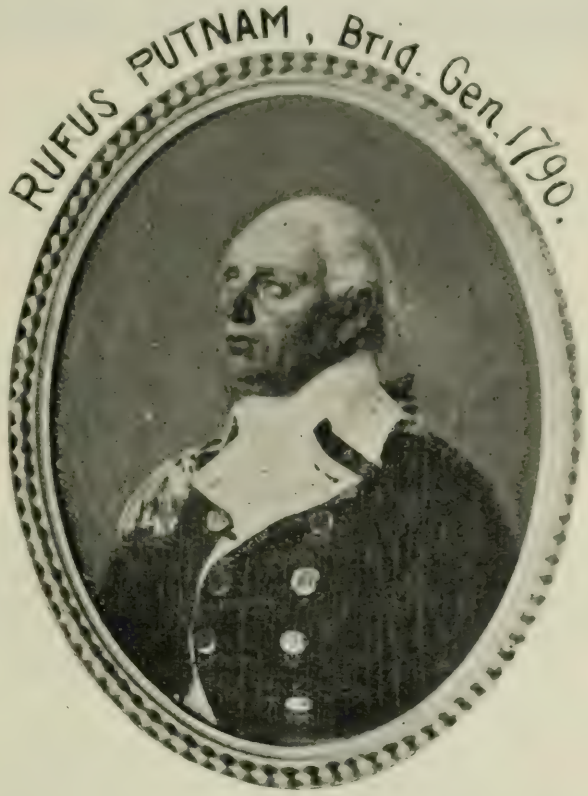
At Sea, June 16, 1904.

Rufus Putnam

BY GEORGE F. HOAR

United States Senator from Massachusetts and Ex-President of the American Historical Association

UNHAPPILY there have been many cases in history, when the hidden record "leaps to light," that some lofty character is shamed. Rarely, but once in a while, the record brings to light the greatness of some man of a bygone generation, that his contemporaries had not known. Commonly this has happened when the impartial criticism of a later time has seen clearly, as in the case of Cromwell and Henry VIII, striking qualities to which the hatreds encountered in their lifetime made mankind blind.



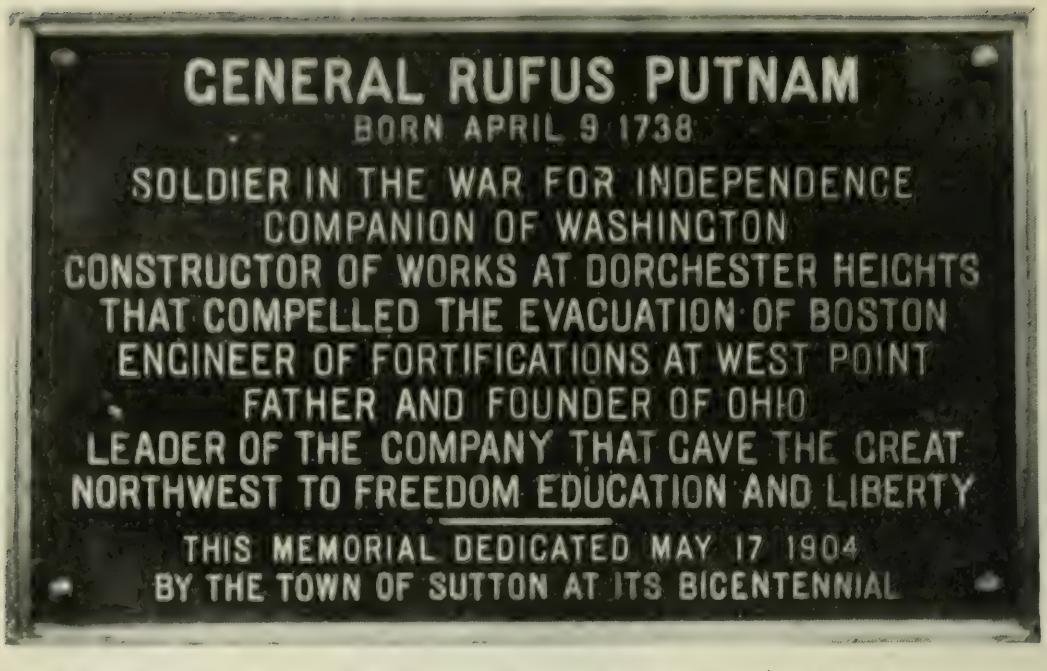
But in the case of Rufus Putnam the record shows a noble public service, of which the men of his own time knew little, of the extent of which he was himself hardly aware, and to which his simple modesty kept him from making public claim. He was treated fairly by the men of his own generation. He had the confidence and friendship of Washington. He was recognized by the people of a great State as its founder and leader. He was a brave and efficient officer, and an excellent citizen. He died in an honored old age. But until within the last fifteen years, he would have been mentioned only as a military officer of the third rank; of course, not in the rank where Washington stands alone, and not reckoned as the equal of Greene or Israel Putnam or Lincoln or Schuyler. Bancroft alludes to him but twice. In one place he says, speaking of Dorchester Heights:

"The engineer employed to devise and superintend the works was Rufus Putnam."

In the other, speaking of the evacuation of New York in September, 1776, he says:

"Rufus Putnam, his ablest engineer, reported that the enemy could land where they pleased."

That is all that history would have had to say of Rufus Putnam, but for a letter of Timothy Pickering; a few entries in Putnam's own diary; a few in the diary of Manasseh Cutler; three or four letters to and from Washington; a note in Dane's Abridgment; a letter from Dane to Rufus King, and the original Ordinance of 1787, now among the Peter Force papers in the Library of Congress at Washington.



The Pickering letter was first made public in 1867. It is dated at New Windsor, April 7th, 1783, and is addressed to Hodgdon.

Cutler's diary was printed in 1888.

The full effect of the Ordinance of 1787, as it was amended on the floor, on motion of Nathan Dane, who originally reported it, can only be understood by an inspection of the document, for the first time made possible, except by visiting the Library, where the original is kept, by the accompanying reproductions.

In such a case, when we make such a claim for him, after a century and a quarter has gone by, we must look carefully to our proof.

Inscription on Putnam Memorial Tablet, Recently Dedicated at Sutton.

Rufus Putnam is entitled to the credit of four great achievements:

1. The exclusion of slavery from the Northwest Territory;

2. The engineering that drove the British Army from Boston;

3. The fortification of West Point, which kept open the communication between New England and the South during the Revolutionary War, without which the American cause would have been lost; and,

4. The saving of Washington's Army near White Plains when defeat would have been fatal.

Each of these things was a matter of the first importance, which turned the currents of history. Each was a turning point in the fate, not only of America, but of Constitutional Liberty itself.

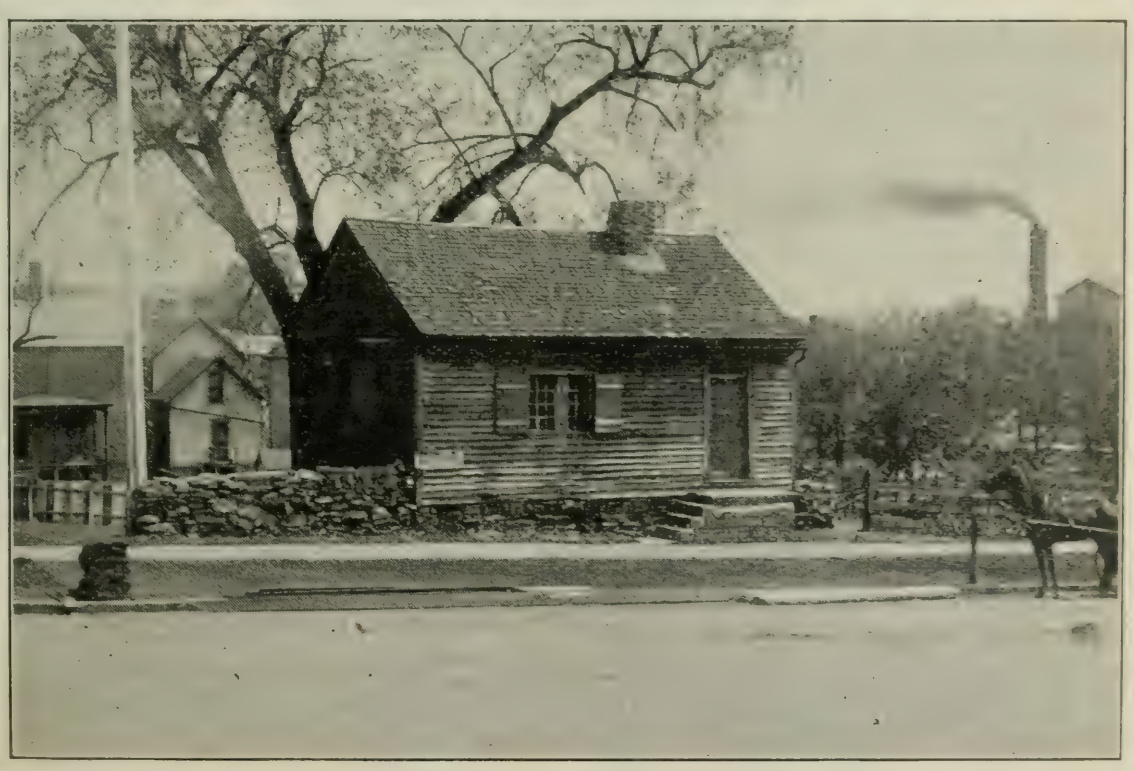
It seems to me the proof is clear in every case as to every matter but one. As to that, he has made the claim for himself, and the fact that he was not a man who made claims for himself warrants us in trusting him for that one, even if he be not supported by other testimony.

In 1888 the five States of the Northwestern Territory united to celebrate the centennial of its foundation, and they did me the honor of asking me to deliver the address on that occasion. I spent more than six months of solid study of the history of that mighty event, hoping that if what I should say on that occasion should be preserved at the end of another century, I might not have said anything that would not stand the criticism of posterity.

The result of my study was a brief address of a few pages, and the leaving out of what would have made a volume of much length. I take more credit for what I did not say on that occasion than for what I said.

I have no doubt of the absolute and unquestioned truth of the historic conclusions to which I came. The more I study that noble history, the more I see that the pervading genius and soul of the Ohio settlement was Rufus Putnam.

There are men who stand at the parting of the ways and who divert for all time the currents of history. I say that it was given by God to him to do that on four important occasions pregnant with the fate of liberty and of the country.



The first was the expulsion of the British Army from the soil of Massachusetts. General Washington, with a few cannon, dragged by oxen across the country from Ticonderoga, and with ammunition hardly enough to fire a salute, with an audacity that would have made him an expert in some modern games of chance, had kept the British Army, superior in force to his, within its entrenchments in Boston.

Congress was scolding and reproaching him for his inactivity. Washington had 13,000 men intrenched in Boston.

Sir William Howe had 11,000 of the flower of the British Army, veterans, most of them, of many a hard fought Continental field. They had, too, a powerful fleet commanding the mouth of Charles River and all the wide approaches along the coast.

One night Rufus Putnam was summoned to a council of war in Cambridge. Three weeks before, with the training of a country millwright, he had been appointed, contrary to his earnest remonstrance, Engineer of the American Army. Washington told his officers that they must make an attack on Boston over the ice, attacking the British General in his intrenchments, or his army must be disbanded and go home, and the cause of the Revolution must be abandoned. It was then proposed to erect fortifications on Dorchester Heights, which commanded the city. The frost was two feet deep in the ground. Yet that was the alternative to marching over the ice to attack the British forces intrenched in the town, and protected by the fleet.

Putnam walked back to his tent in Roxbury. By the way he saw a light in the headquarters of General Heath. He said to his companion, "Let us go in and call on the General." He found on Heath's table a book, just published, entitled "Muller's Military Engineering." He looked at it casually, and asked Heath to lend it to him. Heath replied that he never lent his books. Putnam asked again, and was refused. Putnam then said to him: "You are one of the men who a few weeks ago compelled me to take a position for which I declared myself unfit. Now, the first chance I have to learn anything about it, you won't lend me the book which may help me." Heath gave way. Putnam took it home. Before he went to bed he glanced at the index. The word chandelier caught his eye, a word he had never seen in that connection before. He looked at the text and found the chandelier consisted of a frame of logs 20 or 30 feet long, of four timbers, like an old-fashioned bedstead, mortised together, the space within filled with faggots, to make a breastwork. In two minutes he had his scheme for fortifying Dorchester Heights. He set to work the next day and ordered his men to cut the logs and bring the faggots. When the British General went to bed on the night of March 4th, 1776, Dorchester Heights seemed to him just as

Ohio Company's Land Office. This was built in 1788, and in it Rufus Putnam transacted the affairs of the Ohio Company.

nature and the husbandmen had left them for the last century. When he rubbed his eyes in the morning, Sir William Howe saw the fortifications, of which he said that they seemed as if they had been the work of 30,000 for three months. Edmund Burke said that they seemed to revive the old stories of Arabian enchantment. Putnam also, by Washington's express orders, got some barrels and filled them with stones to roll down on the British if they attacked them.

Howe was a man of spirit. He ordered an instant attack. Earl Percy was to lead it. But there came a storm like that which dispersed the Armada, and in the three or four days the fortifications were completed and impregnable. The English Army evacuated Boston, bag and baggage, horse, foot and dragoons. The Americans, under Israel Putnam, marched in with drums beating and colors flying. Imperialism sailed down the harbor, and American Liberty took its place.

RUFUS PUTNAM,
Founder of the first permanent settlement in the Northwest Territory

Now, suppose the British had held Boston until their reinforcements came. Suppose the men of Massachusetts, who furnished more troops for the Revolutionary War than all the Southern States together, had been kept at home, with Boston in the power of the British Army, what would have become of our Revolution?

Is it not true that this man by his action diverted the current of history, and that that little flash of his genius at midnight was a historic epoch in the annals of mankind?

Again, when Washington's Army was hard pressed at White Plains, the single greatest peril of our Revolutionary War, Rufus Putnam, at the greatest personal hazard, penetrated the plans of the British General and saved the army. His modest statement of this transaction, which he attributes to a special interposition of Providence, will be found in his "Memoirs," page 63.

Washington said that Rufus Putnam was the best engineer officer in our service, whether French or American. It was he who fortified West Point, thereby keeping open the communication between New England and the South. If that communication had been interrupted the Revolution must have failed. Fort Putnam still remains at West Point, as his enduring monument. When the war ended Washington directed him to prepare a scheme of fortifications for the entire frontier of the country. This was done by Putnam. The plans drawn by him are now in the Library of Marietta College.

But his greatest achievement remains to be told. To him, under God, it is owing that the great Northwest was dedicated forever to Freedom, Education and Liberty.

In 1783 Timothy Pickering wrote a letter to Mr. Hodgdon, the delegate in the Continental Congress from Essex County, in which he said there was a plan among the officers of the Revolutionary War in the possession of General Putnam and General Huntington, to settle the Ohio Territory with a company of veteran soldiers. Pickering adds that it is the inexorable condition of that plan that there shall be neither slavery nor involuntary servitude in the said territory, otherwise than in the punishment of crime, whereof the party shall have been duly convicted.

Huntington is never heard from in the matter again. For the next four years Putnam is repeatedly urging his plan

upon Washington. Washington replies, expressing his hearty interest and approval, but declares he can do nothing with Congress.

There was an attempt in Congress to pass an Ordinance for the organization of the Territory, with a provision drawn by Jefferson for the exclusion of slavery after 1800. If that had been enacted, subsequent events prove beyond question that slavery would have got a footing there and never could have been dislodged.

But even that mild enactment found little favor in Congress, either North or South. The clause prohibiting slavery was stricken out. The Ordinance was reported later without it. But it died in the Congress of 1786.

In 1787 Putnam was ready to move. In the meantime he had issued from his house in Rutland a call for a convention of veteran soldiers to settle the Ohio Territory. The convention met, chose him, General Parsons and Manasseh Cutler to obtain a grant from Congress. Parsons repaired to New York for that purpose. But he made no impression on Congress, and his plans, for some reason not now apparent, were disapproved by Putnam and Cutler.

Then Cutler was dispatched. He was the most competent man on the continent, unless we except Franklin, for such a mission. He met Putnam in Boston and settled with him the principles upon which he should obtain the cession of the Western lands.

When he came to New York he found, as has been stated, that the old Ordinance had died in the previous Congress. But he commanded the situation. He was ready to pay a large sum of money into the sorely embarrassed public treasury. He was ready to exchange the claims of half-pay of the men whom he represented for a payment in land. More important still, this settlement would hasten the tardy evacuation of the British in the Northwestern Territory. It would interpose a shield of veteran soldiers between the defenseless settlers of West Virginia, Western Pennsylvania and New York and the most powerful and war-like tribe of Indians on the continent.

Even more important still, this settlement would determine in favor of the United States the wavering allegiance of the Northwest, many of whose people were inclined to a union with Spain in the control of the mouth of the Mississippi.

On October 10th, 1784, General Washington says in a letter to Governor Harrison, of Virginia:

"The Western States (I speak now from my own observation) stand, as it were, upon a pivot. The touch of a feather would turn them any way."

In a letter in 1790 Fisher Ames asked Rufus Putnam:

"Can we retain the Western country within the Government of the United States, and, if we can, of what use will it be to them?"

Congress brought forward from the files of the last session the defunct Ordinance, and assured Cutler that it would be passed at once. He, accordingly, thinking that his mission has succeeded, went on a journey to Philadelphia for a few days, where the Federal Convention was in session.

But the Ordinance was reported without the clause prohibiting slavery. Nathan Dane and his committee had left the part of Hamlet out of the play. He says in a letter to Rufus King, written just after, that he did not report that because he did not believe it could be passed.

But, as appears from the annexed reproduction, it was moved by Dane from the floor. The print in part shows the original Ordinance. The amendment is in the handwriting of Nathan Dane. Unquestionably this provision, an indispensable condition of the original scheme of 1783, was part of Cutler's instructions at Boston, and it was due to them that it was inserted, after it had been more than once defeated in Congress, and after Nathan Dane had despaired of its acceptance and had declined to report it, even in 1787.

If that territory had been settled from Virginia, as Kentucky was, or from Virginia and Kentucky, as Missouri was, and our Civil War had come on, 15,000,000 people, five great States, one million soldiers, would have been on the other side in the great conflict. We of the Northeast would have now been citizens of a little confederacy by the Atlantic, or

An Ordinance for the Government of the Territory of the United States, North-West of the River Ohio.

BE IT ORDAINED by the United States in Congress assembled, That the said territory, for the purposes of temporary government, be one district, subject, however, to be divided into two districts, as future circumstances may, in the opinion of Congress, make it expedient.

Be it ordained by the authority aforesaid, That the estates both of resident and non-resident proprietors in said territory, dying intestate, shall descend to, and be distributed among their children, and the descendants of a deceased child in equal parts; the descendants of a deceased child or grand-child to take the share of their deceased parent in equal parts among them: And where there shall be no children or descendants, then in equal parts to the next of kin, in equal degree; and among collaterals the children of a deceased brother or sister of the intestate, shall have in equal parts among them their deceased parents share; having in all cases to the widow of the intestate, her third part of the real estate for life, and ~~where there shall be no children or descendants~~, one third part of the personal estate; and this law relative to descents and dower, shall remain in full force until altered by the legislature of the district. And until the governor and judges shall adopt laws as hereinafter mentioned, estates in said territory may be devised or bequeathed by wills in writing, signed and sealed by him or her, he, whom the estate may be, (being of full age) and attested by three witnesses; ~~—~~and real estates may be conveyed by lease and release, or bargain and sale, signed, sealed, and delivered by the person being of full age, in whom the estate may be, and attested by two witnesses, provided such wills be duly proved, and such conveyances be acknowledged, or the execution thereof duly proved, and be recorded within one year after proper magistrates, courts, and registers shall be appointed for that purpose; and personal property may be transferred by delivery, saving, however, ~~to the inhabitants of Kaskaskies, and St. Vincents and the neighboring villages who have heretofore professed themselves citizens of Virginia~~, their laws and customs now in force among them, relative to the descent and conveyance of property.

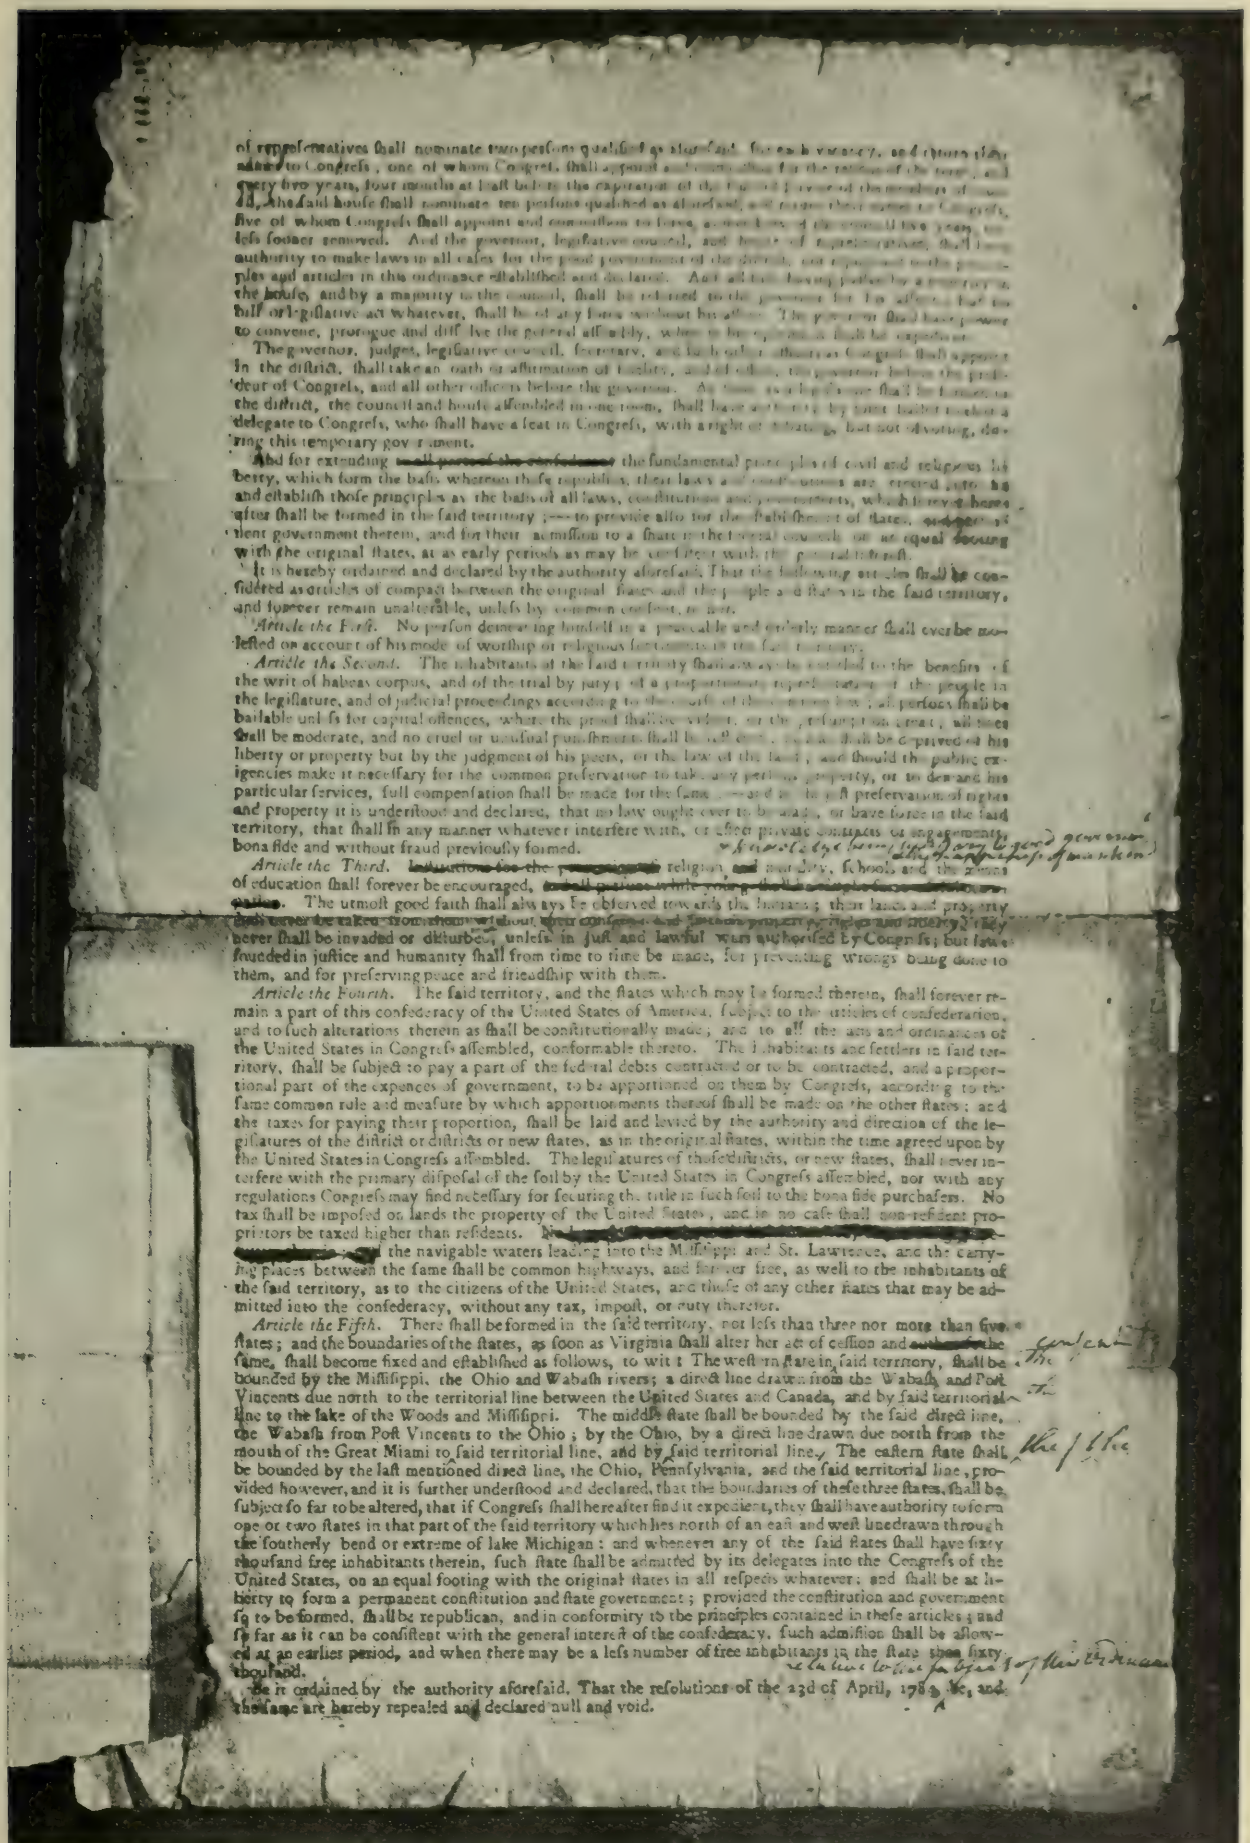
Be it ordained by the authority aforesaid, That there shall be appointed from time to time, by Congress, a governor, whose commission shall continue in force for the term of three years, unless sooner revoked by Congress; he shall reside in the district, and have a freehold estate therein, in one thousand acres of land, while in the exercise of his office.

There shall be appointed from time to time, by Congress, a secretary, whose commission shall continue in force for four years, unless sooner revoked, he shall reside in the district, and have a freehold estate therein, in five hundred acres of land, while in the exercise of his office; it shall be his duty to keep and preserve the acts and laws passed by the legislature, and the public records of the district, and the proceedings of the governor in his executive department; and transmit authentic copies of such acts and proceedings, every six months, to the secretary of Congress: There shall also be appointed a court to consist of three judges, any two of whom to form a court, who shall have a common law jurisdiction, and reside in the district, and have each therein a freehold estate in five hundred acres of land, while in the exercise of their offices; and their commissions shall continue in force during good behaviour.

The governor and judges, or a majority of them, shall adopt and publish in the district, such laws of the original states, criminal and civil, as may be necessary, and best suited to the circumstances of the district, and report them to Congress, from time to time, which laws shall be in force in the district until the organization of the general assembly therein, unless disapproved of by Congress; but afterwards the legislature shall have authority to alter them as they shall think fit.

The governor for the time being, shall be commander in chief of the militia, appoint and commission all officers in the same, below the rank of general officers; all officers ~~above that rank~~ shall be appointed and commissioned by Congress.

Previous to the organization of the general assembly the governor shall appoint such magistrates and other civil officers, in each county or township, as he shall find necessary for the preservation of the peace and good order in the same: After the general assembly shall be organized, the powers and duties of magistrates and other civil officers shall be regulated and defined by the said assembly; but all magistrates and other civil officers, not herein otherwise directed, shall, during the continuance of this temporary government, be appointed by the governor.



For the prevention of crimes and injuries, the laws to be adopted or made shall have force in all parts of the district, and for the execution of process, criminal and civil, the governor shall make proper divisions thereof—and he shall proceed from time to time, as circumstances may require, to lay out the parts of the district in which the Indian titles shall have been extinguished, into counties and townships, subject, however, to such alterations as may thereafter be made by the legislature.

So soon as there shall be 5000 free male inhabitants, of full age, in the district, upon giving proof thereof to the governor, they shall receive authority, with time and place, to elect representatives from their counties or townships, to represent them in the general assembly; provided that for every 500 free male inhabitants there shall be one representative, and so on progressively with the number of free male inhabitants, shall the right of representation increase, until the number of representatives shall amount to 25, after which the number and proportion of representatives shall be regulated by the legislature; provided that no person be eligible or qualified to act as a representative, unless he shall have been a citizen of one of the United States three years and be a resident in the district, or unless he shall have resided in the district three years, and in either case shall likewise hold in his own right, in fee simple, 200 acres of land within the same:—Provided also, that a freehold in fifty acres of land in the district, having been a citizen of one of the states, and being resident in the district; or the like freehold and two years residence in the district shall be necessary to qualify a man as an elector of a representative.

The representatives thus elected, shall serve for the term of two years, and in case of the death of a representative, or removal from office, the governor shall issue a writ to the county or township for which he was a member, to elect another in his stead, to serve for the residue of the term.

The general assembly, or legislature, shall consist of the governor, legislative council, and a house of representatives. The legislative council, shall consist of five members, to continue in office five years, unless sooner removed by Congress, any three of whom to be a quorum, and the members of the council shall be nominated and appointed in the following manner, to wit: As soon as representatives shall be elected, the governor shall appoint a time and place for them to meet together, and when met, they shall nominate ten persons residents in the district, and each possessed of a freehold in 500 acres of land, and return their names to Congress; five of whom Congress shall appoint and commission to serve as aforesaid; and whenever a vacancy shall happen in the council, by death, or removal from office, the house

Reduced *fac-simile* of Government Ordinance Relating to Territory Northwest of the Ohio River (Page 1)

of representatives shall nominate two persons qualified as aforesaid, for each vacancy, and return their names to Congress, one of whom Congress shall appoint and commission for the residue of the term; and every two years, four months at least before the expiration of the time of service of the members of the council, the said house shall nominate ten persons qualified as aforesaid, and return their names to Congress, five of whom Congress shall appoint and commission to serve as members of the council five years, unless sooner removed. And the governor, legislative council, and house of representatives, shall have authority to make laws in all cases for the good government of the district, not repugnant to the principles and articles in this ordinance established and declared. And all bills having passed by a majority in the house, and by a majority in the council, shall be referred to the governor for his assent; but no bill or legislative act whatever, shall be of any force without his assent. The governor shall have power to convene, prorogue and dissolve the general assembly, when in his opinion it shall be expedient.

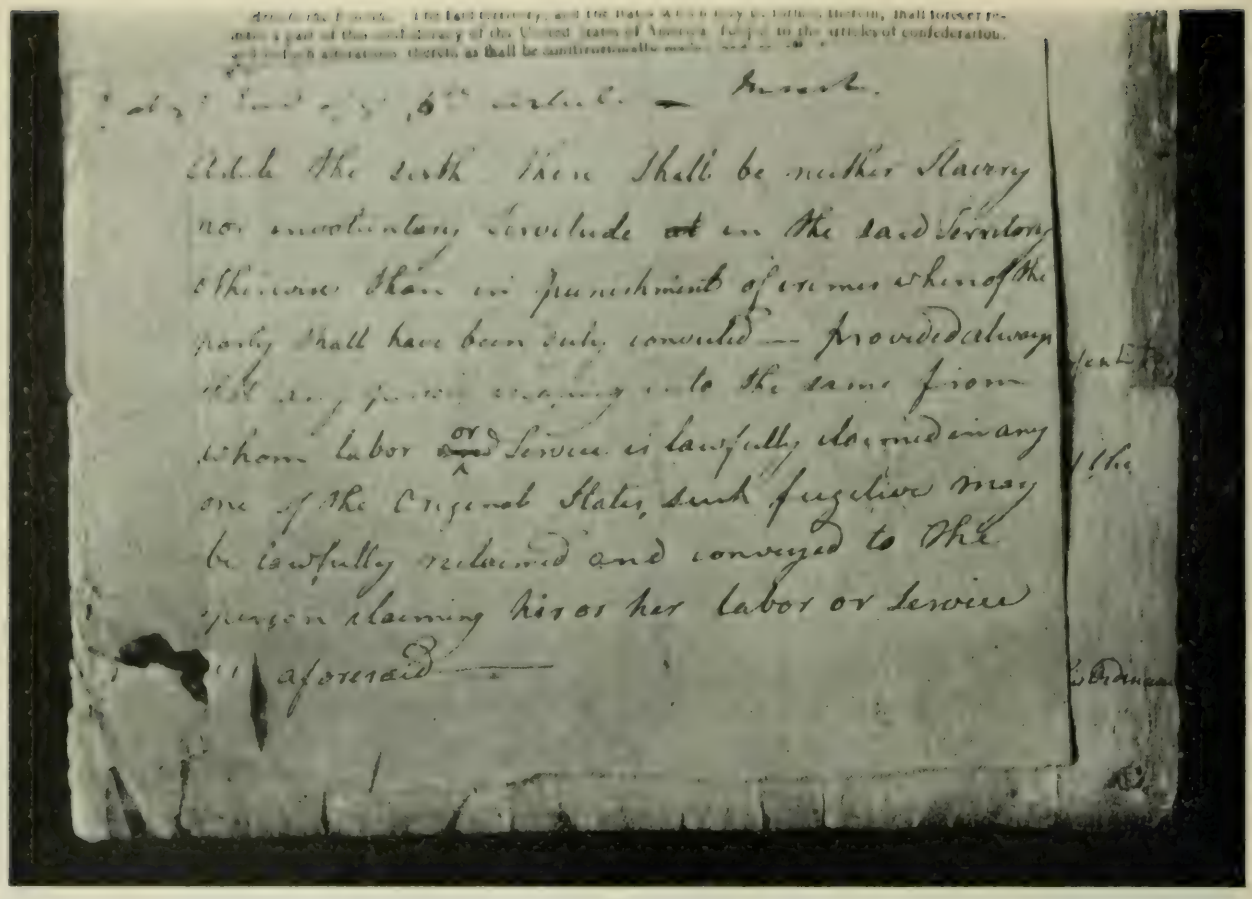
The governor, judges, legislative council, secretary, and such other officers as Congress shall appoint in the district, shall take an oath or affirmation of fidelity, and of office, the governor before the president of Congress, and all other officers before the governor. As soon as laws shall be in force in the district, the council and house assembled in one room, shall have authority by joint ballot to appoint a delegate to Congress, who shall have a seat in Congress, with a right of debating, but not voting, during this temporary government.

And for extending the fundamental principles of civil and religious liberty, which form the basis whereon these republics, their laws and constitutions are erected; to fix and establish those principles as the basis of all laws, constitutions and governments, which forever hereafter shall be formed in the said territory;—to provide also for the establishment of states, and permanent government therein, and for their admission to a share in the federal councils on an equal footing with the original states, at as early periods as may be consistent with the general interest.

It is hereby ordained and declared by the authority aforesaid, That the following articles shall be considered as articles of compact between the original states and the people and states in the said territory, and forever remain unalterable, unless by common consent, to wit:

Article the First. No person demeaning himself in a peaceable and orderly manner shall ever be molested on account of his mode of worship or religious sentiments in the said territory.

Article the Second. The inhabitants of the said territory shall always be entitled to the benefits of the writ of habeas corpus, and of the trial by jurys of a proportionate representation of the people in the legislature, and of judicial proceedings according to the course of the common law; all persons shall be bailable unless for capital offences, where the proof shall be evident, or the presumption great, all fines shall be moderate, and no cruel or unusual punishments shall be inflicted. No man shall be deprived of his liberty or property but by the judgment of his peers, or the law of the land, and should the public exigencies make it necessary for the common preservation to take any person's property, or to demand his particular services, full compensation shall be made for the same. And in the just preservation of rights and property it is understood and declared, that no law ought ever to be made, or have force in the said territory, that shall in any manner whatever interfere with, or affect private contracts or engagements, bona fide and without fraud previously formed.



Article the Third. Religion, morality, schools, and the means of education shall forever be encouraged. No person shall ever be molested on account of his mode of worship or religious sentiments, while they shall continue to conduct themselves peaceably. The utmost good faith shall always be observed towards the Indians; their lands and property shall never be taken from them without their consent; and in their property, rights and liberty they shall never be invaded or disturbed, unless in just and lawful wars authorized by Congress; but laws founded in justice and humanity shall from time to time be made, for preventing wrongs being done to them, and for preserving peace and friendship with them.

Article the Fourth. The said territory, and the states which may be formed therein, shall forever remain a part of this confederacy of the United States of America, subject to the articles of confederation, and to such alterations therein as shall be constitutionally made; and to all the acts and ordinances of the United States in Congress assembled, conformable thereto. The inhabitants and settlers in said territory, shall be subject to pay a part of the federal debts contracted or to be contracted, and a proportional part of the expences of government, to be apportioned on them by Congress, according to the same common rule and measure by which apportionments thereof shall be made on the other states; and the taxes for paying their proportion, shall be laid and levied by the authority and direction of the legislatures of the district or districts or new states, as in the original states, within the time agreed upon by the United States in Congress assembled. The legislatures of those districts, or new states, shall never interfere with the primary disposal of the soil by the United States in Congress assembled, nor with any regulations Congress may find necessary for securing the title in such soil to the bona fide purchasers. No tax shall be imposed on lands the property of the United States, and in no case shall non-resident proprietors be taxed higher than residents. [redacted] the navigable waters leading into the Mississippi and St. Lawrence, and the carrying places between the same shall be common highways, and forever free, as well to the inhabitants of the said territory, as to the citizens of the United States, and those of any other states that may be admitted into the confederacy, without any tax, impost, or duty therefor.

Article the Fifth. There shall be formed in the said territory, not less than three nor more than five states; and the boundaries of the states, as soon as Virginia shall alter her act of cession and consent to the same, shall become fixed and established as follows, to wit: The western state in said territory, shall be bounded by the Mississippi, the Ohio and Wabash rivers; a direct line drawn from the Wabash and Post Vincents due north to the territorial line between the United States and Canada, and by said territorial line to the lake of the Woods and Mississippi. The middle state shall be bounded by the said direct line, the Wabash from Post Vincents to the Ohio; by the Ohio, by a direct line drawn due north from the mouth of the Great Miami to said territorial line, and by said territorial line. The eastern state shall be bounded by the last mentioned direct line, the Ohio, Pennsylvania, and the said territorial line: provided however, and it is further understood and declared, that the boundaries of these three states, shall be subject so far to be altered, that if Congress shall hereafter find it expedient, they shall have authority to form one or two states in that part of the said territory which lies north of an east and west line drawn through the southerly bend or extreme of lake Michigan: and whenever any of the said states shall have sixty thousand free inhabitants therein, such state shall be admitted by its delegates into the Congress of the United States, on an equal footing with the original states in all respects whatever; and shall be at liberty to form a permanent constitution and state government; provided the constitution and government so to be formed, shall be republican, and in conformity to the principles contained in these articles; and so far as it can be consistent with the general interest of the confederacy, such admission shall be allowed at an earlier period, and when there may be a less number of free inhabitants in the state than sixty thousand.

Be it ordained by the authority aforesaid, That the resolutions of the 23d of April, 1784, &c. and the same are hereby repealed and declared null and void.

Reduced *fac-simile* of Government Ordinance Relating to Territory Northwest of the Ohio River (Page II)

The Dane Amendment to Government Ordinance Relating to Territory Northwest of the Ohio River

would now have been citizens of a great slave-holding confederacy.

This Ohio Territory got many emigrants, as it was, from the Southern States. They tried to establish slavery. The Ohio convention met in 1802. Rufus Putnam was a member of it, and a son of Manasseh Cutler, a former ally of Putnam in his work for the freedom of Ohio, was in bed at his hotel. Rufus Putnam took him out of bed at midnight, saying, "You must get up at the risk of your life and come with me, for they are going to establish slavery in Ohio." The two men went to the convention, and slavery was beaten by one vote.

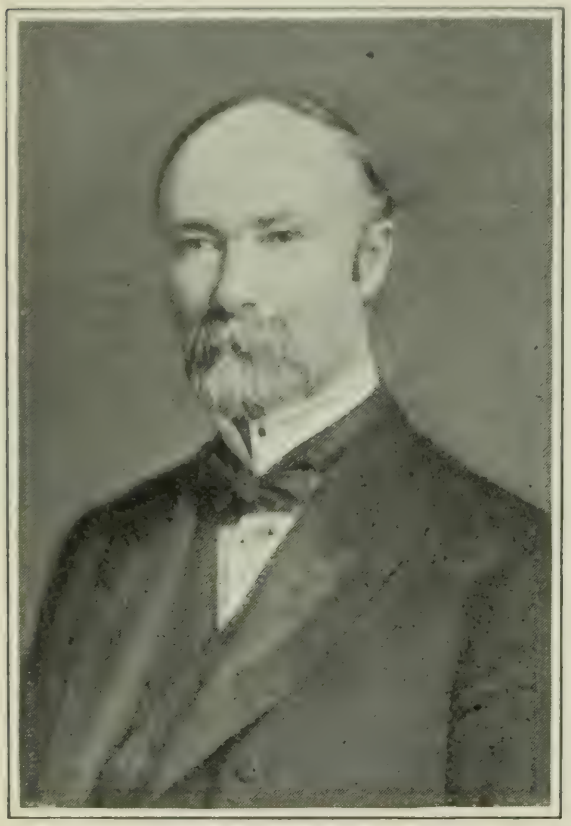
This country has contributed many great men to human history. But if most of them had never lived, there would have been plenty of others to take their places. Massachusetts and New York and Pennsylvania would hardly have missed most of the men whose statues are found in their public squares, and whose portraits are in their picture galleries, if they had never been born. They were the representatives and leaders of the prevailing opinion and character of the nation. But there would have been other representatives and leaders in plenty. That is true of the day when our political independence was won. It has been true of the later days when our literary and intellectual independence has been won, and when our manufacturing and commercial independence has been achieved. But there has been but one Washington, but one Franklin, but one Marshall, but one Emerson.

I do not claim for Rufus Putnam that his was one of the great intellects of the world. But I venture to think that he has a right to rank with these four men by reason of the fact that but for what he did the cause of Independence and of Liberty would have been lost, on at least four great occasions. But for him, the majestic stream would have turned in another direction, would have worked out for itself another channel, and would have emptied into another sea.

WORCESTER, MASS.

Charles Warren Fairbanks

BY FRANCIS E. LUEPP



Author of "The Man Roosevelt"

THE nomination of Charles W. Fairbanks as Vice-Presidential candidate on the Republican ticket was really the nomination of the State of Indiana. In other words, Mr. Fairbanks's control of the politics of his State is such as no other leader since Oliver P. Morton has exerted. Next to Senator Hanna he probably would be accorded first place in the list of recent American politicians for his ability as an organizer. The methods of the two men differ so essentially, however, that no fair comparison could be made between them by any system of parallels. Hanna was of the commanding type. He was positive, obviously alert at all times, aggressive in spite of his genial manner, direct in his statements and unchanging of purpose. Fairbanks is a still hunter. He makes no enemies except through exasperation with his refusal to lose his temper. He never provokes a battle and never apparently encourages his adversary to come on. Whoever descends upon him with hostile design finds him soft-voiced and gentle, unruffled outwardly, beaming all around, perhaps just a trifle shy. But disposed to retreat or surrender? Oh, dear, no! While the intending assailant is rampaging about, and brandishing his arms, and making faces and uttering threats of slaughter, Fairbanks is quietly spreading his net. Woe to the fatuous soul who charges down upon him with the notion that so bland and smiling a gentleman is harmless, for he will have a chance to repent his folly in captivity.

Senator Voorhees was known in the Senate and its purlieus as the Tall Sycamore of the Wabash. The title would apply with far more appropriateness to Fairbanks, who succeeded him in 1897. Fairbanks is so tall and slender that with his large head he has to stoop very slightly to keep a proper poise in walking, as well as to bring his ear and his lips somewhere near the level of the ordinary man with whom he holds oral converse. Voorhees was, in the Senate as well as out, the jury lawyer; Fairbanks puts no fiery rhetoric into his speeches, but argues with his audience as with a court. If he regards a controversy as worth carrying on he will not shirk it, and will put the best view of his side to the front; but he will do this in such a way as to convey no possible personal affront, and as if he assumed on general principles that his adversary really agreed with him, tho compelled by adventitious conditions to take the opposite ground. There is hardly a public speaker in the country who can take it for granted that there is no other side to a proposition than his own, and yet treat with such respect the perfunctory suggestions from the misguided or uninformed gentleman who essays to make a case against him. His manner breathes the spirit of the patient teacher wrestling with the pupil who is putting foolish questions only for mischief, while the other boys and girls are looking on to see who is coming off the better in the encounter.

Mr. Fairbanks was born on a farm, and his boyhood was spent in the fields and forest. But, like many other successful men of modern times, he had to pick up a little money at newspaper work while preparing himself for his professional career at the bar. While a student at Wesleyan University he met a young woman who afterward became his wife, and who, besides bringing to him of her own volition a willing heart and ready hand of help, by accident threw into his way the opportunity of a lifetime, which he was quick to seize. They had settled down in Indianapolis. Her father was connected with the Terre Haute & Evansville Railroad, which failed, and the young lawyer was called in to straighten out some of its affairs. With that genius for hard work which has stood him in good stead in many later emergencies, he plunged into his task as if it contained a million-dollar fee. It

did not of itself; but that one case was handled so cleanly and completely that no railroad enterprise of any account has been undertaken in Indiana since then without his having a share in it. Ready insight into the possibilities of development of a piece of property and a prudent husbanding and reclassification of

CHARLES WARREN FAIRBANKS

Copyrighted, 1904, by Pach Bros.

its resources have been the main keys to his success as a railroad lawyer. They have also enabled him to put his money into the best ventures while they were still hanging apparently in the balance, and to grow rich along with the other first security-holders. He has also been very happy in his real estate investments.

The late President McKinley was a great admirer of Senator Fairbanks. They belonged in one sense to the same school of politicians, in preferring to treat every adversary as a possible friend. McKinley, however, had a gift for saying simple things in a most impressive manner; Fairbanks would be noted rather for saying impressive things in a conventional manner. This difference always did and always will put McKinley, in the popular esteem, among the wise and profound statesmen of his generation, whereas Fairbanks will never get full credit for what he really has said and done. Fairbanks is a man who wears well, however, and possibly with all his seeming reserve he is actually a very frank man when frankness strikes him as called for. This was illustrated when, in 1888, the Republican party in the State of Indiana was rent from top to bottom by the factional warfare between Harrison and Gresham. Fairbanks sided with Gresham, altho knowing that the latter had a minority for a following. Before going to the national convention that summer Fairbanks told Harrison candidly that he should support Gresham. Harrison, who was a suspicious man by

MRS. CHARLES WARREN FAIRBANKS

nature and very bitter in his animosity toward Gresham, was taken quite by surprise at this straightforward treatment, and expressed his gratification with unaffected cordiality.

He had reason later to feel even more kindly toward Fairbanks, who, at a point when the two factions were about to clash in the presence of the whole convention, with bad results for the party at large, went to Harrison's representative and arranged a *modus vivendi* under which, however much they might differ over local affairs, they should keep the

peace in the national arena instead of mutually encouraging the enemy. Both sides lived up to the compact like men. With a nice sense of his obligation as a leader to set a good example to his followers, he was the first prominent man in Indiana, after Harrison had been nominated, to offer his services on the stump. Stirred by this, the whole Gresham contingent turned in and gave their late foe a most generous support both during the campaign and at the polls.

There is a side to Mr. Fairbanks's nature which does not come to the light for exploitation very often, and then by accident—that is, his interest in struggling young men from his own section of country. He has been the means of setting more than one ambitious and promising young fellow upon his feet, and, of course, they are his debtors for life. In these beneficences he exercises the same caution as in his own political walk. Not everybody who applies to him for assistance gets it, by any means; but he shrewdly reserves what he has to do and give for those whom he believes capable of making effective use of it. Mrs. Fairbanks is said to be his trusted adviser in such matters as in others. She has the same taste for politics as her husband, but goes at the business in a more pronounced way.

I am not sure whether Mr. Fairbanks has ever made any special use of the coat-of-arms which belongs to him as a member of the group of American descendants of Jonathan Fairebanke, the English ancestor, who migrated in the seventeenth century and settled in Contentment—later christened Dedham—in the present Commonwealth of Massachusetts. In view of the fact that the Senator has been the architect of his own fortunes, and that he was nominated for Vice-President with a view to making him a candidate for President four years hence, he could afford to set up a new insignia of his own. It was one of his colleagues in the Senate who suggested that he should take a crane for a crest, since, "tho, like the crane, he may seem merely to meditate, when he shoots out his neck he usually gets a fish."

St. Louis, Mo.

The Bells of the Fourth of July

BY CLINTON SCOLLARD

What is it throbs adown the night
With golden falls and silvery swells?
From placid plain and slope and hight
It is the pæan of the bells;

It is the echo of the note
(Hearken the vibrant midnight chime!)
From one now memorable throat
In Revolutionary time.

"Freedom!"—the sound assailed the sky;
It filled, it thrilled the souls of men
On that old day of red July
Within the ancient home of Penn.

Then Might engirt our struggling sires;
Before it did they falter? nay!
For Right they lit their beacon-fires
On windy hill, by wide sea-bay.

And on through sanguinary years,
Spurred by the bell's exultant peal,
Freely they shed their blood and tears
To win and weld the Commonweal.

Not now, as then, do foes without
With ravin menace us and wrath;
Not now, as then, does ogre Doubt
Threat the fair promise of our path.

Sea-girt, embattled, and secure,
The rise and set of sun we face;
If we but hold our purpose pure,
Who shall surpass us in the race?

If we but heed the bells!—their tale
Of how our fathers made us free,—
Then shall no human power avail
To darken our high destiny!

Clinton, N. Y

"A Bachelor Maid" and Common Sense

BY MARION HARLAND

[We had our say last week in the editorial columns in reply to some of our "Bachelor Maid's" reasons for not marrying. Feeling that our masculine protests would not be considered final, we have asked Marion Harland to end the discussion, believing that she would do it as well as any woman we know of.—EDITOR.]

A HALF-TRUTH is a dangerous thing. When a conscientious reasoner, willing to weigh his opponent's con as fairly as he estimates his own pro, finds himself "up against" a battery of ingenious special pleadings founded upon half-truths, he is likely to lose his bearings for a moment and maybe his head. If the reasoner be a woman the chances are against her keeping temper and patience in the circumstances.

One of the few disadvantages of belonging to what Frances Power Cobb (herself a cogent debater — and a spinster) taught us to call "The Mother Sex," is that each of us adopts theory and belief as her very own—thought of her thought, heart of her heart.

This admission of a feminine foible is the preamble to a partial analysis of "A Bachelor Maid's" disquisition upon the causes that have held her back from entering the holy (?) estate of matrimony.

(The bracketed interrogation point is a courteous concession to our "able young" Professorin's "frank and unconventional confession" of doubt and opinion,—not a fling at churchly phraseology.)

Emulating her frankness, I acknowledge that judicial coolness forsook me at the first reading of a paper which simple-minded folk who have held over from a former generation will agree with me in pronouncing startling, to say the least. After a second perusal my shaken wits settled down upon their lees. A saving sense of humor should have a higher rank among Christian graces than is awarded to it by theologians. This second reading proved to me that "A Bachelor Maid" is of the Mother Sex. Her theory is her bantling, and runs away, sometimes, with sober reason.

It builds men of straw and challenges them to a bout of fisticuffs; it tempts her to tilt with windmills. Like a wise master builder, she loses no time in laying her corner stone. Like an architect of the (alleged) gentler sex, she comes back to it, once and again, tapping it with the trowel of illustration to test its stability.

Her basic proposition is

"the solid, elemental conviction of man that the rôle divinely appointed for woman to play in the Marriage Drama is that of the Fool."

The caucus of matrons of assorted ages in the drawing room scene, which is our curtain-raiser, likewise,

"with apparent unanimity delivered the verdict that the only way to be a truly happy married woman was to be a fool. That was what they said—in plain English. Whether they wished themselves to be classed among the fools or the unhappily married, considerations of delicacy forbade me to inquire."

That they were equally unanimous in the desire that our "Bachelor Maid," evidently a favorite with each of them, ought to marry, and were constantly maneuvering to effect this end, would have been proof positive to an unprejudiced, commonplace listener that the whole discussion was talk for talk's sake. Not one of the gossippers would have endured an adverse criticism of her husband from any other member of the coterie. It is as true that the most amiable and brainless would have resented hotly the imputation that she was a fool.

The prattle "A Bachelor Maid" dig-

nifies into a "contention" was lip-talk, such as, I blush to say, one hears every day among a certain class of women. It is a tongue-trick, in wretched taste, it is true, but not worthy of serious attention. Had our author's mother-wit been on guard she must have reached this decision by another route. These talkers were her friends and gentlewomen. Had they meant one-tenth of what they said in condemnation of marriage they would have beaten her back from the verge of the gulf instead of trying to push her over. Fools are not, of necessity, inhuman.

Ruling out, then, the evidence of senseless words, idly uttered, come we to conclusions drawn by our youthful pundit from association with divers admirers. Their numbers, if not their quality, testify to the "attractions" for which we have an editorial voucher.

One swain, indicated airily as "the last man I was engaged to," was so far left to himself and his evil genius as to remark

"under a peculiarly witching moon"—"Darling! whenever questions of judgment arise in our married life, MY WILL must be supreme."

"Darling" may not carry our sympathies with her in all stages of her contention. We are one with her in spirit when she turns her back upon the unglittering lure of marriage with a stupid despot. We almost forgive the vehement outbreak succeeding the tale of her disillusion:

"I lack that traditional instinct universally declared to be as essential a part of woman as any of her physical organs—the imperative need of a husband of such superior intelligence that he may be 'looked up to.' It is altogether heterodox, I know; but honestly, if one of us has got to be a fool, I should enjoy a great deal more complacency in feeling that my husband was that one."

We, her elders,—I do not say her superiors—having been witnesses at one time and another of the pitiable humiliation of wives whose husbands make fools of themselves, smile at the girl's ignorance, and let the hasty speech pass for what it is worth.

Matter for serious reflection attends upon her loverly experiences with men of finer grain and broader culture than the tasteless blunderer. Here she shall tell her own story:

"Certain of the same young men whose studies I had shared (assisted sometimes, dare I add?) have with fervor and tenderness held out to me the alluring prospect of broiling their beefsteak while they went on with the studies. And I suppose my whole disinclination to wed grows out of just this one thing: that I have been appalled by the hideous inequality of the condition which marriage offers to the man and to me, when we have come up to the wedding point essentially alike in our past training and our ideals for the future.

"The best of them have never, so far as I am aware, contemplated making me anything but their housekeeper."

In this connection we are introduced to another *fiancé*—whether the first, second, third, or next to the last, we are not told:

"'The trouble with you,' he sneered, in the quarrel which marked the close of our highly cyclonic betrothal, 'is that you know too much. I can never excuse you, if you are my wife, from the domestic and maternal duties that you were *made* for!' I had had quite a little experience previous to Harry, but never before in my life had the revolting consciousness been forced upon me as he forced it of what some men want a wife for. The married life of which I have permitted myself to dream contains a husband who may be willing—even proud—to give me encouragement and inspiration to develop in my chosen field of work as I, in turn, would offer appreciative sympathy to him in his; what my various lovers have desired in me is, as it appears, a mother for their children."

Harry's talk was plain enough in all conscience, from the standpoint of the average American woman. The deduction of the *ci-devant* and repeatedly-betrothed puts the case yet more baldly:

"From psychological and physical culture magazines I learn that men select their wives as they judge of stock at a fair, from the 'points' which indicate their suitability for breeding purposes. So for my offers of marriage I may thank my physical conformation! This enables us to give a true definition to that much abused word 'womanliness.' It is a quality to be attained by gymnastic exercises! I do not know how to express my feelings upon this point and make it printable. Pious platitudes upon the beauty of large families, the glory of motherhood, *et id genus omne*, are susceptible of refined, even poetical treatment, but the disgusting and unromantic conditions

to this supposedly beatific result, which every woman must face—we may speak of them guardedly to our physicians, but we do not discuss them in polite society."

After which eminently "printable" exposition of the views and motives of mankind in general and husbands in particular, we have illustrations galore of the bestial selfishness of men, and the consequent wrongs to wives of exquisite refinement and brilliant intellectual attainments, "imprisoned in nurseries, their mental activity hampered by endless domestic burdens and bodily pain"—adding to burden and pain by the yearly advent of unwelcome babies. We hear of a poor woman forty-two years old, whose insanity is sufficiently accounted for by the tale of nine children. Of another martyr to wifely obligations we read:

"Everybody knew why she lost her reason, and her husband knew it, too; but each time she was sent back from the asylum there was a new baby, until she had the good fortune to die in the birth of one."

"I am not prepared to say"—says our essayist in a fine burst of candor—"that I absolutely refuse to accept the charge of motherhood, but I *do* refuse—and I have no words to express the loathing with which I regard the idea—to be looked upon as a mere means of swelling the census report. Stripped of all its fine language, that is what all this prating of the beauty of large families amounts to. And yet I do not believe that there is, or ever has been, a large family which resulted from anything so high-minded as the deliberate desire of *both* parents to rear good citizens for the State. That some members of such families do turn out valuable citizens proves nothing more in their favor than the occasional fact that some woman, like Elizabeth Cady Stanton, may have the mental and physical strength to achieve something in spite of her numerous children."

One wife has kept her senses

"through twenty years of enforced surrender to a man who is her inferior save in the one all-important quality of brute force. Yet I wish that it were in my power to picture her face and voice as she has said to me:

"'Hel'? Do you think I can be afraid of it after the hell of my whole married life?'"

If I quote freely it is because I would do full justice to both sides of the question.

In my preamble I spoke of half-truths. The most obstinate opponent of race suicide cannot gainsay the modicum of truth there is in what "A Bachelor Maid" has set down. There *are* brutal husbands and patient, long suffering wives even in a country where there are more happy homes than in any other under God's heaven. In some households children are born yearly, and the excess of care thus imposed now and then drives a feeble woman out of her senses. Some homes are hells upon earth. I have been so unhappy as to learn this from the lips of no less than three men—all of them good men and true—each goaded to desperate word and deed by the woman he had taken for better and for worse. In one case the worst had succeeded worse in an ungovernable temper that spared neither neighbor, kinsman, husband nor child when the virago's blood was up, and it was seldom down. Another shrew joined the pleasant vice of the morphine habit to a bitter temper. A third was a helpless drunkard and a fool to boot.

Shall I, therefore, preach down married life as an inferno for all men? Dare I argue that women marry that they may be supported in their evil courses by husbands who cannot get out of the hell into which love and mistaken faith in feminine virtues and graces have plunged them?

"I'm not denyin' as women is fools," says Mrs. Poyser, the inimitable. "God A'mighty made 'em to match the men."

Reverse the sexes, and you have a plain, commonsensible comment upon one-sided diatribes against the sex which has for ages had the name of the dominant power.

Centuries of depreciation of women's mental caliber—centuries which made possible the masterhood of husbands and the serfdom of wives—have left their trace upon the bully and the illiterate. Semi-occasionally, one meets with a so-called educated man, who contends that ancient conditions are unalterable because they are the appointment of Him who made the man first, and then the woman. Such do not represent the reading public for whom our Professorin writes and THE INDEPENDENT prints.

As a woman who loves and champions her sex, and who has lived a long time in a world which is as yet new to our

frank and able "Bachelor Maid," I deny emphatically that brutality, lust and barbarous selfishness on the part of men are the rule in communities composed of reputable, English-speaking people who send their daughters as well as their sons to college, and are themselves law-abiding, God-fearing citizens. Physicians and vital statistic records prove that large families are the exception with native born Americans. Philanthropists will testify sadly to the blindness of wife-seekers in never taking into consideration such questions as guide stock-raisers. Tupper's admonition to the ardent Coelebs of his generation to "think of the children whom the Lard may give thee of her," has no place in the thoughts of the young man who would a-wooing go in free America. In point of fact, your athlete, glorying in his youth and muscle, is more likely to set his affections upon a narrow chested, hipless wisp of a girl, whose fragility appeals to his affluent vitality for protection, than upon the broad-jumper, fast runner and deep breather who has carried off field prizes at Vassar or Bryn Mawr.

Since plain speech is the order of the day, I subjoin as the sad conviction of one to whom the prospect of race suicide is abhorrent that generations unborn would have a better chance in the survival of the fittest if this matter of physical sanity were considered seriously and long before the choice of husband or wife is made.

Our Professorin has had her maiden dreams, we learn from herself. She has so far encouraged these fancies as to formulate a matrimonial creed, and to defend it:

"I have expended a considerable amount of breath and cerebral matter in arguing that the only ideal marriage would come when the husband and wife stood on an equal plane in intellectual equipment and freedom to use it."

This sentence is in close connection with the assertion that if men do not actually prefer fools to sensible women the fool makes a better wife than one who stands upon an equality, intellectually, with her husband. The imputation dishonors our sisters and our brotherman. The imagination of the candid reader sets beside the solitary instance to the contrary cited by "A Bachelor Maid" a long line of married lovers—wedded in mind and in heart—who have wrought together to make the world better and happier.

The William Howitts; the S. C. Halls; the David Garricks; Sir Charles James Napier and his accomplished consort and literary collaborator; Chevalier Bunsen, erudite to a marvel, encouraged and aided in his almost unparalleled literary career by the woman he adored—and to whom he paid the tribute, in dying—"In thy eyes, dear wife, I have seen the Eternal;" the Robert Brownings; George Henry Lewes and "George Eliot;" in our own country Dr. Stowe and Harriet Beecher, his wife; Dr. Howe and Julia Ward, his wife—time would fail me were I to attempt a list of those whom the age delights to honor. I would not dare essay to catalog the vaster number of wedded worthies whose fame has never gone beyond the circumscribed areas glorified by their indwelling and joint labors. We have all read and admired Dr. Holmes's beautiful figure of the great vessel moving majestically out of the harbor, impelled and guided by the gallant little tug which has locked arms with it. In this connection I may observe that one of the choicest autograph letters in my possession is from the genial "Autocrat," in which he says, apropos of a book he had done me the honor to read and to like:

"*I* ought to know something of the worth of 'Eve's Daughters,' having lived with one of the best of them for forty years."

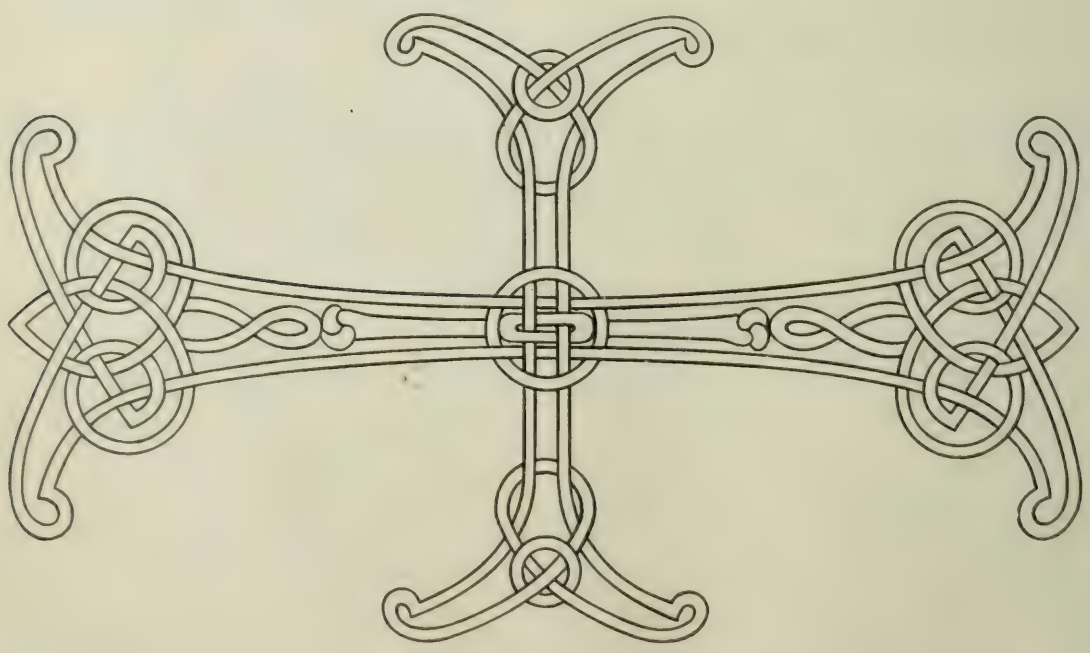
No amount of higher education will shake, much less reverse, the heaven-ordained law of the gravitation of man to woman and woman to man in the relation which brings more joy and more of joy's dark relative minor, sorrow, into the solemn *opus* we call human life than all other influences combined. If it be a pious platitude to link the names of Home and Heaven and to talk reverently of the glory of Motherhood, the platitude has a sublime precedent. The communion of saints is the Great Family on earth and in heaven; when the All-Father would let us into fullest comprehension of his love, he likens it to the mother's devotion to her offspring.

"So far as my circle of acquaintance goes there is precious little foundation in fact for the repeated assertion that the rearing of children develops the noblest qualities in woman," says "A Bachelor Maid," and with more flippancy than aptness or good taste.

The limitations of space forbid me to argue this point. Suffer but one suggestion. We immortalize the utterance of the painter who spent years in poverty and toil that he might approximate the ideal he had set for himself when he adopted his profession, excusing what his critics termed "willful waste" by saying, "I paint for posterity." We mothers work for posterity in a truer and higher sense of the phrase.

One more, and a final, quotation from our vivacious essayist:

"To me, if I would have love and a home, the alternative presented is the renunciation of every other dear ambition. Perhaps I have no right to have any other ambition, but *it is there*, and it has grown up with me. . . . It is an honest love for the studies of which my school days gave me a glimpse, and of which the pursuit of my profession opens an ever-widening vista."



Then—in heaven's name and for the sake of that section of humanity commanded by the ever-widening vista, let her renounce all thoughts of marriage, and give up playing at love-making, which, from her point of view, is downright degradation! Let her content herself, once for all, with the dear ambitions nobody who knows her should tempt her to forego.

As to the compulsion laid upon her conscience by officious match-makers, we may borrow Tallyrand's retort to the luckless lampoonist's "*Mais Monsieur, il faut vivre*"—

"*Je ne vois pas la necessité!*"

"A Bachelor Maid," with all her brains and ready wit, has been singularly unlucky, according to her own showing, in the matter of masculine acquaintances, particularly unfortunate in her several betrothals, and not happy in her selection of women friends. I fail to see any propriety in the further prosecution of love affairs, or in hearkening to the solicitations, as futile as ill-judged, that she would abandon what she considers dignified and ennobling for an ignoble sphere and downright "humiliation."

POMPTON, N. J.

Literature

Lord Acton's Letters*

Lord Acton is known as the prodigy of historical learning, who wrote hundreds of articles but never a book, and who had an ambition all his life to compose a History of Liberty. He made no secret of his desire to his friends and referred facetiously to it—"'H. L.,' p. 20,000." He was by descent German and French as well as English, and spoke and wrote these languages and Italian with equal facility. He was born in Italy a Catholic, lived in youth and maturing as much on the Continent as in England, was a schoolboy under Cardinal Wiseman, was refused admission, as a Catholic, at Cambridge, and did better by putting himself under the tuition of the great German ecclesiastical historian, Dr. Döllinger; he then spent some time with his step-father, Lord Granville, who was British Ambassador at St. Petersburg. He returned to England, after a visit to the United States before the Civil War, and entered the House of Commons, representing an Irish Catholic constituency, and there fell under the spell of Mr. Gladstone, and became his most enthusiastic admirer, and, in a measure, counselor. From the House of Commons Acton came into the House of Lords, there a stiff Liberal. But he was much abroad, and was intimate with the most distinguished scholars and public men of France, Germany and Italy, as well as of Great Britain. Meanwhile he was editor for some years, of Catholic Liberal journals that met the condemnation of Cardinal Wiseman; he went to Rome to oppose the decree of Papal Infallibility; and he pursued his historical studies, collected a private library of 60,000 volumes, carried on an extensive correspondence, was most generous in his help of other students, and ended his life as Professor of History in the university which had refused to admit him as a pupil; and there is garnered his great library.

Lord Acton carried on for many years an intimate correspondence with the daughter of Gladstone, who remained with her father until his death, and who is less known as Mary Drew than by her maiden name. In these letters, a portion of which is here published, Lord Acton speaks with all unreserve of men and things. We see in them the noble, high-spirited man more even than the erudite scholar, but also the man of the world, who loved the society of intelligent men, and who was deeply interested in every cause that affected the progress of Liberty. Perhaps what most interests Mrs. Drew, in her selection of these letters, is the devout loyalty of the writer to her father's fame and fortunes. But on that we need not dwell, altho it gives the chief character to the volume. It is other matters that will most repay reading.

We will not dwell on Lord Acton's remarkable criticism of the historical setting of "John Inglesant," altho it leads up to the very important subject of the relation of the Papacy to Liberty. The most vital question in Lord Acton's judgment of men was their relation to pure morality. He was desperately afraid of religion divorced from morals. And he was so strict in his moral judgments that he would excuse no departure from rectitude on the ground of utility to a cause in which he believed. He insisted that a cause should never be condemned for the moral obliquities of its defenders, and equally that their crimes must not be condoned because they belong to the right party or creed. So he hated Uultramontanism in the Church, and the Jesuits, because he held that they defend lying and murder. Nor did he spare the Popes. No Protestant could speak stronger than he did in his unrestrained freedom:

"The Inquisition is peculiarly the weapon and peculiarly the work of the Popes. It stands out from all those things in which they co-operated, followed or asserted as the dis-

* Letters of Lord Acton to Mary Gladstone. *Edited, with an Introductory Memoir, by Herbert Paul.* 12mo., pp. 353. The Macmillan Company, New York.

tinctive feature of Papal Rome. . . . The principle of the Inquisition is the Pope's sovereign power over life and death. Whoever disobeyed him should be tried and tortured and burnt. If that cannot be done, formalities may be dispensed with, and the culprit may be killed like an outlaw—that is to say, the principle of the Inquisition is murderous, and a man's opinion of the Papacy is regulated and determined by his opinion about religious assassination." Page 299.

"Newman defended the Syllabus, and the Syllabus justified all those atrocities. Pius the Fifth held that it was sound Catholic doctrine that any man may stab a heretic condemned by Rome; and that every man is a heretic who attacks the Papal prerogatives."

Of "the Vatican System" he says that it "stands or falls with the doctrine that one may murder a Protestant," p. 282. Hear him again:

"If he accepts the Primacy with confidence, admiration, unconditional obedience, he must have made terms with murder. Therefore the most awful imputation in the catalog of crimes rests, according to the measure of their knowledge and their zeal, upon those whom we call Ultramontanes. The controversy, primarily, is not about problems of theology: it is about the spiritual state of a man's soul who is the defender, the promoter, the accomplice of murder." Page 299.

And yet Lord Acton was a good Catholic, all the better because he dissociated theology from morals, and held that the Papacy was responsible for terrible crimes. He would not hide or excuse these crimes, for he held that "to have no moral test of duty apart from religion is to be a fanatic," a golden sentence.

We have room for but a word as to Lord Acton's thought of history. To him it was not a record of men, nor a running memoir of statesmen and soldiers, but a development of the rise and growth of formative ideas, and those ideas principally moral and religious. Hence his unaccomplished History of Liberty. He says, in comment on his list, not published, of a hundred books which he would have a son of his read:

"We all know some twenty or thirty predominant currents of thought or attitudes of mind, or system-bearing principles, which jointly or severally weave the web of human history and constitute the civilized opinion of the age. All these, I imagine, a serious man ought to understand, in whatever strength or measure they possess, in their causes and effects and their relations to each other. The majority of them are either religious or substitutes for religion. For instance, Lutheran, Puritan, Anglican, Ultramontane, Socinian, Congregational, Mystic, Rationalist, Utilitarian, Pantheist, Positivist, Pessimist, Materialist, and so on. All understanding of history depends on one's understanding of the forces that make it, of which religious forces are the most active, and the most definite." Page 278.

We have quoted characteristic passages which give the type of mind of a great man and scholar, who believed in no faith beyond reason or above morality, who declared that "faith implies sincerity, that it is a gift that does not dwell in dishonest minds," another golden sentence.

High Noon*

THIS is a volume of short stories in which the author treats of the poetic relations between men and women. And if any infer that sex has something to do with it, they draw a biological inference which she studiously avoids. Sex is simply the hexameter with which she measures the experience, nothing more. Now, there is but one older, more baffling subject—that is the relation of men and women to God. We settle all our other problems every thousand years or so, but no one has ever been able to tell where reality ends and imagination begins in these two relationships. According to Alice Brown, however, there is the same spiritual basis for both. The question is, how far do these "High Noon" illustrations of human nature in lovers' trances go to prove her theory? To begin with, she shows an admirable artistic faculty for illuminating the shekinah of feminine consciousness. And it is not so wonderful that the heroine often mistakes an ordinary man for a god in the soft effulgence of her own altar radiance. This hallucination, indeed, accounts for the goings on of more than one heroine in these stories. Instead of receiving her lover outside among the realities of life, she coaxes him into this candle-lit space sacred to the feminine soul and tries him by a little secret code of love practiced only by women. Naturally, he is confused, crestfallen; natural-

* HIGH NOON. *By Alice Brown.* New York: Houghton, Mifflin & Co. $1.50.

ly, instead of thanking God for his limitation, he gallantly falls upon his face, swears he is of the earth earthy, and no more worthy to kiss the hem of her garment. But, whether Alice Brown knows it or not, there is really no such difference of soul cubits between them as this situation indicates. It is nothing more than the woman's incantation of love, and not the index of her character. Take the case of Elinor in *The Book of Love:*

"She gave the impression of being very, very well, of being related to wholesome things, kin to fire, and water, bread and apples, and all the elements most immediate in life."

That is what the woman really was, and the man is attracted, not by her soul, but by her "elements." His affections had already been invaded by a woman who immodestly gave him her soul to kiss, and he had very properly resented the vulgarity. Imagine, then, his disappointment when this healthful creature, whose sanity he had complimented, answers him in this fashion:

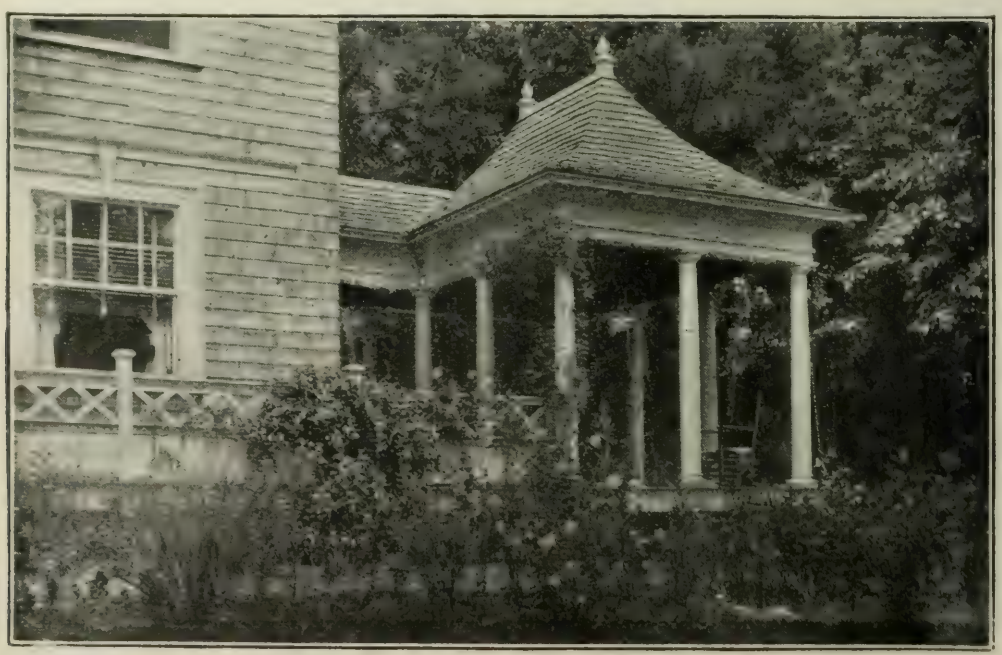
"I am lonesome, I am almost afraid. When we first knew each other, I thought that spark, struck out of the darkness, would light the world. It did not go out. You love me. *But it does not light the world.* In the first days you were like a strong spirit, radiant, on fire. . . . We women are children, dear. We have to be assured, reassured, warmed, soothed, warmed and tended. We cannot take things for granted. . . . You said the other day I wanted life to be lived on tip toe. Perhaps I do. I want it to be vivid, fragrant."

And all the time the man was swearing by all his gods and goddesses that he loved her, etc. There is a continuation of the same class of revelations in *The Map of the Country,* and it is evident that the author would convey the impression that all women are morbid, timorous, exacting, where their romantic affections are concerned. But as a compensation for this defect she represents them as rejoicing in platonic love. The initial story is based upon this ideal. But here again she has missed the truth by a fraction. Women are indeed capable of platonic love, but they are not in the same degree capable of being satisfied with it in return. The more a woman is advanced in the scale of things, the readier she is to love in the platonic way, and to get herself loved every way she can be loved in return. Thus the hero of this story is charmed into proposing marriage to the very ghost of a woman, who has been shriven of all save her platonic faculties and a desire, strong even in death, to be loved warmly, really, by her lover. The explanation is not feminine selfishness, but their helplessness. It is the appeal they make to a vitality stronger than their own.

A genius capable of dissolving love into a purely spiritual animation is also able to divorce the spirit from the flesh without the vulgar shock of death; and so we have more than one instance in this book where the wings of living people are uncannily evident. But the important thing to note at last is the dignity and purity of every conception. These stories portray the ideality of virtue as opposed to the more sensual imagery of vice, and all is written out with the virgin delicacy of a woman's mind.

The Crossing. By Winston Churchill. New York: The Macmillan Co. $1.50.

In an afterword, Mr. Churchill gives a modest, but excellent, review of his own novel:



"I have tried to express in it the beginning of that great movement across the mountains which swept resistless over the Continent until at last it saw the Pacific. The Crossing was the first instinctive reaching out of an infant nation, which was one day to become a giant."

That is to say, he has undertaken to dramatize in fiction the advance of pioneer civilization, which begun with the Scotch-Irish emigrants from the older Carolina colonies into the half defined state of Franklin (now Tennessee), and with Daniel Boone's settlement in Kentucky. The important characters were famous frontiersmen in those days, Nollichucky Jack, Andrew Jackson, Colonel George Rogers Clark and others. The story also includes Clark's famous campaign, which added Ohio, Indiana and Illinois to the infant Republic. And the movement reaches so far that the author has been obliged to present every form of existence in the new territory, from the besieged stockades of the Kentucky pioneers to the seigniorial life of the tidewater regions, from the first Indian massacre in the Dark and Bloody

Ground to the date of the Louisiana Purchase. As Mr. Churchill remarks, "It is a difficult task to gather together the elements necessary to picture this movement," and certainly he shows no originality in selecting them. The hardships endured by the settlers, the Indian raids, the miraculous escapes recorded are familiar details to those who have read any story of American pioneers. In all such stories there must be a character invented by the author, whose business it is to fill up the historical blanks in the narrative. He is a sort of general utility man, ready to play any part assigned him. David Richtie is this important personage in *The Crossing*. As a child he is the mascot in Clark's frontier army. Later, he is the master of ceremonies, who introduces every important man in the country, and gives him a seat somewhere in the story. Even if a statesman is needed, he is hurried away, educated, and returned before the end of the chapter, able to solve the most difficult problems of the young commonwealth with delicacy and dispatch. And when in the course of events a lover is needed he is the first man found bowing upon the scene. Of one thing there can be no doubt, he conducts the reader courteously through an interesting story, particularly significant now when the great Fair at St. Louis commemorates the sequel, which is the Louisiana Purchase.

American Renaissance. By Joy Wheeler Dow New York: William T. Comstock. $4.00

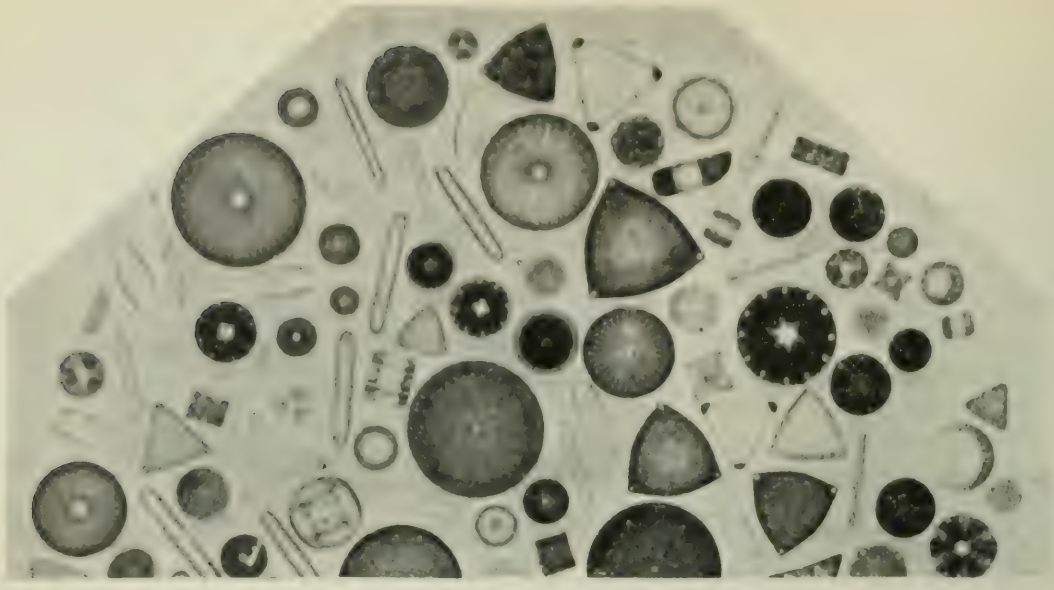
In his review of American architecture Mr. Dow has certainly massed a wealth of illustration. He has considered his subject from a popular rather than a purely technical viewpoint, and the result has been a book that the home-building masses may read with much profit as a preliminary to building on their own account. Step by step Mr. Dow has traced the development of architectural styles at various epochs until the evolution of a style has been reached which he has termed the *American Renaissance.* There is certainly a deal of difference between the shack of the savage that is calculated only to shelter the human animals who use it from some of the inclemencies of the weather and the houses that Mr. Dow has considered in his book. The finest houses are now something far more than mere shelter. They minister to a taste that is esthetic to the highest degree, and shelter is only incidental. It is an encouraging sign of the times to find more and more attention being paid to habitations, and the publication of the present volume is a hopeful indication of a growing and more general appreciation of the charm of architecture on the part

Peristyle to a House in Wyoming, N. J. 1897. Designed by Joy Wheeler Dow. From "American Renaissance" (Comstock)

of a large class not heretofore so intimately interested in the theme. The typography of the book is pleasing and the author's cover design is happy.

Bird Center Cartoons. A Chronicle of Social Happenings at Bird Center, Illinois. Pictures and text by John T. McCutcheon Chicago: A. C. McClurg & Co.

In this volume are collected thirty-four full page reproductions of cartoons which have made Bird Center—and McCutcheon—famous, together with a number of small sketches, a list of the "elite" and the newspaper reports of their "social functions" by "ye editor." The doings of a country town and the style of country journalism have never before been more amusingly depicted, yet here, as in his political cartoons, Mr. McCutcheon shows the rare faculty of being able to satirize without offending and to ridicule without abusing.



The Picnic.—From "Bird Center Cartoons," T. Y. Crowell & Co.

The House of Quiet. An Autobiography, Edited by J. T. New York: E. P. Dutton, 1904 $2.50 net.

Most of us have known some quiet personalities of deep and elusive charm that hold our affection changelessly. Yet to introduce one of these fine souls to another is not always a felicitous consummation. So the reviewer, having found a book of this personal gift, may offer with a certain reluctance what has become to him in his careful perusal an intimate thing. "The House of Quiet" seems not designed for the public; it is very lacking in pose, in gossip, in "confessions," in any striking of attitudes. It is the life history—not the diary—of an English gentleman of culture and wealth, forced to the rôle of semi-invalid in what should have been his most active and ambitious years. In sensitiveness to beauty and to pain he was of the artistic temperament, but a certain intellectual honesty saved him to the ranks of the Miltons that are mute. Perhaps there is a peculiar value to a voice out of that multitude inglorious, of whom the Great Silence is so jealous—living and dead. Life is significant, tho obscure, and quite as dignified and as happy an accomplishment as under the stimulus of affairs, of power, of fame. To find that artistic ideals are not after all matters of pre-eminent national or even moral importance, to come even to be profoundly grateful that literature and art play a very small part in the lives of the majority of people, to end "a true brother of men and filial lover of the earth" is an experience of sincerity. The profession of neighborliness is here presented with the finality of long perspective. There are touches of humor in it. The import of experience is the thing everywhere sifted from the material, ephemeral fact, to the demonstration that escape from the tyranny of detail and the living of the simple life on great principles is quite possible, and is the sum of wisdom. If, as Johnson has said, "Every book should help us either to enjoy life or to endure it," this may lay a double claim to esteem.

Minute Marvels of Nature. Being some revelations of the microscope exhibited by Photomicrographs. By John J. Ward. New York: T. Y. Crowell & Co., $1 50.

As an introduction to the many beautiful and interesting things in the world

Group of Diatoms; Actual Diameter, ⅛ Inch.—From "Minute Marvels of Nature," T. Y. Crowell & Co.

revealed by the microscope this book will be very useful to young and old. There are 185 photomicrographs, of which we reproduce one, illustrating diatoms, desmids, pollen, plant structures, the eggs and weapons of insects, and the hairs, feathers, scales and skin of larger members of the animal kingdom. The descriptions are clear and simple, avoiding the use of unnecessary scientific terms. The book is especially adapted for a school or public library, for any person will enjoy looking it over, and it may lead some to a use of the microscope in a search for similar discoveries for themselves.

The By-Ways of Braithe. By Frances Powell. New York: Charles Scribner's Sons. $1.50.

A type of novel apt to repeat itself every few years is the domestic sensational. "Jane Eyre" delighted our grandparents in just the same way that we have enjoyed "The House in the Marsh," or shuddered over "The House with Green Shutters," a year or two ago. Our parents read "Bleak House," "The House of Seven Gables" and "The Fall of the House of Usher." What sort of houses will give our children delicious little shivers down the spine we do not know, yet we fancy they will not be very unlike Miss Powell's houses on the Hudson. Braithe Manor is one of them, built by a Braithe of evil memory, a copy of the ancestral home in England, even to a "portent" which most common-sense Americans would think an undesirable possession. *The By-Ways of Braithe* reminds the reader faintly of "Jane Eyre," not that it is written by a new Charlotte Bronte, nor that the characters are so sharply individualized as in that remarkable romance, but the plot interests in much the same fashion; the stern and somewhat elderly hero has a touch of Rochester in his make-up. The heroine is more like the "Beulahs" and "Ednas" and "Fledas" of a generation ago. She is a beautiful "saint," with just enough of a tendency to flirt to keep her human. Lillian Braithe, her sister, does not convince us of her reality, or plausibility even. She is an impossible person, and her cruel remarks are not such as even a "saint" ought to endure. The house parties held at Braithe are curious affairs; the host divides his friends in the smart set into three classes: "Fast, Fine and Firm," and entertains them in that order. The readers of the book are only privileged to meet the first class, and if their manners are correctly delineated we would prefer to be invited later in the season another time. Still the story of their visit at Braithe will keep the reader awake on the sleepiest of summer days. Some of us have long fancied that houses have a physiognomy, real houses—that is, not maddening rows of cubical cells—and we are half persuaded that they have a psychology of their own as well. But can houses reform, change their sinister ways, and become respectable members of architectural society? *The By-Ways of Braithe* would seem to say so.

The Memoirs of a Baby. By Josephine Daskam New York: Harper & Brothers. 1.50

A bright little book, well illustrated with pen sketches by F. Y. Cory, suitable to read aloud, tho only a chapter at a time, on the shady veranda, while the listeners swing in hammock, or to be packed with the lunch for a picnic in the park. It is a clever tho somewhat prolonged satire on the unpractical and diverse instruction given to mothers by the various guides on "child culture." Any book with a real live baby in it is sure to be popular, and Baby Martin

From "The Memoirs of a Baby"
Copyright, 1904, by Harper & Brothers.

and the relatives who experiment upon him are so much like the inhabitants of other nurseries that the book is likely to sell as well as "Helen's Babies" and "The Heavenly Twins." We could not assert that any young parents would learn how to bring up a child by reading these *Memoirs,* but they will certainly have their confidence in the infallibility of their own preconceived theories shaken, and this is the beginning of wisdom.

After Worcester Fight. By Allen Fea. With numerous sketches and photographs by the author, together with portraits. John Lane of the Bodley Head, London and New York.

The existence of such books as this and its predecessor, "The Flight of the King," testifies to the power of the misfortunes of royalty to interest a certain class of minds. Great pains appear to have been taken to attain accuracy of detail in regard to the shifts and chances of the not too glorious escape, after the battle of Worcester, of the handsome, sensuous and withal melancholy faced youth afterward known as England's "Merry Monarch." To readers who take a perennial interest in the fortunes of the fated and fatal Stuarts these details will possess a certain degree of the charm which has always attached to the descendants of Mary Stuart and of Henry of Navarre.

Editorials

The semiannual index of THE INDEPENDENT is now ready and will be sent free to any subscriber who will notify us that he wants a copy. Of course, those who return us the 26 issues of the magazine will have the index bound in the volume.

A World Legislature

THERE is more than a fascinating magnitude, appealing to wide-visioned men, in the idea of an international parliament. It is a practical idea. War is a frightful waste of resources, to say nothing of its indescribable cruelties. The world has entered upon an age of industry. The demand for an adjustment of conflicting interests by means less costly than fire and sword will continually grow stronger. The economic instinct will more and more reinforce the imperative of humanity.

Because of its eminently practical quality the article by Mr. Hayne Davis on "A World's Congress," which we publish this week, merits serious consideration. Mr. Davis's argument that an international court like The Hague Tribunal can never play a large part in international affairs, unless it is backed up by international legislation, is convincing. It is well to be reminded that in the evolution of political institutions a certain inevitable order has always been followed. The wager of battle between individuals, between hordes or clans, between tribes, between petty states, has slowly yielded to adjudication. Attempts to adjudicate have revealed the necessity of discussing conflicting interests in a comparative way. Out of discussion and comparison have emerged general rules or principles of positive law, and these thenceforth have been made the basis of judicial decision. Adjudication has always preceded legislation and legislation has always been the normal consequence of adjudication.

There is, however, yet another phase of political evolution. Mr. Davis does not take account of it, but it must be thought about before the merits of his plan can intelligently be estimated. Adjudication and legislation have hitherto been followed by an evolution of executive power. Just as the court gives birth to the legislature, so the legislature, desiring to enforce its acts, delegates power to an executive agent to organize and employ the physical force of the commonwealth. Historically the executive branch of government is created by the legislative branch—the seeming exceptions are apparent only—and sooner or later the legislative body always has, as a matter of fact, created executive power.

While, therefore, the parallel is interesting and suggestive, that Mr. Davis draws between conditions that in England, the United States and elsewhere have led to federation and federal legislation, and existing international conditions that call for the creation of a world congress—it is incomplete. Mr. Davis does not argue that the time is ripe for a world-wide federation of nations under a completely unified government, comprising the executive as well as the legislative and judicial powers. Yet, without an executive agent and organization, the acts and resolves of a world legislature would have a merely advisory force.

The nations of the world are certainly not ready for such political integration. In the distant future they may accept it, but any present hope that war may be made an end of by this means is surely doomed to disappointment. The proposition to establish an international legislature, therefore, must be considered with strict reference to whatever value the resolves of such a body might have as advice or recommendation, appealing to the reason and the conscience of civilized men, and enforceable only by the power of public opinion.

Looking at the question in this way, we do not doubt that the proceedings of a world legislature would be of inestimable worth. Intelligence and conscience are neither constant nor diminishing factors in the life of mankind. Generation by generation they are becoming might-

ier and more active forces. A world legislature, bringing together some of the best minds of every realm, for the discussion of international interests and for the formulation of general principles that ought to govern international relations, would powerfully promote the growth of both intelligence and conscience. It would be a forum in which the best public opinion would be created.

Moreover, discussion in and of itself discourages resort to violence. It delays, it inhibits action. To a certain extent the mere habit of discussing international relations in a world legislature would operate as a discouragement of war, even in the absence of any power to enforce decisions. And this consideration suggests a further thought, that may have in it the germ of prophecy. Thus far in political history legislatures have always established executive power because they themselves have been expressions of the will of mankind to command and to compel obedience. As organs for the creation of standards, of principles and of ideals appealing to reason and conscience only, which the people would obey without being forced thereto, legislatures would need no executive power. Is it not possible that in a legislature of the world we might have the beginning of that highest and ideally desirable regulation of human conduct from which executive enforcement should have disappeared?

George Sand

A CURRENT novel usually falls into one of two classes. It is either a feat of strength or a sleight of hand trick, according to the kind of man that performs it. The one sort is the man of ordinary parts and extraordinary vigor, who has taken to writing as he might have done to business and has made a success of it by the same energetic methods as would have carried him on in trade or politics. The other is the dilettante or "artist," who trifles curiously with literature as an elegant accomplishment, very much as one might learn to write or speak a dead language. In either case the product has lost its distinction and charm and become infected with a vague trouble, a kind of nostalgia, the result of a lack of fitness in those who have tried to make themselves at home in it. For what is very rare and exceptional in literature nowadays is evidence of any other qualification than a more or less painfully acquired dexterity.

Nor is the reason of this state of affairs far to seek. Every art, the art of the novel as well as another, tends after a while to become deliberate. Its powers are enlarged and multiplied, its requirements increased, its *procédés* grow into a code, its practitioners are forced to study it consciously, and a criticism gradually grows up around it, until its methods are so thoroughly discussed that any one can learn to turn a phrase or put together a plot or conduct a dialog as well as the best of the great originals. In short, the novel has become by this time a trade or an "art," to which men turn as advisedly as to horseshoeing or the carving of cherry stones. People, too, begin to talk about it, the papers are full of it, not as a living tissue of ideas, but as a commodity or curiosity—its sales, the process of its manufacture, the personal habits of its makers, and what not. It is literature no longer; it is only a book.

To this mercantile or commercial view of literature George Sand stands as a contrast and a lesson. If one would touch at once the spring of her power, that which gives her distinction and originality, it is as an improvisatrice that she must be considered. In this respect she has probably never been equaled. While Balzac and so many others for several generations were laboring painfully all around her, wringing out their work in paroxysms and convulsions, she was flowing easily in a copious, limpid and seemingly inexhaustible stream of prose. No one, whether critic or acquaintance, has ever spoken of her spontaneity without admiration. Gautier returns from a visit which he has made her in the country, amazed at the ease and regularity with which she wrote, without any of that excitement, anxiety or irritation which we have come to associate with literature. "Imagine," says another contemporary, "that you have a faucet open in the house; some one comes in, you close it. . . . That's the way with Madame Sand." "No

writer," asserts Mr. James, "has produced such great effects with an equal absence of premeditation."

This, then, is the source of George Sand's power—the facility of native endowment. Dissect her novels and you will find nothing so very tremendous according to present notions. There are no great characters, no very profound or permanent problems, no massive architectonics. And yet at her best she has produced what is perhaps the highest achievement of literary art, a perfect style—at once refined and original, thoroughly simple, flexible and picturesque, where the image is still idea and the idea image—a style which owes its felicity to the literary qualification that is to-day the least reputed of all and is yet the most essential to natural gift.

A hundred years have passed since her birth, July 5, 1804, but her novels show no decline in popularity. They are among the few which stand the change of language and the lapse of time. They are not only to be found everywhere in the serried ranks of "standard literature," but, what is a better proof of their human interest, they are among the most worn and soiled in every public library.

Hats Off

It is so rare that a comfortable and hygienic costume or custom becomes fashionable that we hardly dare to call attention to the fact that it is becoming permissible for both men and women to go without their hats lest Fashion, realizing that she is in danger of becoming sensible, should change her mind and again press upon our enfranchised brows the cruel boxes which we have worn so long. But the movement seems to be the resultant of so many forces as to be irresistible. We see every day men riding on horseback and even in carriages through the city streets without hats; in time they may even walk so. They may now if they carry golf sticks or tennis rackets to prove that they are rich enough to afford hats. The summer girl, with an oriel window on her chest and her sleeves run down at the heels, and her hair like an overhanging thatch or poorly built hay stack, wanders hatless along the sea beach or through country lanes. What a few years ago was only a twilight privilege and restricted to a radius of a hundred yards has become gradually extended in time and space.

College boys and girls, whose brains most needed room to expand and the passing breezes to radiate off the heat generated by their burning thoughts, were among the first to adopt the innovation. The habit of the school time and of the vacation season will inevitably tend to be carried into ordinary work-aday life until, let us hope in the course of the present century, a man may go hatless to his shop or office without fear of encountering the shrill reproach of that most uncompromising of conservatives, the small boy.

In England the anti-hat movement has assumed the dignity of a reform, a crusade, with all the usual paraphernalia of societies, pledges and demonstrations. It is said to have begun in Leeds, and to have spread amazingly through the country, and even to have invaded London, where, according to the *Daily News*, "the reformers" may be seen every evening about five or six o'clock passing bareheaded to their homes.

It has long been recognized that during a large part of the year and in sheltered city life no covering is needed for the head. Hats are neither useful nor ornamental, only customary. The evolution of the hat has been in general an alleviation. The iron helmet gave way in time to the "stove-pipe." This rounded into the Derby, and dimpled into various forms of soft hats. The straw hat, since it is neither light, handsome, cheap, comfortable, durable nor protective, fulfilled all the requirements of fashionable raiment, but when hats from Panama and other zones became cheap their ugliness was visible to the naked eye, and it was felt more distinctive to go bareheaded.

Feminine headgear has undergone a concomitant process of elimination. Women used to bear water jars and bundles of fagots on their heads. Later these burdens were exchanged for circular zoological and botanical gardens. Like the planetary rings of the nebular theory, this disk became continually flatter, wider and thinner, until it became a mere halo above the woman's head.

Now even this fades away as we gaze. Any halo does when we look closely at the person wearing it. It must be admitted, too, that not every woman is entitled to a halo. Some have a style of beauty to which such a saintly decoration is unbecoming.

Indoors in public places men have long been privileged to doff their hats, and women are now following suit. In Wyoming, where women have the ballot, feminine selfishness in one of its most obnoxious forms was suppressed by a State law requiring women to remove their headgear in places of public amusement. By means of laws, polite requests, public remonstrances and, let us be charitable enough to believe, some twinges of conscience, the same result has been attained in most cities of this country. In theatres everywhere now all the ladies among the spectators wear no hats. Only the ladies who are on exhibition, on the stage or in the boxes, keep the old custom.

Churchgoers are not yet become as Christian in this respect as theatergoers. Instead of sending around question blanks to ascertain why men do not attend church, it would be more to the point—and require less stationery—to inquire why men do go to church when the chances are two to one that they cannot see the minister's face. If they want to look at birds and insects and flowers they can see more and better ones in the woods, alive and growing. Women are not equally annoyed, because if a cart-wheel hat shuts out their view they can spend a pleasant and profitable hour in studying millinery. Last Sunday clergymen in Newark and Jersey City asked the women in their congregations to leave their hats at home. It is to be hoped that women in other churches will be considerate enough to do this without clerical admonition. If they do not, it might be well for the men to force the issue by becoming Jews. A plug hat is not so wide as a church door, but it will serve.

The laws of etiquet require that hats shall not be worn in the presence of rulers. But in America every man is a king and in several of our States all the women are queens. Let us, then, uncover in deference to our royal peers.

The Strategy of Two Wars

History repeats itself, but rarely with such close similarity as in the two campaigns of the Japanese in Korea and Manchuria ten years apart. The same order of movements has been followed this year as in 1894, the same strategy has been employed and so far with almost identical results. Only the enemy is different; but not so different as might have been expected. The Russians seem to have learned nothing from the experience of the Chinese. Evidently in their war college textbooks there is no chapter dealing with the Manchurian war of ten years ago. As the military expert of the London *Times* says:

"Whether the Russians had ever heard of the battle of October 25th, 1894, we cannot tell; all we know is that they occupied the same positions as the Chinese, were misled by the same ruses, and destroyed by the same attacks from the same direction."

On the other hand, the Japanese army is composed in part of the same men fighting under the same commanders in the same country. The "Yamagata opening" has been played a second time with equal success, and now the Japanese occupy substantially the same position as they did at the close of 1894. Now, as before, the three armies, marching from Feng-Wang-Cheng on the east, from Siuyen on the southeast and the Liao-Tung peninsula on the south, have joined and together present a concave front of a hundred miles in extent, threatening at one time Hai-Cheng, Liao-Yang and Mukden. The map in our "Survey of the World" giving the movements of the present campaign would serve as well to illustrate the former. Five months after the first landing of troops in Korea they are where they were after six and a half months in 1894, with the very important exception that Port Arthur is not yet taken. In 1894 Port Arthur was defended by 10,000 Chinese with 330 guns. Now there are five times as many soldiers in the beleaguered fortress, which is as nearly impregnable as Russian military science can make it. The presence of the fleet in the harbor will also make it impossible for the Japanese to employ the same tactics and carry the main fortifications by assault in a single day.

The most important deviations in the two wars are due to the necessity of confining the operations to Manchuria. Wei-Hai-Wei is now a British port. The Japanese could land this time at the northern Kin-Chau because this is outside of Manchuria. There has been no single naval engagement to compare with the battle of the Yalu on September 15th, 1894, and since Admiral Togo has kept the Russian fleet confined to Port Arthur the Japanese have been free to land troops wherever they pleased; at Taku-Shan and on both sides the Liao-Tung peninsula.

The Japanese have beaten their former record for the occupation of Korea. It was nearly five months after troops were landed there before the Chinese were driven north of the Yalu, while this year the Russians were similarly dispossessed in less than three.

In the number of troops engaged and losses on both sides the present war is, of course, by far the more important. At the end of 1894, that is at about the same stage as is reached by the war now, the total losses on the Japanese side were 430 killed and 1,712 wounded. The Chinese lost in the same length of time 6,676 killed and 9,696 wounded.

A Comparative Chronological Table of the Two Wars.

Chinese-Japanese War, 1894.	Russian-Japanese War, 1904.
May, 1894.—Chinese troops invaded Korea.	Jan., 1904.—Russian troops invade Korea.
June 3.—The Japanese Government announced at Pekin its intention to take any necessary measures to protect its interests in Korea.	Feb. 6.—The Japanese Government announced at St. Petersburg its intention to take any necessary measures to protect its interests in Korea.
June 8. — Japanese troops landed on the west coast of Korea.	Feb. 7. — Japanese troops landed on the west coast of Korea.
July 25. — Japanese cruisers attacked a Chinese war ship and transport going to Korea and sank the latter. In another engagement the same day two Chinese cruisers were sunk.	Feb. 8.—The Japanese fleet destroyed the "Variag" and "Korietz" in the harbor of Chemulpo, Korea.
Aug. 1. — Formal Declaration of War by Japan.	Feb. 10. — Formal Declaration of War by Japan.
Aug. 11. — Twelve Japanese war ships and six torpedo boats entered the harbor of Wei-Hai-Wei at midnight to surprise the Chinese fleet. Foiled by the commander of a British war ship, who "fired a salute."	Feb. 8. — Japanese torpedo boats attacked at midnight the Russian fleet at Port Arthur and disabled three vessels. Repeated attempts to block the harbor during the next two months.
August. — Japanese troops landed in Korea at Fusan, Wonsan and Chemulpo. Seoul occupied.	February. — Japanese troops landed in Korea at Fusan, Wonsan and Chemulpo. Seoul occupied.
Aug. 26.—Treaty of alliance concluded between Japan and Korea.	Feb. 28.—Treaty of alliance concluded between Japan and Korea.
Sept. 15. — Chinese defeated in a hard fought battle at Ping-Yang, Korea, and retreated to the Yalu River, followed by the Japanese, who fortified Wiju.	March 5. — Skirmish at Ping-Yang. Russians retreated to the Yalu River, followed by the Japanese, who fortified Wiju.
Sept. 15.—Naval battle at the mouth of the Yalu. Chinese: 8 battle ships, 4 cruisers, 4 torpedo boats. Japanese: 9 cruisers, 5 torpedo boats. Eight Chinese vessels sunk or disabled. No Japanese ships disabled.	
Oct. 25.—The Japanese crossed the Yalu, attacked the Chinese left flank by fording the Ai River, and carried the hights of Kulien-Cheng. The Chinese retreated to Feng-Wang-Cheng.	May 1.—The Japanese crossed the Yalu, attacked the Russian left flank by fording the Ai River, and carried the hights of Kulien-Cheng. The Russians retreated to Feng-Wang-Cheng.
Oct. 28.—The Japanese reached Feng-Wang-Cheng. The Chinese retreated without a fight toward Mukden and fortified the pass of Mao-Tien. Feng-Wang-Cheng was made the base of operations, and troops sent westward by three roads. One division sent to Takushan.	May 6.—The Japanese reached Feng-Wang-Cheng. The Russians retreated without a fight toward Mukden and fortified the pass of Mao-Tien. Feng-Wang-Cheng was made the base of operations, and troops sent westward by three roads. Takushan occupied from the sea.
Nov. 11. — General Nodzu marched from Takushan to Siuyen and defeated the Chinese, who retired to Hai-Cheng.	June 8. — General Nodzu marched from Takushan to Siuyen and defeated the Russians, who retired to Hai-Cheng.
Oct. 26. — Japanese army landed without opposition on the east coast of the Liao-Tung peninsula, near Pitse-Wu.	May 6. — Japanese landed without opposition on the east and west coasts of the Liao-Tung peninsula, near Pitse-Wu and Port Adams.
Nov. 4. — Japanese army marched south and captured Kin-Chau neck after feeble resistance by 1,500 Chinese.	May 26. — Japanese army marched south and captured Kin-Chau neck after a fierce battle. The Japanese lost 3,500 men.
Nov. 5.—Talienwan was taken. Japanese troops advanced toward Port Arthur and besieged it.	May 27.—Talienwan was taken, and Dalny a few days later. Japanese troops advanced toward Port Arthur and besieged it.
Nov. 22.—Port Arthur captured by a double attack by sea and land.	
The Japanese landed at Kin-Chau, at the head of the Gulf of Liao-Tung, and advanced to Hai-Cheng, where a decisive battle was fought Dec. 19.	The Japanese advanced north up the Liao-Tung peninsula, defeated the Russians at Wafang-Kao, and concentrated around Hai-Cheng.

Jan. 30, 1895.—The Chinese opened peace negotiations.

Feb. 14.—Wei-Hai Wei captured.

March 4.—Niuchwang captured.

April 17.—Treaty of peace signed at Shimonoseki.

Court Room Christianity

THE contention of Protestants that there is danger in using images in worship because of the tendency, altogether too strong in all of us, but especially strong in the ignorant, to confuse the symbol with the spiritual conception for which it stands, has always been denied by Catholics, but it receives some confirmation from recent scenes in the French courts, from which the crucifixes have been removed. In several places the witnesses have objected that it was impossible for them to take the oath to tell the truth "before God and man" because there was no pictorial representation of Christ in the room. In some courts the judge has satisfied them by giving a lesson in the elements of faith, explaining that to the good Catholic God was everywhere. In other cases their scruples could not be so removed, and a small crucifix had to be produced upon which they could take the oath.

That this materialistic superstition is not confined to the unlearned is shown by a recent case before the Assize Court at Versailles, wherein M. J. Bonzon, counsel for the defense, demanded the release of his client on the ground that the oaths taken by jurymen and witnesses were invalid since no image of the divinity appeared in the court room. A Catholic, who had sworn before God to tell the truth, was not bound by this oath unless a crucifix was used, for in the Catholic Church the image of Christ is essential, and "the crucifix is the necessary intermediary between God and the faithful." The court rejected this ingenious plea.

There were more or less plausible reasons given for the suppression of the Congregations and their schools in France, altho they did not convince us; but it is much harder to justify the law which requires the crosses and religious pictures to be removed from the French courts of justice. We do not have them in our courts, and we do right; but it does not follow that they should be removed there. The Congregations were with much justice charged with teaching disloyalty. They were also concentrating an immense amount of wealth, and carrying on large businesses on the labor of celibates, with which other people could not compete. Their very celibacy, imposed by irrevocable vow, was with considerable reason said to be a wrong to society and the state. But a cross in a court room teaches no treason, amasses no wealth, underbids no labor, vows no celibacy. To be sure it is a religious emblem against which, in a Government institution, a Jew has the right to complain. But in the country districts there are no Jews to complain; the people are all Catholics, and they bitterly resent the removal of the emblems of their faith from the walls where they have stood for ages. The fact that France does not pretend to separate Church and State makes it consistent to put emblems of faith in public buildings. Especially is it of use in courts; for the people ask, How can we take oath in the presence of God if the divine symbol is removed? France ought to denounce the Concordat, abolish her subventions to religion, and then grant full liberty to all religions to preach, teach and do alms at their own expense and in perfect freedom. So long as the state is mixed up with religion she is sure to be in trouble. But in such a case as these crosses and crucifixes and paintings things should be left as they are until people begin to complain that their consciences are insulted. The case is much like that of the reading of the Bible in our public schools. The practice began when everybody wanted it, and where the people want it retained this has been properly done, even if the practice of a religious service in the public school is against the theory of our Government.

While on the subject of judicial oaths we take this occasion to protest against the relic of medievalism, which still prevails even in some parts of the country, the kissing of the Bible. This disgusting and irreverent custom has no justification in either religion or public policy. It may be necessary to keep in the court

room Bibles, such as are advertised "with aseptic washable covers," for the benefit of occasional bibliolaters, just as we bring in a chicken to be decapitated by a Chinaman taking the oath; but the ordinary Christian is neither a materialist nor a fetish worshiper, and should not be expected publicly to proclaim himself to be something of both by taking a corporal oath.

It would even do no harm if some of our modern preachers should read to their people next Sunday the sermon which St. Chrysostom preached to the people of Antioch, containing the passage:

"But do thou, if thou heedest nothing else, at least reverence the very book thou holdest forth to be sworn by, and open the Gospel thou takest in thy hands to administer the oath, and, hearing what Christ therein saith of oaths, tremble and desist." "If thou believest that the man is true, do not impose the obligation of the oath; but if thou knowest him to be a liar, do not force him to commit perjury."

Audubon Work

ALMOST every State in the Union has been busy of late on bird legislation. A summary of this gives us a very picturesque view of what people will undertake to do who are only half educated. Our legislators are pretty fairly well awake to the fact that the destruction of birds, which has gone on in the United States, has been an enormous blunder. Farmers are beginning to comprehend the fact that the very birds which they have been most troubled with are the ones that they cannot get along without.

There is, however, a feature of this legislation, in several of the States, against which we protest. In Massachusetts there has been a struggle to enact a bill to protect hawks and owls. Virginia has had such a law, but has given it up—and, we believe, very wisely. Whatever can be said in favor of the owls in some sections of the country, we believe that nothing can be said judiciously in favor of hawks, crows and blackbirds. There must not be too much of the sentimental and benevolent mixed in with this study of the bird question. The simple fact is that our whole republic of song birds hates the crow and hates the hawk. Robins, tanagers, catbirds, king birds and a dozen more will quickly unite to fight a crow that enters their neighborhood. The sentiment in favor of such birds originates with our Department of Agriculture, and Stations, which send out bulletins declaring that, "after analyzing fifty crow stomachs," nothing has been found except mice, crickets, etc. The same whitewashing reports are sent out for hawks and owls. Nobody undertakes to assert that every crow in the world breaks up a robin's nest, but every crow that gets a chance to do it does it. If our biological reporters should get the right crow they would find the baby robin in his stomach. We have seen these black fellows, time and again, perched on the edge of a nest, and studying the contents, to select the juiciest and sweetest for dinner. Hawks will do the same business. It is utterly impossible about our rural homes to create a bird paradise, if these marauders are to be protected by law. We rather agree with the State of Rhode Island, that has placed a bounty on crows, hawks and owls, notwithstanding the protests of several sportsmen's clubs and, we are sorry to say, the Audubon Society. We repeat that the sympathy extended by these societies is probably genuine, but mistaken.

The progress made in other directions is, however, exceedingly encouraging. In New York State the effort to repeal the law that forbade spring shooting of water fowl was defeated. This is a grand achievement, for the Long Island waters are a great resting place for water fowl during their northern migration. By the present law they are protected there, after the first of January. Maine has a law protecting eider ducks, of which there are probably not one hundred pairs left in that State. Yet it is said that the law is being violated, and a probable extinction of this glorious bird will result. The biggest fight of the year took place in New Jersey, where two separate bills, in succession, permitting the killing of robins, were defeated. The fact is the robin may be a pest, but he will be such only where man is either stupid or ignorant. He is a good judge of cherries, and takes a decent share of berries. The remedy is a simple one; let the people plant cherries as freely in proportion as they grew wild before man cut them, and the robin will

get all he wants, and his dinners will not be noted. The fact is we cannot have bird allies without we count them into the family and prepare for their food It is easily possible for any one to grow more wild cherries about his fences, or cultivated sorts, either; to plant Tartarian honeysuckle hedges and windbreaks of mountain ash. These are loaded with bird food and are especially relished by the robins. Those who advocate killing the robin are mostly people who have never undertaken to pay him the least amount of compensation for the good that he does.

New Jersey has endeavored to pass a bill protecting pigeons, but never could get it through until Governor Murphy called a special session to enact a pigeon bill. It is a curious state of affairs when public opinion must apply special pressure in such a cause, and succeed. In this case it did succeed. In Ohio, on the contrary, a bill was passed permitting the destruction of the wild dove—one of the most beautiful and one of the most useful birds in the State. In Mississippi a bill was passed, which has been held by the Audubon Society to be a model, or "the model," and in most of the Southern States the fight is on to protect our Northern birds while there for their winter season. If any one wishes to know what has become of his pet robins, catbirds and red-eyes vireos, he will probably find that they have been in the stewpots of New Orleans.

The work certainly is, on the whole, very favorable for the farmer and for general agriculture. As THE INDEPENDENT has said before, it is utterly impossible for us to adopt intensive farming without the alliance of our feathered friends. Let this be taught in our schools and let it be understood in our colleges, and in all other ways, until public sentiment is educated and public opinion aroused for the protection of the birds.

George Frederick Watts

In the passing of George Frederick Watts, who died on July 1st, England has lost her foremost artist and at the same time almost the last of the great leaders of the Victorian era. Indeed, of all the great ones of that age, he was the most thoroughly typical of his time. Among artists Watts was conspicuous for thought. He was a painter of ideas. Throughout his long life, whether he painted a portrait, or an allegory, or an historical fresco, or sculptured in marble a colossal figure, his constant endeavor was the search for a universal symbolism. He worked to produce art that should still be intelligible if it survived everything else of his time. He was not always or wholly successful in his quest, but the best of his creations are in the grand style of the masters and possess enduring qualities. He dared more than any allegorical painter who ever lived before him, and such pictures as "Love and Life," "Love and Death," "Time, Death and Judgment," "Hope," "Mammon," "The Court of Death," "Time, the Destroyer," and their companions are great and noble masterpieces which will have their message for the beholder as long as picture and beholder shall last. If Watts had never put on canvas any of these superb conceptions he would yet be accounted one of the greatest artists of his time for his wonderful series of portraits of eminent contemporaries—the most remarkable series of the kind ever made by any painter. They are wonderful—soul portraits, the best of them, which limn the character of the sitter and save for posterity the real appearance of the man more satisfactorily than the best of photographs. Yet in these portraits, in his allegories, in his illustrations of old legends, Watts never quite gained absolute mastery of technic. His line was seldom virile, not always sure. His color was never rich. His brush-work lacked sturdiness. He seemed to be too much preoccupied with his great thoughts to have time for perfecting the method of their presentation. Watts was born in 1817, thus belonging to a generation that antedated the pre-Raphaelite and later movements which had a transforming influence on modern art. He saw various "schools" of painting rise and fall, and he went quietly on his way unaffected by the passing fashion of the hour. The Royal Academy, which refused to admit him to membership until after he was fifty years old, would have made him its president when Lord Leighton died had not his age and uncertain health forbid. He lived an ideal life in seclusion and content. Never

of robust health, his productiveness was amazing. His life was a protest against commercialism and dillettantism. He stood for the social value of art. He sold only enough of his work to supply his needs. Most of the best of it he gave to the British nation. One of his great pictures, "Love and Life," he presented to the United States Government, and its acceptance and hanging in the White House a few years ago stirred up a silly tempest among the well-meaning but misguided members of the Woman's Christian Temperance Union, which caused a former President to banish it to subterranean darkness. Mr. Roosevelt, to his lasting credit be it said, has restored the picture to a place of honor in the Executive Mansion.

A National Scandal

For the good of the steamboat inspection service and the protection of passengers there should be not only indictments and prosecutions, but also removals from office. Everybody knows that the official inspection of the "General Slocum" was a farce. The inspector who pretended to inspect knows it. He declined to testify before the coroner's jury, on the ground that if he should do so he might incriminate himself! But when Secretary Cortelyou, of whose Department the inspection service is a part, ordered a prompt reinspection of the passenger boats in New York harbor, the officer in charge at New York remarked coolly that the work of his bureau was "governed entirely by acts of Congress." Such an order would not be executed without his knowledge, he added, and he "inferred" that the work of reinspection had not been begun. This officer was not long ago at the head of the service in Washington. Because he was believed to be incompetent or incapacitated by old age he was removed from that place. Immediately thereafter he was placed in charge of the service at our greatest port! If the 1,000 victims of the "Slocum" disaster could speak, some of them might ask by what kind of a "pull" he was able to remain in the service. Another officer at New York, when asked whether the excursion boats in the harbor would be reinspected, replied that they would not, because they had been inspected and had been found to be meeting the requirements of the law. The inspection of which he spoke was made when the "Slocum" was inspected, in May last. This great loss of life in the East River has disclosed a national scandal. The present head of the service, General Uhler, declares that the law is made impotent by the remission of fines at the request of politicians. Such favors were not in accord with the policy of Mr. Armstrong, Assistant Secretary of the Treasury, who, we have reason to know, wrote as follows to a Senator of the United States, who had asked him to remit a fine:

> "In view of the several thousand vessels whose inspection certificates are the only guaranty of safety that the traveling public has, I find it necessary to insist upon a vigorous enforcement of the law, that I may not some day waken to realize that, directly or indirectly, I have been responsible, through laxity in the enforcement of penalties, for some terrible loss of life."

The service ought promptly to be reorganized and reformed by removals and new appointments. Will the Federal Government retain in office the worthless inspectors who gave the "Slocum" a certificate, as Tammany has retained Building Inspector French, who had overlooked the glaring defects in the Darlington Hotel, where 20 workmen were killed, and whom a grand jury denounced as "grossly negligent and unfit," recommending his "immediate dismissal?"

The Democratic Convention

The strength and influence of the conservative element of the Democratic party have been very noticeable in many recent conferences and State conventions, and are to be seen now at St. Louis, where the delegates have assembled to make a ticket and a platform. We are writing just before the opening of the national convention. This conservatism or caution, exhibited in the preliminary work, is due in part to the return of Gold Democrats and in part to the teachings of repeated defeat. The party has recovered a considerable portion of the brains that it lost in 1896 and 1900; and many of its politicians who threw up

their hats for Bryan in those years are now convinced that there will be more political profit in throwing hats up for another kind of candidate. Their conversion or enlightenment has been caused not only by the emptiness of two consecutive failures, but also by the continual and forcible exhortation of the Gold Democratic press. A Democratic convention that appears to be controlled by conservative influences may be swept off its feet by some unforeseen radical movement or appeal, it is true, but at the present time the nomination of a conservative candidate appears to be assured—a candidate acceptable not only to Gold Democrats, but also to all others, except Mr. Bryan and the small minority that he controls. Those who ask for a gold standard platform cannot really expect to get it. Of course, that is asking too much. But they will be satisfied, we presume, if Mr. Williams's ingenious evasion of the currency standard problem is accepted. Several old hands will be at work in the room of the platform committee, and the result of their joint, and sometimes inharmonious, labors cannot be foreseen; but Mr. Williams has a platform that in some parts is made with much skill, and we shall be surprised if a considerable portion of it is not adopted as the party creed. There has been more than the average supply of tact and common sense in this Mr. Williams; of course, he may part with some of it at St. Louis. A newspaper canvass showing that more than half the delegates are hostile to the suggested nomination of Mr. Cleveland appears to remove him from the list of possibilities. Perhaps it has occurred to a politician here and there, however, that the persistent suggestion, and all the talk about a strong undercurrent for the ex-President, have not been wholly without profit to the cause of Judge Parker in the South and West.

The Atlantic Steamship Trust

There still may be some whose opinions as to the origin and purpose of the International Mercantile Marine Company (or Atlantic Steamship Trust) need to be revised. They will observe that Mr. J. Bruce Ismay, formerly the head of the White Star Line, has been "invested with absolute authority in the management of the company," that the voting trustees have "handed over to him all executive powers," and that all the work of the combination, including repairs as well as the building of ships, is now done in Great Britain. In the light of these facts, as stated by Mr. Ismay, and of the agreement made with the British Government, we fail to see that anything has been accomplished for American shipping interests and American commerce on the seas by this combination. Indeed, the whole outfit, American ships included, appears to be definitely under British control. We fear that in this case, as in the making of certain other combinations, the ruling motive was neither patriotism nor a determination to promote and extend American commerce, incredible as this may seem to some, but a sordid desire for pecuniary profit. As the shares are quoted at $3½ for the common, and $16½ for the preferred, the greater part of the profit appears to have been taken by the White Star Company.

Better than Chain-Gang

When white men and colored work together in sympathy for the reclamation of negro children arrested for vagrancy or crime we may hope for a good result. A very interesting experiment of this sort is in progress in Birmingham, Ala. Judge Feagin, an old Confederate soldier, was greatly disturbed by the evil results that were bound to come from sentencing negro boys brought a second time to his court to the chain-gang, where they must associate with hardened offenders. So he devised the plan of offering them the choice of the chain-gang or of being bound out to some negro farmer of good character, who promises to "raise and educate them, to give them a good home, and train them in habits of industry and good citizenship," to treat them kindly, and report to Judge Feagin once a month. Within three months 23 boys have gladly accepted the offer. Besides this Judge

Feagin has inaugurated a probation system, supported by the better colored people, and 175 boys are under its care. One negro of means has given 125 acres of land to Judge Feagin to be used for this philanthropic work, and now the leading colored people have formed an association to co-operate with this work and organize a reform school to train wayward colored boys and girls. Such effort and co-operation afford the highest hope of useful results, and show that mutual helpfulness will solve any racial question.

In an issue a few weeks ago we published an article on Mr. Duncan's missionary work in Metlahkatla and Alaska. We have received a letter from Eugene Stock, editor of the publications of the Church Missionary Society of England, the largest missionary society in the world, in which he points out certain errors in that article. It is not true, says Mr. Stock, that the Society "insisted upon its elaborate ritual being introduced into the Indian services." The Society is famous for the simplicity of its services, which have nothing of the ritualistic about them. The article states that the Society insisted of fermented wine at the Lord's Supper. No such order was ever given, only the order that the Lord's Supper should be celebrated, which Mr. Duncan refused to do in any form, and this was the cause why Bishop Ridley was sent out, and Mr. Duncan seceded and, later, went over to the United States territory on account of the intervention of the Canadian Government in a dispute of his Indians with the provincial government. Mr. Stock speaks warmly of the good work which Mr. Duncan has done.

In the course of its inquiries concerning subsidies and other devices for the relief of American shipping, the Merchant Marine Commission was told at Cleveland by Vice-President Wallace, of the American Shipbuilding Company, that the United States Steel Company, as he had been informed by that corporation's sales-agent, has been selling to shipbuilders at Belfast, for $24 per ton, delivered at that port, steel for ships that is sold to our own shipbuilders at $32, delivered at the mill in Pennsylvania. This throws some light upon the causes of the lower cost of construction abroad, and we are not surprised that Senator Gallinger called such discrimination "an outrage." He should inquire whether the tariff on such steel is really needed for the manufacturers' protection.

The attitude of old conservatism to new truth is admirably illustrated in a story which has clearly not a bit of theological or sociological character. In the memorials of the life of Miss Caroline Fox it is told that on one occasion the great Irish mathematician, Sir W. Rowan Hamilton, met Sir G. Airy, then Astronomer Royal, at Miss Fox's residence. He had just published his famous discovery of quaternions, and was explaining its principle to Airy. After a short time Airy said, "I cannot see it at all." Hamilton replied, "I have been investigating the matter closely for many months and am certain of its truth." "Oh," rejoined Airy, "I have been thinking over it for the last two or three minutes, and there is nothing in it."

The Presbyterian Church reports during the past year show an increase of 22,000 members, which compared with the total of last year, 1,067,000, shows a growth of nearly 2 per cent., which really is not discouraging. Of this growth, one-quarter was in the Presbyterian stronghold of Pennsylvania, while the small losses were in the South, where Northern Presbyterian has a hard task to live and grow.

America is not the only country where foreign plays have to be made over to suit the popular taste and sentiments. At Hamburg it was found necessary to make a slight change in the ending of Ibsen's "Doll's House." That is, Nora remains with her husband and children instead of going away. In Italy she is made to kneel devoutly before a Madonna in the last scene.

What a mass of corruption has been uncovered by these latest confessions to Prosecutor Folk! St. Louis really cannot afford to have him elected Governor.

Insurance

The Yale Course in Insurance

THE course of instruction in insurance offered at Yale University for the first time during the past year will be repeated during the academic year 1904-5. On the basis of this first year's experience, the course will be somewhat changed as regards the methods of instruction. The absence of a proper textbook made it necessary to rely largely upon a series of carefully prepared lectures, delivered by insurance experts, such as John K. Gore, John M. Holcombe, John F. Dryden, John A. McCall, James W. Alexander, S. C. Dunham, R. M. Bissell, John B. Lunger, all connected with leading insurance companies. These lectures are about to be published in book form, thus supplying the need of a textbook. Oral instruction has heretofore been pushed into the background. Hereafter, the bulk of the instruction will be of that kind, and will be conducted by a trained teacher, whose name cannot yet be announced. A few lectures will be delivered supplementary to the textbook instruction, and as heretofore, by prominent insurance men.

The scope of the course is the general nature and economic functions of insurance, especially life, fire and marine insurance; the history and statistics of the development of insurance; the theory of chances and its application to the calculation of insurance premiums. The course is primarily intended for undergraduate students of the college, who either wish a general knowledge of insurance as a means of culture or plan to enter the field professionally. Attendance at the lectures and other exercises of the course is open to the general public; and any, not students regularly enrolled in the university, can make arrangements to receive instruction in the course, on payment of a moderate fee.

The following examination questions will show the scope of the insurance course at Yale for the year just closing:

1. Describe the place that fire insurance occupies in present economic conditions, and mention some functions which it performs.

2. Give an outline of the history of fire insurance in England with description of the development of the methods employed.

3. (*a*) Define a fire insurance policy.

(*b*) How is it limited?

(*c*) What is a co-insurance clause, and for what purposes used?

4. (*a*) What are the strong and weak features of companies operating on the mutual plan?

(*b*) What are the advantages of stock company methods?

(*c*) Describe factory mutual companies. What are the limitations of this system of insurance?

5. (*a*) Describe, with diagram, the construction of the slow burning type, noting the material, hight, thickness of walls, beams, girders and floors. Also mention approved methods for installing elevator and stair shafts and of treating interior and exterior wall openings.

(*b*) Describe method of protecting property by automatic sprinklers, giving the most important requirements to be observed in installing such equipment.

6. (*a*) Describe the various classes or kinds of hazards to which a risk may be exposed.

(*b*) Describe the system of making rates by schedules.

(*c*) What are the advantages of the schedule system?

7. (*a*) Describe, with examples of each, the terms "general average" and "particular average" as used in marine insurance, and how these terms came to be employed.

(*b*) Describe the purposes of steam boiler insurance.

(*c*) What is especially covered by contracts issued by steam boiler insurance companies?

8. (*a*) Give a history of accident insurance, and tell what the ordinary accident insurance contract covers.

(*b*) Describe the origin of life insurance in England and in the United States.

9. (*a*) Explain the Law of Negligence as recognized by the English Common Law.

(*b*) How did compensation for death creep into the statutes of the different States?

(*c*) Compare personal accident insurance with liability insurance.

10. (*a*) Describe the German system of compulsory insurance.

(*b*) Comment on its effect on society and especially on individuals covered.

It would be interesting to know how many insurance brokers could pass such an examination.

A DECISION was lately rendered at Boston, Mass., which shows the legal value of an eye. In the suit of Bessie Dresser against the N. Y., N. H. & Hartford R. R. to recover for the loss of an eye, while traveling upon one of the defendant company's trains, a verdict was secured for $18,500.

Financial

Fiscal Year Accounts

SECRETARY SHAW'S estimate in December last was that the accounts of the fiscal year would show a surplus of $14,000,000. At the end of the year (June 30th) there was disclosed a surplus of $13,247,000, if the unforeseen payment of $50,000,000 for the Panama Canal and the loan of $4,600,000 to the St. Louis Exposition were excluded. It is expected that the loan will be repaid. If the $50,000,000 be counted in with the year's expenditures, there is shown a deficit of $36,000,000 instead of a surplus of $13,247,000, about $2,000,000 of which appears to have been procured by withholding temporarily the greater part of the customary payments on the last day of June.

The year's receipts, $541,186,000, were less by $17,500,000 than those of 1903. Small increases of internal and miscellaneous revenue were overcome by a decrease of nearly $22,000,000 in customs receipts, due to changed conditions which have affected the demand for imported goods. Expenditures (including $54,600,000 for Panama and St. Louis) were $582,539,000. If the $54,600,000 be excluded, there was still an increase of nearly $22,000,000 over last year's outgo. For the navy $20,000,000 was added; for pensions $4,000,000, and for the civil and miscellaneous account $7,000,000. These additions were partly met by the following decreases: War Department, $3,000,000; Indians, $2,500,000; interest, $4,000,000.

JUDGE LANNING, at Trenton, has signed a final decree ordering a sale of the property of the United States Shipbuilding Company (Shipyard Trust) in the foreclosure proceedings instituted by the Mercantile Trust Company and the New York Security & Trust Company on the two mortgages ($15,000,000 and $10,000,000) held by them. The minimum prices which the Receiver is authorized to accept amount in the aggregate to $11,100,000, including $7,500,000 for 300,000 shares of the Bethlehem Steel Company and $1,400,000 for the Union Iron Works in California.

....The Brooklyn Trust Company, of which Theodore F. Miller is President, as shown by the June 30th statement, has a total resource of $18,180,754, and undivided profits of $1,939,370. The capital stock is $1,000,000. The Executive Committee, of which Francis L. Hine, Vice-President of the First National Bank of this city, is chairman, includes such well-known gentlemen as Thomas T. Barr, Samuel W. Boocock, Frank Lyman, Charles A. Schieren, Alexander M. White and Theodore F. Miller.

....Vermilye & Co., Harvey Fisk & Sons, J. P. Morgan & Co., and other well known banking houses, together with prominent banks, have signed and made public an agreement that they will pay for and receive State, County and City bonds " with interest figured on the basis of 360 days to the year, months and days, this being the basis on which interest is paid by all municipalities, and that they will maintain this system under any and all circumstances."

....Owing to the retirement of Henry S. Kerr, the banking house of Redmond, Kerr & Co. becomes Redmond & Co. Besides Henry S. Redmond, O. J. Thomen, James C. Bishop, a son of the late Heber R. Bishop, and William R. Cross, formerly of the firm of Morton, Bliss & Co. and more recently treasurer of the Morton Trust Company.

....Dividends announced:

Electric Storage Battery Co., Philadelphia, Common and Preferred, 1¼ per cent., payable July 1st.

American Savings Bank, 3½ per cent., payable July 18th.

Franklin Savings Bank, 3½ per cent., payable July 18th.

Greenwich Savings Bank, 3½ per cent., payable July 18th.

People's Bank, 5 per cent., payable July 1st.

Mechanics & Traders' Bank, 4 per cent, payable July 1st.

Excelsior Savings Bank, 3½ per cent., payable July 18th.

Amer. Car & F'dry Co., Preferred, 1¾ per cent., payable August 1st.

Eagle Savings & Loan Co., 4 per cent. and 5 per cent. (see advt.).

The Independent

Vol. LVII NEW YORK, THURSDAY, JULY 14, 1904 No. 2902

Survey of the World

Work of the Democrats at St. Louis

The Democratic convention at St. Louis was one of the most remarkable meetings of this kind in the history of American politics. Before the first day's session it could be seen that Judge Parker would be nominated, altho Tammany insisted that he could never get the required two-thirds of the delegates, and Mr. Bryan asserted that more than one-third of them would support him in whatever course he should decide to take. The Judge's nomination was made a foregone conclusion by the almost unanimous decision of the Pennsylvania delegation, on the night of the 4th, to vote for him; and on the night of the 6th ex-Senator Hill predicted a victory for his candidate on the first ballot. The feature of the first day (Wednesday) was a very long address by John Sharp Williams, temporary chairman, mainly given up to criticism of ex-Secretary Root's opening address at the Republican convention. Mr. Williams asserted that Mr. Cleveland's Democratic Administration and the Democrats in Congress practically established the gold standard by repealing the Silver Purchase law. The gold basis, he said, was an accomplished fact, accomplished "by the dogged persistency and indomitable will of Grover Cleveland." By the applause with which this utterance was received, and an apparent disregard for Mr. Bryan in the convention, the advocates of a gold platform were encouraged. On Thursday little was done. A subcommittee had agreed upon a platform (mainly upon the lines of the one prepared by Mr. Williams) and had reported it to the full committee, in which a bitter contest was then begun. The subcommittee's platform (adopted by a vote of 7 to 3) contained the substance of Mr. Williams's reference to the increase of the supply of gold during the last eight years as warranting an abandonment of the old silver issue. Mr. Bryan chose to make his first fight in behalf of the rejected Harrison delegates in Illinois. The political comment was that as he had a pretty good case he hoped by the vote to show that more than one-third of the delegates were standing with him. But his eloquence was unavailing, and, on the anniversary of his "cross of gold" speech in 1896, he was beaten by a vote of 647 to 299. Whereupon the Gold Democratic journals began to talk of the "passing of Bryan." After the platform was made some of them admitted that he had not "passed." All that night the platform committee was at work. In no previous convention had there been so great a contest as was seen in the room of this committee before an agreement was reached. On Friday morning a brief session was held. The platform was not ready. To kill time a few speeches were made, and in one of these Richmond P. Hobson (the hero of the "Merrimac") led some to liken him to the Rev. Dr. Burchard, by remarking that "the only President who had ever enforced the laws against a labor union was a Democrat." That morning the platform committee decided by a vote of 35 to 15 to say nothing whatever in the platform about the currency question. But the formal report was deferred until 8 p.m. At the evening session the platform was read, but the tumult was so great that very few persons heard it. Immediately the previous question was

ordered, and in four minutes the platform was accepted, without debate and with only 2 negative votes. Then came the nominations. Judge Parker's name was presented by Martin W. Littleton, of Brooklyn, Senator Carmack and many others. The applause at the first mention of this candidate continued for 31 minutes. Mr. Hearst was nominated by E. M. Delmas, of California, and several delegates from other States. In this case also the duration of the applause was 31 minutes. Judge Gray and others were nominated. Mr. Bryan spoke with much force against the selection of any one representing the gold and capitalistic interests, suggesting as available men Mr. Hearst and ex-Governor Pattison, of Pennsylvania, but finally (for Nebraska) seconding the nomination of Senator Cockrell. After the first day Mr. Bryan was by no means disregarded by the great audience or treated with coldness. There was only one roll call. On the first ballot Judge Parker had 658 votes (almost enough); Mr. Hearst, 204; Senator Cockrell, 42; Mr. Olney, 38; Mr. Wall, 27; Judge Gray, 8; Mr. Williams, of Illinois, 8; Mayor McClellan, 3; General Miles, 3; ex-Senator Towne, 2; Senator Gorman, 2; ex-Governor Pattison, 1, and Bird S. Coler, 1. Before the result was announced several small delegations shifted their votes to Judge Parker's list. Others speedily followed, and upon the motion of Governor Dockery, of Missouri, the nomination of Judge Parker was made unanimous. The weary convention was then adjourned until 2 p.m., when it was to complete the ticket.

Judge Parker for the Gold Standard

During the afternoon there were conferences concerning the selection of a candidate for second place. Ex-Senator Turner, of Washington, had been laid aside, owing to his record as a Republican in the South. Judge Harmon's name was withdrawn. It was said that Judge Parker preferred ex-Senator Henry G. Davis, of West Virginia, a cousin of Senator Gorman and the father-in-law of Stephen B. Elkins. It was while the nominating speeches were being made, Saturday evening, that news of an important telegram from Judge Parker began to excite comment. On account of this message the proceedings were interrupted by a recess. The telegram, addressed to William F. Sheehan, one of Judge Parker's most prominent representatives, was as follows:

"ESOPUS, N. Y., July 9th, 1904.

"I regard the gold standard as firmly and irrevocably established, and shall act accordingly if the action of the convention to-day shall be ratified by the people. As the platform is silent on the subject, my view should be made known to the convention; and if it is proved to be unsatisfactory to the majority, I request you to decline the nomination for me at once, so that another may be nominated before adjournment. ALTON B. PARKER."

At first certain prominent Democrats from the South were angry and declared that their delegations ought to be withdrawn from Judge Parker's list of votes. Complaint was made that they had been misled by ex-Senator Hill. At a conference it was decided that the platform should not be changed, but that the convention should be asked to approve the following reply to Judge Parker's message:

"The platform adopted by this convention is silent on the question of the monetary standard because it is not regarded by us as a possible issue in this campaign, and only campaign issues were mentioned in the platform. Therefore there is nothing in the views expressed by you in the telegram just received which would preclude a man entertaining them from accepting a nomination on said platform."

After the recess this reply was laid before the convention and supported by John Sharp Williams, Senator Daniel and others, Senator Tillman making the longest argument. His anger had cooled, and he pleaded for harmony. Mr. Bryan, who had been ill, unexpectedly came in and spoke at length against sending the reply, saying that there was nothing in the platform to prevent Judge Parker from accepting the nomination. If the answer should be sent, he proposed amendments asking Judge Parker to say what he, if elected, would do with respect to silver dollars, asset currency, etc. But he was induced to withdraw these amendments, and, at a little before one o'clock on Sunday morning the proposed reply to Judge Parker's telegram was ap-

proved by a vote of 774 to 191. A few minutes later ex-Senator Henry G. Davis, of West Virginia, was nominated by acclamation for Vice-President, and the convention was at an end. Mr. Davis reached the age of 80 years in November last.

The Democratic Platform

In the long, all-night sessions of the platform committee many bitter words were said. The subcommittee, by a vote of 7 to 3, had prepared a platform containing the following paragraph about the currency standards:

"The discoveries of gold within the past few years, and the great increase in the production thereof, adding $2,000,000,000 to the world's supply, of which $700,000,000 falls to the share of the United States, have contributed to the maintenance of a money standard of value no longer open to question, removing that issue from the field of political contention."

These are the words that the full committee excluded by a vote of 35 to 15. They appear to have been thrown out to prevent the insertion of paragraphs in favor of an income tax, government ownership of public utilities, etc., which were pressed forward by Mr. Bryan, to assist him in his movement against gold. Senator Daniel, formerly for silver, now for gold, sharply reproved Bryan, questioning the propriety of attempts at dictation from a twice-defeated candidate who was reviling every man proposed for the Presidential nomination. Bryan was successful not only in excluding the money paragraph, but also in modifying the paragraphs about Trusts and the tariff. The platform finally adopted denounces protection as a robbery of the many to enrich the few, and favors "a revision and a gradual reduction of the tariff by the friends of the masses and for the common weal, not by the friends of its abuses, its extortions and its discriminations." The subcommittee's (and Mr. Williams's) words, urging that due regard be paid to "existing conditions, however wrongfully or unjustly brought about," were rejected. Trusts are denounced; any such combination tending to destroy "individual equality of opportunity and free competition by controlling production, restricting competition or fixing prices, should be prohibited and punished by law." More power for the Interstate Commerce Commission is demanded. Mr. Bryan secured by a vote of 23 to 20 the insertion of the paragraph calling for laws to exclude from interstate commerce any Trust or combination that monopolizes any branch of business or production. Our summary must be brief. The original labor paragraph is of no special importance; there was added an attack upon the course recently taken by the Government of Colorado. The platform calls for a reduction of the army, the extermination of polygamy, "liberal trade arrangements" with Canada and other countries, generous pensions by legislation, the direct election of Senators, the just and impartial enforcement of the principles of civil service reform, and such treatment for the Philippines as Cuba has received. It would raise Arizona, New Mexico and Oklahoma to the rank of States and give Porto Rico a Territorial form of government. It opposes subsidies for shipping, and deplores the "selfish and narrow spirit" of the Republican convention, as shown by its attempt to "kindle anew the embers of racial and sectional strife." The subcommittee's paragraph favoring "the maintenance and a liberal annual increase of the navy" was rejected.

Populists and Socialists

At a national convention in Springfield, Ill., attended by about 200 delegates, the Populist party (now including the Middle-of-the-Road faction) nominated Thomas E. Watson, of Georgia, for President, and Thomas E. Tibbles, of Nebraska, for Vice-President. The platform, upholding the familiar Populist doctrines concerning the currency, calls for Government ownership of railroads, telegraphs and telephones, the abolition of child labor and sweatshops, an eight-hour day in factories and mines, new laws for the regulation of Trusts and railroads, legal provision for the initiative and referendum, and a direct vote for all public officers, with right of recall. —The Socialist Labor party, at its national convention, nominated a ticket—Charles H. Corregan, of New York, a printer, for President, and William W. Cox, an Illinois coal miner, for Vice-President. Approval of the miners' strike in Colorado was withheld for the

reason, it is said, that the miners' union is affiliated with the Social Democratic (now Socialist) party. The "brand of unions" represented by President Gompers, of the Federation of Labor, was opposed. Mr. Gompers himself, the American Federation, and the Civic Federation were denounced as "adjuncts of capitalism."

Inspection of Steamships

Eighteen inspectors, who have been on duty at other ports, began, last week, at New York, the reinspection of passenger steamships that was recently ordered by Secretary Cortelyou. The local officers of the steamship inspection service, who certified to the good condition of the "Slocum," her life preservers, boats, etc., are not permitted to have anything to do with this new inspection, which is being made in the most thorough manner. On three barges which are used in carrying immigrants from ocean steamships to Ellis Island it was found that 700 life preservers which recently passed inspection had been destroyed, their places having been taken by as many new ones inspected and accepted since the burning of the "Slocum." Hundreds of defective life preservers on several other boats have already been rejected. It is shown that on a boat permitted to carry 1,825 passengers the lifeboats and life rafts, altho apparently sufficient in number to satisfy the law, could not accommodate more than 275 persons under the most favorable circumstances. The Commission appointed by Secretary Cortelyou to make an investigation concerning the "Slocum" will probably begin its work this week. Emperor William, of Germany, has asked for a list of those persons, especially the nurses on North Brother Island, who exhibited heroism in saving passengers from the "Slocum."—Survivors from the wrecked steamship "Norge," which was bound for New York with 748 immigrants, four-fifths of whom perished, say that many of the "Norge's" life preservers were worthless, like those on board the "Slocum." This foreign steamship was subject to our inspection laws, and had been inspected at New York in October last. It was asserted at first that the inspector who did the work was Henry Lundberg, who afterward accepted the "Slocum's" worthless preservers, rotten fire hose, etc.; but it now appears that the "Norge" was examined by Inspectors Ray and Walsh. Her crew, like that of the "Slocum," appears to have had no knowledge of emergency drills or of the proper handling of lifeboats. Her New York certificate allowed her to carry only 448 passengers, but she was on her way to this country with 748 on board. For all these there were only eight wooden boats and one life raft.

Colorado's Labor War

What General Bell calls the "fumigation" of the Cripple Creek mining district in Colorado has not yet been completed. Five of the deported miners recently returned to Victor. They were promptly arrested and escorted out of town by sheriff's deputies. At a point some miles from Victor they were taken from the deputies by a large party of masked men, who whipped them and warned them never to visit Victor again. According to the miners' story, these masked men were citizens who had an understanding with the deputies. At Victor the Citizens' Alliance recently demanded the resignation of F. P. Mannix, Recorder and Clerk of the county, saying that he must also go into exile. He refused either to resign or to go, but on the 9th he was glad to accept the protection of a military escort and depart. He believed his life was in danger. "There is no telling what would happen," said General Bell, "if Mannix remained in the district. Many of these men are almost mad, and would probably be guilty of foolish acts if occasion came up." W. H. Morgan, one of the first to be deported, president of a mining company and formerly an employer of union labor, has committed suicide in Denver. Two newspapers in that city, which have sharply criticised the action of the State Government, are said to be suffering from an advertising boycott imposed by the Citizens' Alliance and certain business interests. After having been confined for 103 days in the "bull pen" at Telluride and elsewhere, President Moyer, of the Western Federation of Miners, has been released on bail. He is under bonds to answer the charges of murder and inciting to riot.—There has been much disturbance in Syd-

ney, C. B., owing to assaults made by a mob of strikers upon non-union men employed in their places by the Dominion Iron and Steel Company. At last accounts it was expected that the British warship "Indefatigable," then on her way to that port, would land marines to assist the local police and militia.

Lynching Averted in New Jersey

There was much excitement in the vicinity of Mt. Holly, N. J., last week, where the lynching of three negroes guilty of an atrocious crime was with some difficulty prevented. The culprits—Aaron Timbers, William Austin and Jonas Simms—are now safe in jail and have confessed. Early on the morning of the 5th they waited near the house of a young farmer named Biddle until he had driven away with a load of milk cans. Then they entered the house, whose only occupants were the farmer's wife, Mrs. Elsie Biddle, and her infant child. Threatening her with revolvers, they compelled her to give up all the money she had, and then bound her, committing the crimes which, when known later in the day, so enraged the neighboring people that they all set out, with guns, to hunt the scoundrels down. While they were searching the woods and swamps—in which one or two innocent negroes were captured—one deputy sheriff unintentionally shot another, causing injuries that may prove fatal. Austin was caught in Philadelphia and Timbers and Simms in Columbia, Pa. If they had been found near the scene of the crime, they might not have been saved for trial. All three have told the whole story, making full admission of guilt. It appears that Timbers had already been confined in the Reformatory for several years as punishment for a similar assault. Some think that each one can be sent to prison for sixty years, if sentenced for each of the offenses committed. They may yet be tried for murder, for their unfortunate victim is so shaken in body and mind that her friends despair of her recovery. On the day following the assault, 5,000 persons assembled at the jail, many of them farmers carrying guns, and demanded two negroes who had been captured but not yet identified. They did not attempt to enforce their demand, and the two negroes, who were really innocent, were safely held. A special session of the grand jury has been ordered, and it is expected that the three guilty men will promptly be brought to trial.—William McLane, a negro who attacked two or three young women in New Haven, one of them the daughter of a Yale professor, has pleaded guilty and been sent to prison for seven years. Within the last two weeks five lynchings in the South have been reported, two in Mississippi and one in each of the States of Alabama, Georgia and South Carolina. In two instances the crime charged was the killing of a white man. At Eupora, Miss., a negro named Dunham, accused by four young women, one of whom placed the noose around his neck, asserted to the last that he was innocent.

The British Parliament

Mr. Chamberlain in an address at a dinner given by his friends in honor of his sixty-eighth birthday outlined his financial and imperialistic program and received the enthusiastic indorsement of the 200 members of the House of Commons there present. No member of the Government was there. Since more than half of the Unionists in the House are thus publicly pledged to his course, Mr. Chamberlain is to be considered the leader of the party in spite of the efforts of the Free-Traders to depose him. Mr. Chamberlain declared that he and his followers would loyally support the Balfour Government and maintain it in power as long as possible. Mr. Balfour carried through by a majority of 80 his closure proposal to facilitate the business of the session. The Opposition was bitter and violent, and never in the recent history of the House of Commons has there been seen such disorder in the lobbies. Winston Churchill attacked the Government and his former party, but was hooted down. Two nights later the Government made use of the closure in forcing through the Licensing bill, but the tumult was so great that Premier Balfour found it impossible to speak, his voice being drowned in cries of "Gag" from the minority. The Premier stated that under no circumstances will there be a dissolution of Parliament this year unless he should fail to receive the support of his colleagues. In the session of the 8th

Timothy M. Healy attacked the Irish leader, John E. Redmond, for selling his estate on the basis of 24½ years purchase. In reply to the epithet of "traitor," which was hurled at him by the other Irish members, he said that the Nationalists had honored him by turning him out of the party in December, 1900. Here the uproar was so great that he was unable to proceed and he left the room. The Alien Immigration bill has been abandoned by the Government for the present. The bill follows the recommendations of the report of the Royal Commission on Alien Immigration and is intended to exclude undesirable classes. The Liberals very strongly opposed the bill, as they considered it an Anti-Semite movement. At its second reading Sir Charles Dilke tried in vain to substitute for the bill more stringent measures against sweating. He spoke of the excellent qualities of the Hebrews and said Christian people ought to be anxious to offer the Jews an asylum as compensation for their past persecution. The House of Lords has decided that no change is to be made in the coronation oath, which requires on the part of the King specific denunciation of Roman Catholic beliefs. The Duke of Norfolk moved a resolution that the oath should be amended so as not to include a condemnation of doctrines forming a part of the conscientious beliefs of any of his Majesty's subjects. The Earl of Jersey moved to amend the resolution by adding that, while the House of Lords was desirous that no expressions unnecessarily offensive to any of his Majesty's subjects should be required of the sovereign, nothing should be done to weaken the security of the Protestant succession. The amendment was carried.

Austro-Hungarian Politics

A prominent member of the Independence party, Mr. Geza Polonyi, has raised an interesting question in the Hungarian Chamber by moving that the chamber extend its congratulations to the heir apparent, the Archduke Franz Ferdinand, on the birth of his second son, Alphonso. This seemingly innocent request carries with it very important implications in regard to the Austro-Hungarian succession and the possible separation of the two kingdoms, for the marriage of the Archduke with the Princess Hohenberg, *née* Countess Chotek, is a morganatic one and the issue of it legally disqualified from succeeding to the Austrian throne. But Hungarian law does not recognize morganatic marriages, consequently on the succession of Franz Ferdinand the Countess Chotek would become Queen of Hungary and her children inherit the Hungarian, tho not the Austrian, crown. Obviously the official recognition by the Hungarian Chamber of the birth of a son to the Archduke would imply its importance from a dynastic point of view and lead to endless complications. Consequently the Premier, Count Tisza, secured the rejection of the motion, tho in his reply to Mr. Polonyi he evaded the points involved and stated that the only object of the motion was to embarrass the Government and bring the heir-apparent into political fights.—Count Apponyi, leader of the national section of the Liberal party in the Hungarian Parliament, will visit St. Louis in September to take part in the International Parliamentary Congress, where he will urge the adoption of measures regulating and restricting the use of mines and torpedoes in naval warfare on the ground that the Russo-Japanese war had shown that these weapons were too barbarous and destructive and involved too much danger to neutral shipping. Count Apponyi recently delivered an address to his constituency at Jàsz-Berény, in which he outlined a bold program for the Hungarian party. He demands the external and visible differentiation of the King of Hungary from the Emperor of Austria by a special Hungarian flag and a separate court; the obligation of the sovereign, the heir-apparent and the diplomatic corps to reside for a definite part of the year on Hungarian soil; the affirmation of Hungarian autonomy before the world by treaties and by a separate consular and diplomatic service; the employment in the Hungarian army of the flag and language of that country and of national officers. Evidently the concessions recently obtained by the Independence party, tho far beyond what they had expected, have only served to whet their appetite for more.

The Russo-Japanese War

Both armies occupy nearly the same position as was reported in our last issue, tho General Kuroki has brought his forces nearer to the railroad all along the line and General Oku has advanced one step further north by the capture of Kai-Ping (Kai-Chau), at the head of the Liao Tung peninsula. A few hundred of General Samsonoff's Cossacks held this point and were only dislodged after a hard fight, with a loss of ten guns and 50 prisoners and 150 men killed and wounded. Among the killed was Count Nyrodt, a member of the General Staff. Lieutenant-General Sakaroff gives the following official report of the engagement:

"Our detachment remained during July 8th at Kai-Ping station, having its advance posts on the right bank of the Kantakhe River, the enemy occupying the hights on the left bank and fortifying themselves thereon.

"Our battery on the railroad bridge opened fire at the enemy's patrols which appeared in Kantakhe Village. Toward noon a fusillade occurred between a detachment of the enemy and our company, which observed the enemy retiring. Our losses were six wounded.

"Toward the evening of July 8th the enemy's force, consisting of four divisions and a brigade, could be made out in front of Kai-Ping, extending along the seashore. At dawn on July 9th the enemy resumed the offensive upon the rear guard of our detachment, which retired about 6:30 in the morning from Kai-Ping. The enemy's cavalry advanced slowly along the shore road to Ying-Kow [port of Niuchwang]."

General Oku's report is very different from this. He states that the Russian force was 30,000, strongly intrenched on the hills south of Kai-Ping. This opens the way to Niuchwang and to a flanking movement to the west of the railroad on the Russian left. There has been constant skirmishing at the various passes leading through the mountains between the Russian position along the railroad and Feng-Wang-Cheng. A column of Russians were attacked by the Japanese about seven miles southwest of Fen-Shui pass on the Liao-Yang and Feng-Wang-Cheng road and defeated with a loss of 300. At Ta Pass (Ta-Ling or Dalin) and at Mao-Tien Pass there has been much heavy fighting between small forces. Japanese forces have also been advancing northwest and threatening Mukden. Their apparent object is to keep the Russians in doubt of where the main attack is to be made, and in acting on the offensive they have the advantage of being able to concentrate a large part of their troops at a single point, while the Russian forces must be scattered along the railroad from Mukden to Kai-Ping in readiness to meet an attack at any point between. The greater mobility of the Russian forces due to their possession of the railroad is thus in a measure neutralized. The rains have temporarily ceased, but the great heat, reaching 108 degrees F., was quite as hard on the soldiers. Movements about Port Arthur are much in the dark, our chief source of news being the "trustworthy Chinamen arrived at Che-Foo," with whom we have become so familiar. The harbor is not entirely blocked, for the Russian destroyer, "Lieutenant Burukoff," ran the blockade, visited Niuchwang and returned last week. This makes the fourth trip of this vessel to Niuchwang. Three Frenchmen arrived at Tien-Tsin from Port Arthur report that the garrison there is composed of 30,000 soldiers and 10,000 marines, and that the Russians have mounted 700 guns on the hights north of Port Arthur. The Japanese have completed the chain of forts around Port Arthur on the land side at distances from six to eight miles from the fortifications. There has been some skirmishing, but details are conflicting. The garrison under General Stoessel at Port Arthur is reported to be abundantly supplied with food and ammunition. Four Japanese destroyers made a daring attempt to enter the harbor at night to destroy the fleet, as they entered the harbor of Wei-Hai-Wei ten years ago. The vessels were detected by the shore batteries and two of the boats were sunk. One escaped uninjured and the fourth had its funnel shot away. The British gunboat "Espiegle" was sent to Niuchwang, but on the protest of the Russian authorities it was withdrawn. The British China fleet, consisting of four battle ships and four cruisers, has left the British port of Wei-Hai-Wei, but its destination is not known. It is again rumored that the Russian Baltic fleet will

sail from Cronstadt the last of the month.

Africa

We have recorded (pp. 64, 1225) the opening up of Abyssinia to American commerce through the efforts of Consul Skinner, who negotiated a treaty with King Menelik, and the visit to that country at about the same time of W. H. Ellis, of New York, in a private capacity, but for the same purpose. Mr. Ellis is now again in Abyssinia bearing the treaty of commerce between the United States and Abyssinia, which fell into his hands by the mysterious disappearance of the American representative to whom it was intrusted, Mr. Kent Loomis, a brother of the Assistant Secretary of State. Mr. Loomis was last seen on the steamship "Kaiser Wilhelm II" about the time of its arrival at Plymouth, June 20, between ten and eleven o'clock at night; but whether he fell overboard or left the ship unperceived by the officers could not be discovered. Mr. Ellis, who was his companion on the voyage, proceeded to Paris and thence to Djibutil, the French seaport entrance to Abyssinia. —The "Mad Mullah" has re-entered British Somaliland with 6,000 followers, 2,000 of whom are armed with rifles and well supplied with ammunition and supplies. He was defeated with heavy losses by the British a few months ago, and on April 14th took refuge in Italian Somaliland. The natives were thought to have been thoroughly quelled, but now many of the tribes have again rallied to the standard of the prophet.—The railroad from Cape Town to Victoria Falls on the Zambesi River has been completed, and the first Cairo train on this "Cape to Cairo" railroad left Cape Town amid enthusiastic demonstrations. Victoria Falls is 1,633 miles from Cape Town, and the bridge over the Zambesi is one of the greatest of modern engineering triumphs.—Premier Sutton complains that the Ethiopian Church, which is allied with the A. M. E. Church of the United States, is striving to promote a native revolt, and states that this interference by representatives of the American negro Church might become an international question.—Strong efforts are being made to cultivate cotton in the British possessions in Africa in order that England may be freed from her dependence on the United States for the necessary raw material for her textile factories. The Cotton Growers' Association is to spend $150,000 to develop the industry in Lagos, Southern Nigeria and Sierra Leone, and the Colonial Office will contribute $32,500 for the same purpose.

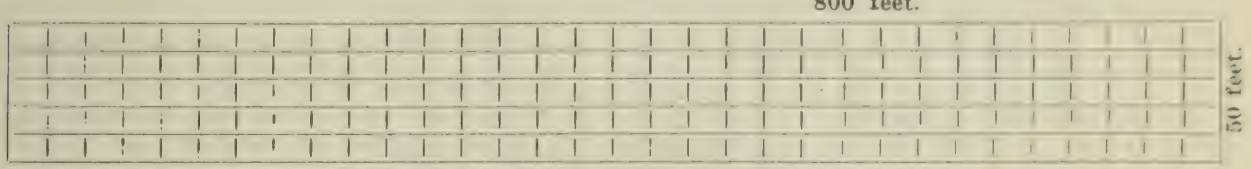
The Zionist Colony

The proposal to establish a Jewish colony in East Africa as a practicable substitute for the repatriation of the Jews in Palestine has met with opposition on the part of Sir Charles N. E. Eliot, British Commissioner and Commander-in-Chief for the East African Protectorate, who has resigned his position rather than make the grant of land offered to the Jewish Colonial Trust. He gives his reason in these words:

> "Lord Lansdowne ordered me to refuse grants of land to private individuals, while giving enormous tracts in East Africa to a syndicate. I have refused to execute these instructions, which I consider unjust and impolitic."

—Dr. Theodore Herzl, the founder of the Zionist movement, died at Vienna July 2d. It was due to his efforts that the first Zionist Congress was held, and he succeeded in interesting Jews from all parts of the world in his plan for establishing an independent Jewish nation in Palestine. For many years he had devoted all his time and money to the project. As President of the Congresses he had diplomatic relations with the most prominent rulers and statesmen of Europe and Asia, and it was through his interviews with Mr. Chamberlain that the African settlement was instigated. Besides his speeches and articles he wrote a play, "Das Neue Ghetto," and a novel, "Altneuland," to popularize the Zionist idea. He succeeded in getting a majority of the Sixth Zionist Congress (August, 1903) to indorse the African scheme, but the opposition of the more orthodox wing, which will listen to nothing but a literal restoration of the race to Palestine, was strong and bitter, and the movement, from this double attack and the loss of its most powerful advocate, may now prove abortive.

The Beauty of a Block



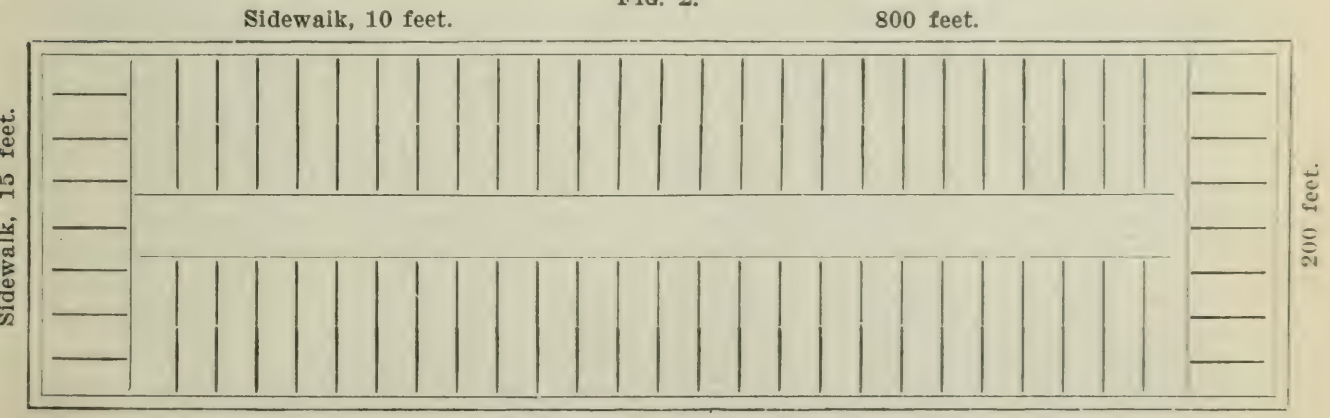
BY CHARLOTTE PERKINS GILMAN

[In her much discussed books, "Women and Economics" and "The Home," Mrs. Gilman was more of a destructive than a constructive critic. The following article shows that the author is as excellent in the latter rôle as the former. We expect to follow this article shortly by another from Mrs. Gilman's pen, entitled "Housing for Children," which discusses in detail the practical and practicable provisions that should be made for children in the ideal city home. The pencil sketches accompanying these articles were drawn especially for the articles by Mr. Vernon Howe Bailey.—EDITOR.]

IDEAS are more real than brick and mortar, and last longer. As a matter of rude external fact, the inhabitants of New York live in tremendous parallelopipeds, two hundred by eight hundred feet square and some fifty feet high. These parallelopipeds, stripped of their heavy facings and bared to the street, are of this character:

The size and shape of the block was forced upon New York by city fathers of an earlier day. It would be interesting to know if those worthies, in whose hands was intrusted so large a share of our health and happiness, really gave a thought to the necessities of human living when they thus compressed our habitations. If they did, and the thought

FIG. 1.



Front elevation of residence block.

Each proud householder or tenant occupies a vertical strip in these pigeonholes, which he calls a home, and which is, in his inviolable ideal, sacred, private, isolated. The ground plan of this group of ideally detached but actually connected homes is like this, the middle

was herein expressed, it is clear that to their minds there was no harm in a grinding monotony, unbroken ugliness, and crowding which is well nigh indecent. In another century we shall call it indecent. All these huddled houses, pressed into a solid cubical honeycomb

Ground plan of residence block.

space being the extremely private yards of these so highly separated homes, each yard being frankly open to inspection from the rear windows of the surrounding group.

(without the honey!), stand presenting their shrunken and wasted rears to one another, while the denizens have no outlook of beauty in any direction.

The one governing purpose of these

Facade of the American Museum of Natural History, Illustrating Unified Construction of a City Block

little yards, which reaches its perfect hight when the small roofless cell is frankly concreted and strung across with beams, is to dry clothes!

Herein show beyond evasion the real necessities of a home, as we view them. Beyond any dream of beauty, health, comfort or place of play for little ones comes this vital necessity of the home—a place to dry clothes! Whatever else the home may or may not be, it must be a laundry. So the scant yard space of the entire block is given up to this prime requisite. Land is scarce and dear in New York. It costs heaven knows how much a foot. But each family is expected to pay rent or taxes on 625 square feet of land—for private laundry facilities! That interior space in one block—about 50 by 600 feet—is used *one day in the week* by the surrounding 100 families merely to dry their clothes!

How about the floor space in the block?

The cellar space, amounting to 120,000 square feet, is given up entirely to the heating plant for these 100 families, with some storage. The entire basement floor is occupied by the feeding plant—sometimes the dining-room is upstairs, but the space is the same. Here are two stories of an entire block, floor space of 240,000 square feet, equivalent to 33 homes, devoted to warming and feeding 500 people.

Then comes the home proper, the place where the family lives, where it sleeps, where it rests, where it enjoys its intimate relationships, and to which it invites its friends. Out of a five-story home, two stories are surrendered to preliminaries, and the family is crowded into the remaining three.

The arrangement is simple and monotonous. The parlor floor, two bedroom floors, the cramped and stuffy bathrooms, the dark closets and basins between the chambers. Over and over and over—hundreds of thousands of them—these are the homes of New York. There are above them the palaces of the rich, and below them the far more crowded tenements of the poor, but these are the homes of people "comfortably off" on hundreds of our quiet uptown blocks.

The mechanical pressure still continuing, there has arisen to meet it the apartment house, and, under the industrial pressure, the apartment hotel; and the rapid increase and instant occupation of these edifices show that they meet a need. Against them inveighs the pious, inert-minded dweller in the past. Men who have never had a moment's grief over the horizontal pigeon-holes of a block, in which each blissfully private family occupies a vertical strip, are filled with anguish when a similar row of pigeon-holes towers upright, and each family occupies a horizontal strip.

"There is no privacy!" cries the objector. It must be that back-yard laundry he is bewailing or else the front door-steps. They have lost their clothes drier; the sacred petticoat and pillowcases must now be exposed to scrutiny on the roof, instead of in the yard, or even, in last enormity, be sent out. But, apart from this cruel deprivation and the beautiful brown stone steps on which the family might enjoy ten feet of privacy of a summer evening—if they were in town—surely there is no less seclusion in rooms arranged on one floor than in the same number scattered over four stories.

Is it the stairs which constitute privacy—the inner stairs as well as the outer steps? Perhaps there really is something in that. Those centuries in which we climbed a tree to be safe at home, pulled

up ladders, built us towers of defense, may be still stirring in our blood, and to go home without having to go up does not seem the real thing.

In the apartment house we economize at once in cellar space, but we still waste riotously in the amount of room devoted to the feeding processes. In a small seven-room flat three go to kitchen, dining-room and servants' room, leaving the family but four; or, if the dining-room is otherwise used part of the time, say four and a half.

As a result of all this, we, living in our pigeon-holes, horizontal-vertical or vertical-horizontal, suffer in body and mind and soul for lack of room, air, sunshine, peace and beauty. It has to be, we say—cities are so crowded.

That cities must be closer built than the country is true enough, but even at New York's worst the space might be so utilized as to give more living room. Much has been said and a good deal done to mitigate the gross and deadly huddling of the very poor. Cannot something be done to make life healthier and pleasanter for the middling rich—for those people who are "comfortably off" in money and so uncomfortably off in accommodation? Cannot the ground space of a block, the floor space of its buildings, be so utilized as to give to the inhabitants more room and far pleasanter provision for the same rent?

The upper floor and roof belong to the children; but grown people have some rights, too. What can we do to make our daily life at home happier, easier, rich in stimulus, rest and inspiration?

Let us look at the mechanical possibilities of the case—not asserting that people, at present, would all prefer it, but merely showing what could be done if we took advantage of city conditions, instead of merely suffering all their disadvantages.

The separate country home, under the gradually increasing pressure of the city, has been cramped into unbearable limits, all the while stoutly maintaining as essential features which are most irrelevant, and unconsciously surrendering the true elements of home life. In a country home you have light and air, quiet, the beauty of the garden, and room inside for personal expression and mutual entertainment. In the city home we have given up all these for the sake of the laundry, the kitchen and the front steps. Now, if we chose we could have in our city homes light, air, comparative quiet, room essential; in place of the garden a court of Oriental beauty, and in place of the extra

Rear View of City Block, Illustrating Present-Day Individualistic Construction

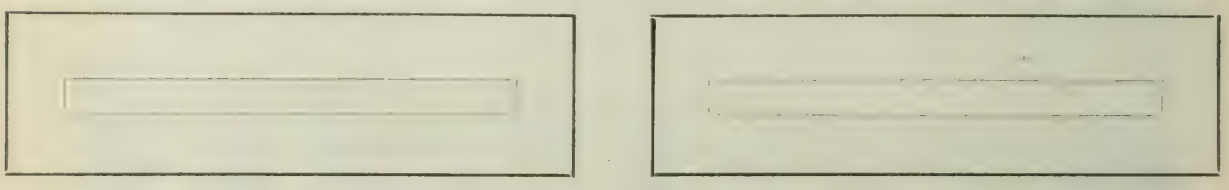
space for amusement in each home, a far broader choice of entertainment.

The city has one great overmastering advantage, the magnet which draws people to it away from every physical superiority of country—that is, social contact. The limitless stimulus, joy, rest and development that come from social relation is a power we know little of as yet, tho drawn to it irresistibly. We know it so far only in artificial form, in the uneasy, incessant friction of "society," or in the theaters and other forms of mercantile "amusement." But at home we sit starved, cramped, smothered, holding on to what we imagine is the ideal of home life, and practically losing it as we fly from the unbearable restrictions of the place to find relief and recreation outside.

Now here is what we might do. Let there be reserved for the private family life the same space they now have—the bedrooms and parlors, one of which last could still be used as a dining-room if they preferred. But the precious laundry space and the two lower floors, cellar and basement, might be put to far better uses.

Take our forlorn long blocks and cut them in two. That is easy and quite practical, as has been proved by the Waldorf-Astoria's new street. The corner and side rents make up the loss of six house fronts, and the number of inhabitants is the same.

a building frankly treated as a whole the inner homes could vary widely. Both the inner and outer face could thus differ, but on the inside would be room for more variety and beauty. Once the precious laundry is surrendered, the yard space could become an exquisite little park, a court, with vines and fountains, with delicious oriel windows, balconies, shaded corners, shrubs and flowers. Or tennis courts could be laid out, and tether ball poles set up; there is room for a good deal of pleasure in 12,500 square feet.



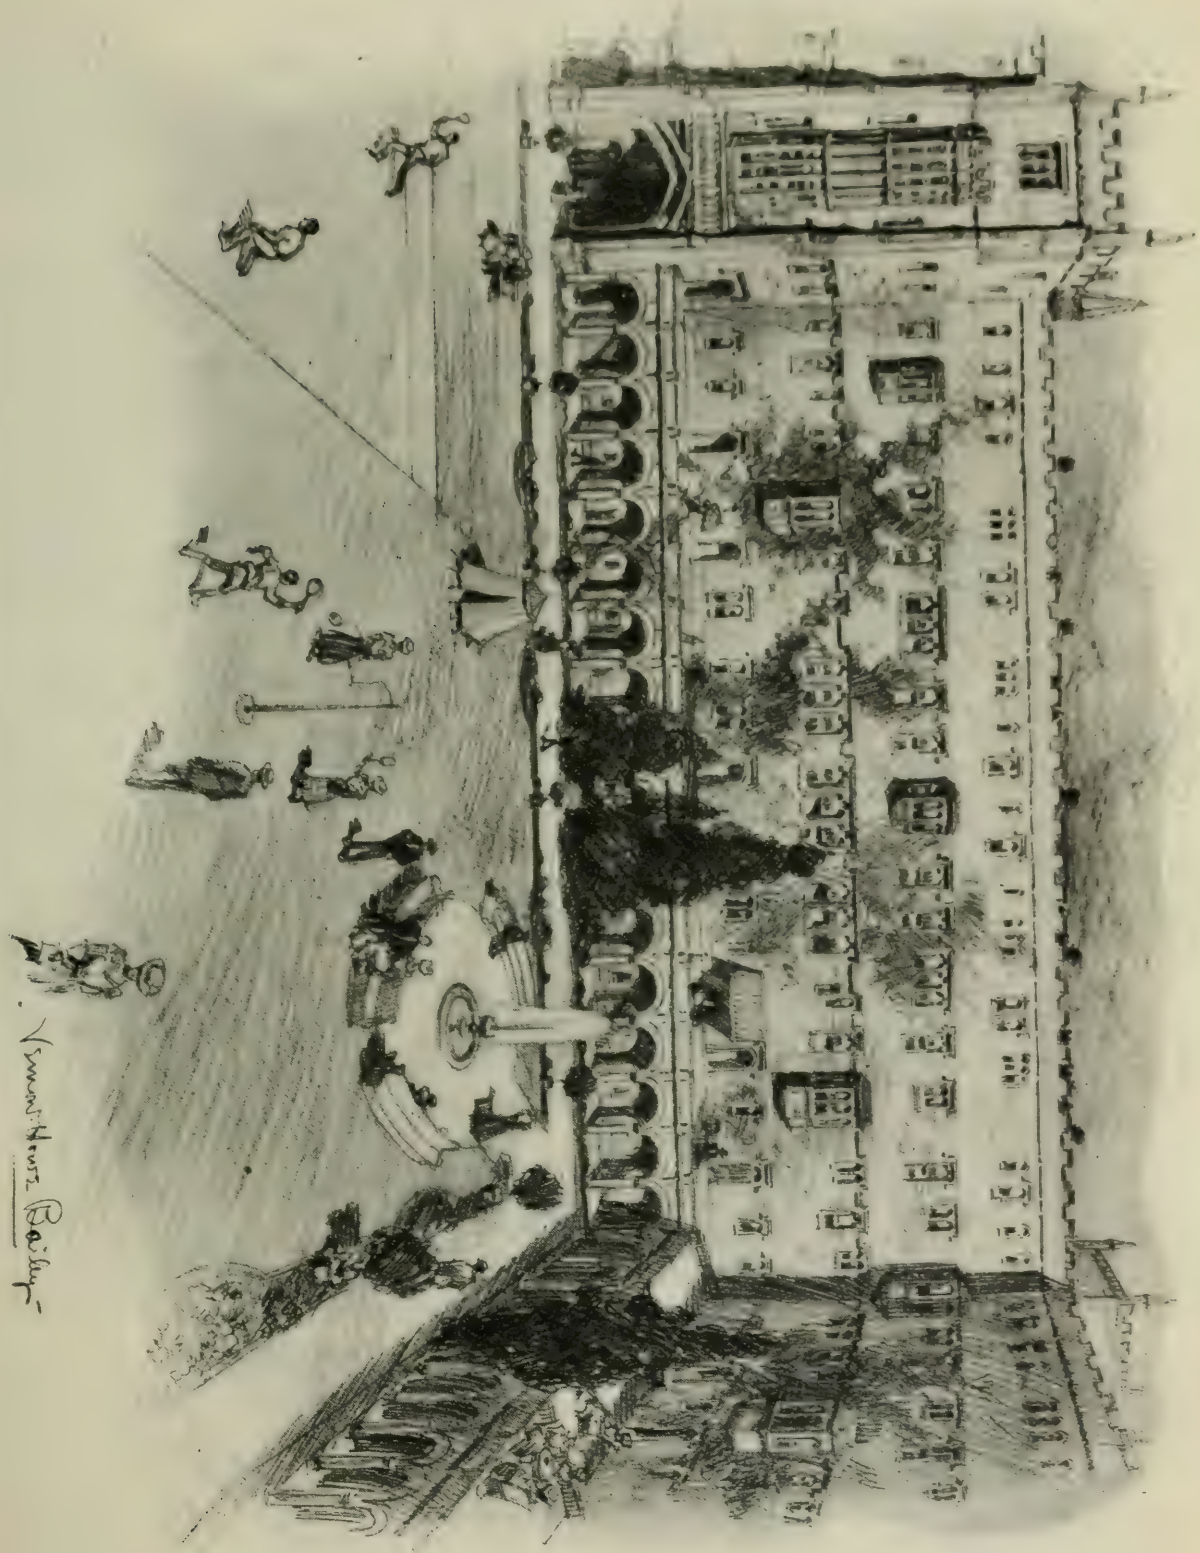
Around the whole basement story a pillared cloister could run, the top of which would form a separate balcony space for each family, from which a little stair would give entrance to the court.

Openings to the street would make this court cool and breezy, yet these could be closed in winter and keep it sheltered, and barred at all times from intrusion.

This place would be to the tenants what those elegant and select fenced gardens in little squares are to London residents, each paying for his share of its privilege in his rent. The children's playground would be, best of all, on the roof, and larger than the court; but this would give a central spot of beauty, of air and exercise, to the older occupants.

And what may be done with the two lower floors—with the great space formerly used by those wasteful families for cellars and kitchens.

FIG. 3.



You now have two buildings, 200 feet wide, with inner courts 50 by 250. These buildings could occupy the same ground space with far more variety of outline, a sufficient break in the street sides to give what is now area space and front steps to bits of protected grass, with vines and trees here and there. Whatever else does not grow well in New York, wistaria and Virginia creeper do; and the street front of a single large building, intelligently treated, could be distinctive and beautiful, without in any way sacrificing the individuality of the separate homes inside. At present they are hopelessly alike, while flattering themselves on separateness; in

The heating plant would be all in one place, requiring but a little space to serve the entire block. The feeding plant, similarly concentrated to one or two large, perfectly appointed and scientifically served food laboratories, would not require a twentieth part of the room it now misuses. If the washing must be done on the premises, one fine laundry and a bit of the roof would do it all. But a better wisdom will have all such work done in the clean, windy, open country—it does not belong in the city nor at home.

There would remain to us a considerable area of ground space, two stories high.

For this could be provided such full and perfect provision for human health and enjoyment as would make home-life endurable the year round. We should not have to fly to foreign parts, to big hotels, to noisy casinos, as a change and relief from the ideal beauty of the home. We could have in close connection with the home, open to women and girls and boys, all those attractions which we now go far to seek and pay for at double cost.

Central Court of the Proposed Unified City Block Drawn by Vernon Howe Bailey

"Our club has all the home comforts," said the man in the story. "Yes," replied his wife, "and when will our home have all the club comforts?"

When we build them into each block. When we recognize the swimming pool and gymnasium as common comforts and necessities of life. When we have billiards and bowling and all manner of easy games, shorn of artificial and dangerous allurements, and handy for mother as well as father.

When the well stocked reading-room furnishes papers and magazines to every one, and the music-room, dancing-room and lecture-room make possible all manner of pleasant association as a common custom of civilized living. All these things are now provided in our magnificent apartment houses with their magnificent prices. They could be provided to every family in an average block, and within the same rents now paid for the sacredly vertical bunch of rooms and the unspeakably holy back-yard. The figures on this come in the article on "Domestic Economy;" this is only a faint picture of the physical possibilities of a city block.

And now about the family privacy.

If desired the street front could still be perforated with separate doors; it is not beautiful, but could be made somewhat more so than at present. The rooms inside—the same space now possessed—could still be arranged in vertical layers, if preferred—so that the outside had variety and beauty to lift our lives. But they would be larger, these rooms, because less would be required of them. Because the children were provided for above, the boys and girls below; because the family could spead, if it choose, over common ground. There would still remain to it the same private space as before. If they chose they need never enter the court, need never sit on their inner balcony, nor walk in the long, cool cloister, nor swim in the pool, nor enter the dining-hall, gymnasium or reading-room.

They could have their meals sent up hot on the dumb waiter, could fill their house with as many servants as they might afford, could entertain their private friends and visit them in turn; they could be perfectly select and safe, and remain immersed in domestic bliss, the father returning to the happy haven in full content, night after night, and the mother forming a perpetual group, with babes in arms and circumambient—as is the present custom!

But even these religiously isolated families would have a more reliable food supply at less cost; better heat and light at less cost; better air, more sun, a roof space for their own children, and far more beauty around them. That is something!

New York City.

The Old Man

BY CHESTER WOOD

I LIKE the German word that means the *old*,
  Their *alt* from which ours came, because it shows
  More clear the meaning that one seldom knows,
Drawn from the Roman mine of verbal gold.
Now from the Latin "altus" see unfold
  The beauty of the term which man bestows
  Upon the aged; on whose head the snows
Of years are resting; in whose lives are rolled
  Years of experience. For *alt* means *high*,
Like *altitude*. So, *old* is *high*, or near
    To heaven and to God; and the old man
  Is like a mountain-top. He has passed by
The lowly things of earth, and with no fear,
    White-crowned, the Infinite of God doth scan.

Detroit, Mich.

Thoughts on Life

BY COUNT LEO TOLSTOY

[The following extracts are from private letters recently written by Count Tolstoy to friends in Europe. EDITOR.]

REMEMBERING my approaching end, I feel like telling you that I experience ever more strongly that which you also know,—that one should forever transfer more and more of his aims from the worldly life to the spiritual life,—to the life which is not before men, but before God: to live not in the form of this life alone, but in the form of eternal life. And to live thus it is possible only through employing all one's energy upon one's inner perfection.

People have been accustomed to think, and the enemies of truth are teaching, that perfection is egoism, that one should not draw away from life for the sake of perfecting one's self. This is a great untruth. One can perfect himself in life only and in communication with mankind. And if a man, living amidst other people, makes it his paramount goal to perfect himself before God, he will attain in practical affairs greater results than he who seeks success in external matters only.

Perhaps you feel bored by what I am writing, as by something too well known, but I am writing it because I myself live by this alone, and my experience confirms to me the truth of this.

There is but one goal of life: to strive after the perfection which Christ pointed out, saying: "Be perfect, even as your Heavenly Father." This aim of life, the only one accessible to man, is attained not by asceticism, but by working out within one's self a communication of love with all mankind. From the striving toward his correctly understood aim emanate all useful human activities, and in accordance with this aim all questions are solved.

It is possible to work much and fruitfully over the perfection of self under any circumstances, and this alone is necessary to us and to Him who hath given us life. Nay, the harder the circumstances under which we are laboring, the more fruitful both to us and to others can the internal work of self-perfection be.

To your question,—to go or not to go to the war?—I can only say that in the outward act there can be neither good nor bad. It is possible to lead a wicked life while attending to the sick, and to lead a good life while doing anything else. Only that is important,—to lead a good life—that is, not for your own sake, but for the sake of serving God and mankind, which I wish you would do, and which I advise you to do.

The usual and simple question "whether I have done everything that He who sent me hither wished me to do," arises in people when they are as yet far from death. But when death is near, there is no longer the question, there is but the consciousness of one's approach toward the just, merciful and loving God. And in this consciousness, to me at least, all questions dissolve like salt in water.

There is spiritual bliss and physical bliss. We see physical bliss and we judge it,—but not only do we not see spiritual bliss from without, often even he who receives it does not see it. And yet this spiritual bliss is not only the real bliss, it is incomparably more precious, more important than any and every possible physical bliss; and it satisfies man in his true life,—this as well as the eternal life.

One man acquires wealth, fame; another realizes the vanity of either of these; he learns to despise them and to be happy without them; who is better off?

When we say of any material loss or suffering that it is bad, we simply say that we are blind and do not see the good which is to be found in what we call bad

even as a child does not see any good in medicine given to it, or in being held back from fire.

Losses, woes, sufferings drive us out from the domain of the lowest material life, which is full of difficulties and deprivations, into the domain of spiritual life, which is a joyous and free life. It does not follow from this that one should seek sufferings, but that they, like everything else in the world, are bliss unto man.

Sufferings regulate life. When life grows too full of sufferings, the consciousness and attention rise and go over into the spiritual domain, and the sufferings cease.

God exists not in order to fulfil our desires and fancies, but we exist in order to perform His will.

The entire life of the man awakened to a spiritual life should pass in a struggle between the demands of wisdom—that is, Godly demands—and human demands, personal desires. Whether to follow one or the other depends upon the relative power, the clearness of consciousness of the essentiality to follow God's will, and the power of subdual to the judgment of man and personal desires. Only he in whom this struggle is going on can solve it.

The Kingdom of Heaven is both within us and without us. When we establish it within us it is established in the world.

The establishment of the Kingdom of Heaven within us is necessary to God, to us, and to others.

You say that it seems to you it is not sufficient to live a good life, in accordance with the demands of one's own conscience, but you wish to be able to influence others, to make others live as you consider it best.

People should be glad that there is no such means whereby others could be compelled to live as you or I consider it best. What would be the plight of mankind if each and every one could thus influence others?

Fortunately this does not exist, and one can only exert influence over others by preaching his convictions by his own mode of life.

So that to attain the second aim, the first is sufficient—that is, a life in accord with the demands of one's own conscience.

Buddhism, even as stoicism, teaches that the true essence of man is not in his body, which is not free and is, therefore, suffering, but in his spiritual consciousness, which is not subject to any oppression, and therefore is not subject to any suffering. The first makes it its aim to free from suffering; the aim of the second is toward individual happiness. And, therefore, asceticism is not the aim or the ideal of man.

The doctrine of Buddhism, like that of the Hebrew Prophets (especially that which is known under the name of Isaiah), and also the Chinese teachings of Confucius, Laotse and the little known Mi-Ti—all of whom appeared almost simultaneously, about the sixth century before Christ—all equally recognized man's spiritual nature as his essence, and in this is their great desert. They differ from Christianity, which came after them, in that they stop at the recognition of the spiritual in man, seeing in it the recognition of the salvation and happiness of man. Christianity goes farther. Starting out from man's recognition of his spirituality,—according to Christian expression,—from the recognition in one's self of the Son of God, it proclaims the possibility and necessity of establishing a Heavenly Kingdom on earth—that is, a kingdom of universal bliss, which includes universal peace.

It happens in all subjects that a child is prematurely taught something which its mind has not yet sufficiently developed to grasp. This is clearest in mathematics. It is necessary not to be in a hurry. It often happens that what a pupil could not understand under any circumstances a year before, he will understand this year from the first word, even if he has not studied the subject during the year.

The principal thing, it should be remembered, is that in pedagogy, not the pupil, but always the teacher is to blame in cases of failure.

There is no civilization except Christian civilization, yet our world is filled with learned savages.

It is not given unto man to know, for his own good, what sort of life there will be after death, and it is not necessary to know it, for if people knew it, and knew that the life beyond the grave would be worse than this life, they would be more afraid of death than they now are. If they knew that life beyond the grave would be better than this life, they would not concern themselves about this life, and would hasten to die.

So that to know what sort of life there is beyond the grave is not given to us, and is not necessary to us. The entire teaching of Christ is in this,—that man has two lives, a physical life which is destroyed, and a spiritual life which is unchangeable and indestructible. "Before Abraham was, I was," said Christ, and this is referred to us all. So soon as we shall carry over our ego into the spiritual life, and shall live but for spiritual ends, our life can no longer cease,—it is a particle of God, it always was, is and will be.

And we must do good not for fear of hell, nor out of hope for paradise, but because, living a spiritual life, man cannot help desiring anything save good. And believing in his spirituality, he cannot fear death, destruction.

As for what sort of life that will be, he does not concern himself about it, believing in God the Father, from whom he came and to whom he is going, and with whom he lived, lives now, and will live.

YASNAYA POLIANA, RUSSIA.

The Mind of Muley Aziz

BEING AN ATTEMPT TO EXPLAIN THE SITUATION IN MOROCCO

BY POULTNEY BIGELOW, M.A., F.R.G.S.

[Mr. Bigelow was on the cruiser "Brooklyn" at Tangier during the recent demonstration to secure the release of Mr. Perdicaris. This article presents a very interesting picture of the young Sultan who is trying so hard to catch up with our modern civilization.—EDITOR.]

MAHOMET was twenty-five years old when he married Kadijah, who was fifteen years older, and who more than any one else strengthened the hand of the Prophet in his labors to combat idolatry and establish a new and purer creed among the people of his race.

The blood of this Prophet drags languidly through the amiable arteries of Muley Abdul Aziz, Emperor of Morocco, and it has been dragging languidly for the past twenty-five years.

Kaiser Muley is in advance of his people; he is very much "up-to-date." Mahomet of Mecca could neither read nor write and knew little of the world save what he learned from driving a camel over the Arabian desert. But Mahomet, like Paul Kruger, knew his own people, and for a politician that knowledge is more precious than all the volumes in the British Museum.

Kaiser Muley might do worse than invite Paul Kruger to Fez for the unique purpose of teaching him how to behave in times like these; or, if Oom Paul is busy, might I propose the Honorable Richard Croker, of New York and "Wantage"?

Mahomet disapproved of portraits because to him they suggested idolatry. Today no orthodox Moor permits himself to be photographed, no orthodox Moorish house contains pictures of people.

Kaiser Muley, however, ordered a kodak—not one, but a dozen. He created the post of Court Photographer and had his sacred Moslem person photographed; and if there could be anything worse than that it was to have this same photograph multiplied and sold at one cent apiece throughout the cities of the Mediterranean, to the scandal of every Moslem from the Himalayas to the Pillars of Hercules, and the corresponding delight of Jews and Gentiles.

It was a Christian who put this idea into the amiable head of Kaiser Muley, and I am told that the said Christian did so for the sake of money.

For he said to the successor of Mahomet: "Your Majesty is a great mon-

arch—like your brother of Great Britain. King Edward is photographed; indeed, many members of his family take photographs themselves. If your Majesty proposes to be a real ruler like King Edward, then you, too, must have a kodak!"

And so to-day there are up at Fez dozens of photographic boxes of every imaginable make, one being for imperial use, entirely of gold and having cost more money than Mahomet himself ever spent on his fifteen wives in any one year as chief Prophet.

As near as I can get the figures to-day, Kaiser Muley has spent several thousand pounds on this one gold kodak and accessories.

Kaiser Muley knows nothing of the great world save through a dozen Europeans who live about him at Fez, and who persuaded him to buy monstrous toys at fabulous prices.

There is a little strip of water at Fez—enough of it to sail model yachts or possibly a diminutive naphtha launch. In an evil moment Kaiser Muley heard through the mouth of a Christian adviser that the great King Edward owned a steam yacht and that, indeed, all great rulers had them. The Sultan was persuaded with ease—he would have one for his little strip of water at Fez.

THE SULTAN OF MOROCCO

But the Christian adviser had larger views—at least, financially—for he promptly negotiated, not for a launch, but for a seagoing royal yacht, which, in course of time, reported itself off the coast of Morocco and demanded transport to Fez, a distance of some two hundred miles overland!

Kaiser Muley paid for this yacht many times more than it was worth and soon afterward sold it for scrap iron, for it had no value in his eyes once that his whim had been gratified.

He had placed himself, he thought, high in the opinion of his cousin and fellow yacht owner of Windsor Castle by asserting his equality on the seas no less than in the field of amateur photography.

And then came King Edward's coronation to torment this son of the desert. His Christian adviser said to him: "The British King has a coronation coach—all great rulers have gaudy carriages and magnificent harness—it strengthens the feeling of loyalty among the masses. The Sultan of Morocco cannot afford to make less display than his brother monarchs of Austria, Russia and England."

So the coach was ordered—the most theatrical and costly thing of its kind that Bond Street dealers could invent for a weak-minded spendthrift with a negro love of finery. The Christian adviser shared in the profits of this colossal criminal nonsense.

Even those of us who have seen the coronation of King Edward have but a faint notion of the lurid light which flashed between Tangier and Fez when this dazzling toy moved on its way from the sea coast to the imperial palace amid the ragged subjects of Kaiser Muley.

The coach finally arrived, and with it harness so heavy with ornament that few horses in the empire could have supported its weight, even had they been broken to this form of exercise. But the Sultan had no horses broken to harness, and he wanted to have his toy at once. He was in no mood to wait, and for that matter they would have looked like donkeys drawing a Fifth Avenue 'bus had he attempted to make wheelers of his mustangs.

So he ordered out his army and harnessed them into the traces. The Christian adviser was made to sit inside, another Christian stood upon the board intended for the footmen behind, while Kaiser Muley mounted onto the box and waved his whip over the brown backs of his Mohammedan warriors.

They trotted happily round the palace yard, Kaiser Muley delighted with the sport, and still more so in the thought that he was doing just what King Edward would have been doing under the same circumstances.

That night it rained, and when it does rain in a thirsty land like Morocco it drops in sheets and permeates as on the equator.

Next morning the gorgeous coach looked like something made of poor pulp; the upholstering, the decoration, the leather work and even the painting reminded one of a carnival party after a long walk home in the rain.

The Sultan soon wearied of this toy; it was pushed onto the rubbish heap, and there it may be seen to-day as tho to tell the passing stranger that it will not be required for any coronations—at least not in Morocco. The money wasted on this coach would have sufficed to build a sewer through Tangier.

Mahomet was a man of stern simplicity—much like William I of Germany. To be sure, he had fifteen wives, but then the market price of this commodity was lower in the Arabia of his day than it has been latterly, even in Germany. Moreover, Mahomet enforced economic habits among these fifteen ladies; each had a small cabin to herself, and it is not likely than any one of them cost him more than $500 a year.

Mahomet disliked the idea of a crown—he never wore one himself—for it seemed like usurping a prerogative of Allah, in whose eyes he was but a servant.

The Christian agent at Fez showed Kaiser Muley a highly colored supplement in one of the London papers portraying King Edward in his coronation robes, with a crown resting on the table. The insidious Christian pointed out to the plastic Mahometan that all great rulers wore crowns, or, at least, kept one handy, tho they might not wear it every Sunday.

ION PERDICARIS.
Who was captured by Raisuli

"But," said Kaiser Muley, "my religion does not permit me to wear a crown!"

"Nobody wants you to wear the crown," answered the plausible adviser. "But you might just buy one and be photographed with it alongside of you, just to show that you are a ruler like King Edward."

So the Christian adviser was told to buy a crown. It proved to be about the most expensive one that could have been made, or charged upon a bill. It cost several hundred thousand pounds and there was, of course, some profit for the Christian adviser.

Any one of these various orders would have been enough to brew dissatisfaction. But Kaiser Muley seemed incapable of noting this. His feeble and conciliatory intellect was fascinated by the silly flattery and plausible propositions of white men who should have shielded him. He blindly jeopardized the stability of his throne in puerile efforts to prove that he was the equal of King Edward and the rest of the royal family.

One day he heard that King Edward rode in a motor car, and forthwith he

ordered, not one, but several dozens of them. They are now in the general junk shop of the palace at Fez, about as useful to the people as the famous astronomical instruments which I found in 1876 mounted on the walls of Pekin to recall a day when China coquetted with science from Europe.

Now, what hope is there for a country under such a ruler?

Morocco is merely a geographical concept stretching over that corner of Africa which France envelopes by the whole of her land frontier. This vast Morocco is but another name for an undeveloped country in which the sole government vests in a multiplicity of tribes, each of whom is self-governing according to tribal custom, and who acknowledges Kaiser Muley not as a Kaiser in the German sense, but as one who deserves respect on strictly theological grounds as the representative of Mahomet—a sort of Moslem Archbishop.

So long as Kaiser Muley keeps away from kodaks and motor cars and limits himself patriotically to the Koran and his harem, the scattered tribesmen have no fault to find. On the contrary, they will honor his name and his messengers after the fashion of orthodox sons of Islam, and they will cheerfully go forth to battle under the green banner of the Prophet.

In other words, when Kaiser Muley refrains from government his government appears to be government. But the moment he attempts to rule on the European plan there is anarchy throughout his dominions.

He has sought to make a European army; he has discarded the national dress under which the Saracens once laid the Roman Empire in the dust, and has clothed his so-called warriors in uniforms such as soldiers in England wear. The result is that his army looks like a mongrel troop of Panama militia, and I have yet to hear that they inspire terror save in the breasts of peaceful peasants.

They dare not go out and collect tribute; they cannot enforce the orders of their Emperor. Kaiser Muley is weighted by debts; he has nothing to show for the money he has wasted, and, worse than all, he does not appear to have a friend in the world—not even among those Christians who have grown fat at selling him trashy toys.

Bavaria deposed Ludwig the Second because that fanciful monarch spent thirteen million marks more than his budget had anticipated. But he spent them on music, painting, architecture—Richard Wagner, and to-day thousands of pilgrims visit his palaces and bless his name as they listen to opera in Munich. And, moreover, these pilgrims have money enough behind them to justify the conduct which a few years ago was regarded as madness.

Kaiser Muley can scarcely hope for such posthumous honor. He has not done a thing for which any of his subjects can be grateful. He has not built a mile of road; he has not dammed a river or bored an artesian well; he has not improved a harbor; he has not erected a lighthouse; he has not founded a school; he has not even placed his costly toys where they might serve the purpose of a museum.

It would be hard to find in history another example of so amiable a monarch who has spent so much money in so short a time without leaving behind him at least a few stones with which to awaken curiosity, if not gratitude.

He has handed his country over to France.

Art and Architecture of the Exposition

BY E. L. MASQUERAY

[As the creator of the general plan of the Louisiana Purchase Exposition, Mr Masqueray is particularly well qualified to speak of the development and carrying out of the architectural and artistic features, and we are fortunate in being able to obtain the following interview, in which he explains the motives and methods of construction. Mr. Masqueray was born at Dieppe, France, was a pupil of L'Ecole des Beaux Arts, Paris; was sent to Italy by the French Academy of Fine Arts, and was awarded a gold medal in the Paris Salon of 1903 for his drawings of the Castle of Urbina (Italy). He worked for the Commission of Monuments Historique of France, and gained many prizes in L'Ecole des Beaux Arts. In 1887 he came to America, became connected with some of the best architectural firms of New York, and in 1893 founded the Atelier Masqueray for the study of architectural composition, this being the first successful attempt to apply the Beaux Arts methods in America. He started the Decorative Arts Course at Cooper Union, and was one of the charter members of the Beaux Arts Society of Architects, New York. His appointment as Chief of Design of the Louisiana Purchase Exposition was given by the Exposition Commission of Architects.—EDITOR.]

IN designing an exposition, the architectural whole must be made to fit the ground on which it is to be placed. The St. Louis site, as it stood unadorned by buildings, two years ago, presented no water front, as in Chicago; no river, as in Paris; nor any natural advantage of water; but there was a noble hill and a beautiful park, while in front of the hill lay a flat stretch of ground. These natural conditions made possible an exposition design entirely new. Taking advantage of the hill as a focal point, the first step was to create three main avenues radiating from that high point, so that from anywhere along these avenues one might get a vista, terminating with a highly decorative feature in the center. The necessity for transverse avenues crossing the other three gave immediately the general outline of the eight main buildings of the Exposition, which by that scheme were located on the flat portion of the grounds. Such a position for them was extremely desirable. Their enormous size made necessary a site as nearly level as could be, and it was a decided advantage that the natural lay of the

E. L. MASQUERAY
Copyrighted, 1904, by J. C. Strauss

ground lessened the expenses of grading.

The situation of the main buildings provided a sort of broken line for the main avenues, giving noble values and different effects, as if at each new turn a new door on the vista was opened, while the introduction of water, trees, grass and shrubbery to the fullest extent along the avenues imparted an impression of coolness and freshness.

With such a general plan established for the main buildings of the Exposition, nificent boundaries stretched the Grand Basin, flanked on north and south by the large exhibit buildings. Macmonnies's Columbian Fountain and the lofty shaft of the statue of the Republic faced one another across the Grand Basin. Into the basin the water was brought from Lake Michigan.

The Pan-American Exposition at Buffalo could command Niagara Falls. Five thousand horse-power was used for the electrical ilumination and for the

Steps Leading to the Waterways; Manufactures, Liberal Arts, and Education Buildings in the Background
Copyrighted, 1904, Louisiana Purchase Exposition Co.

it remained to connect them all by some effective composition on the hill; in other words, to give to the body its soul.

At the Columbian Exposition of 1893 the Court of Honor, with its monuments and inscriptions to pioneers of civilization and American history, was the thought-center. To the west of the court stood the Administration Building, its splendid dome suggesting the Capitol at Washington; to the east was the Peristyle, with its forty-eight columns for forty-eight States, its statuary above representing the races which have made composite America. Between these magfountains; riotous strength was the theme of the Court of Fountains. Ninety-four searchlights blazed from the 400-foot electric tower, while in the basin abundant fountains scattered spray fifty feet above the surface of the water. The brilliant coloring of the buildings gave the title of the "Rainbow City."

For the Louisiana Purchase Exposition water could be freely introduced, and for the electrical and other displays there was finally the unparalleled force of 54,000 horse-power, but the natural hill, clothed in such landscape and sculpture and architectural decoration as should

properly interpret the significance of the Purchase, was to be the chief feature. It was decided to put in the center a great Festival Hall, designed by the same architect who designed the Art Palace. Two decorative pavilions were placed on each side, to the east and the west, on the hill, within the axis of the main avenues. To connect these three features architecturally, so as to give unity of feeling to the whole, a colonnade was developed, made of a succession of hemicycles, in each of which—their number being fourteen—stands a colossal statue to represent one of the fourteen States of the Louisiana Territory. Thus appeared the *motif,* to be clothed with cascade and landscape and sculpture, all helping in the interpretation. This "ensemble" was conceived by E. L. Masqueray.

From the central point of eminence fall three cascades, carrying 90,000 gallons of water to the main basin, the circle of which is 600 feet in diameter. The central cascade is "The Fountain of Liberty," crowned by allegoric figures, while the eastern cascade is "The Atlantic Ocean," and that on the west "The Pacific," the idea illuminated by appropriate sculpture—American liberty extending from ocean to ocean.

Below, on the level ground, at the crossing of the main avenue and the first transverse avenue stands the Louisiana Purchase monument, also by the Chief of Design, a shaft nearly 100 feet high, crowned by the statue of Peace, calling nations, as it were, to friendly competition. In front of this, at the foot of a decorative obelisk, is a group representing the signing of the treaty by American and French diplomats. On each side are allegorical female figures, "The Missouri River" and "The Mississippi River," which have played so important a part in the development and civilization of the Louisiana Territory.

At the north end of the main avenue is the St. Louis monument. The French King is represented in the costume of his time,—the thirteenth century. In front is a beautiful group, the City of St. Louis greeting the world. Two other historic figures are colossal equestrian statues, with appropriate inscriptions, of Joliet (in front of the entrance to the Manufactures Building), and facing this (in front of the Varied Industries Building) of De Soto, who discovered the Mississippi River.

It will be noticed on the Exposition grounds that the water effect is such that the Grand Basin and the waterways appear as a continuous part of the landscape and not as holes dug in the earth. The water has been kept level with the ground as nearly as possible, and when the natural depression was deeper than was really wanted the shore was graded and made to slope downward. At each landing are round obelisks supporting richly decorative statuary. By night these are vividly mirrored in the clear water; and by day they project pure white against the green trees, and link the architecture on the large buildings with the landscape. This fancy is maintained throughout the grassy portions of the grounds in white daisies everywhere against the green.

The bridges, designed by E. L. Masqueray, placed at different locations connecting entrances of large buildings, are interesting points in the general perspective. Their open balustrade is in a sort of wave design, and ends in massive pedestals carrying elaborately decorative flagstaffs.

Peculiar difficulties confront the architect of large exposition buildings. The doors of the buildings must be enormous, the windows must give a great deal of light, the outside of the building must be effective, and perhaps the hardest undertaking is to keep the cost moderate. Some *motif* of decoration is wisely adopted which can be cast and repeated in many different ways, giving beauty without great expense and yet avoiding monotony. For this purpose the column has been used with splendid results by the architects of the Louisiana Purchase Exposition.

In the Building of Varied Industries the architectural decoration consists of Ionic columns on a very high base, pierced by arches, and on the south side is an entrance decorated with a free colonnade of large Ionic order—a feature distinctly novel.

Carrere and Hastings, of New York, architects of the Manufactures Building, have created a beautiful Corinthian colonnade on the west portion of this building. At the corners are round pavilions, with flat Roman domes, while the imposing central entrance is crowned

by a splendid quadriga. The south *façade* introduces as a central *motif* a colossal niche in which appear all the entrances to that part of the building. This magnificent scheme has been beautifully worked out, and is one of the most effective pieces of architecture in the whole Exposition.

The Education Building, designed by Eames and Young, of St. Louis, is 525 by about 700 feet on the long *façade*. A Corinthian colonnade of great beauty surrounds the whole building, reinforced at the corners by decorations which give strength to the appearance of the structure. In the center of each of the four *façades* is a monumental entrance of triumphal arches framed by Corinthian columns grouped two by two, above which is a classic attic with allegorical figures typifying the benefits of education. Above the colonnades a balustrade is intersected with pedestals carrying richly decorated vases or gayly adorned flat urns. The feeling which permeates the whole building is one of dignity and distinction.

Twin companion to the Education Building in dimensions and general shape is the Electricity Building, of which Walker and Kimball, of Boston, were the architects. Splendid Corinthian columns are used, carrying a richly decorated cornice supporting balustrades, on which vases and flat urns give a diverting and festive effect. Many striking features are introduced in this building. The towering pyramidal corners are crowned by very original groups of sculpture illustrating the wonderful discoveries of electricity. The entrances are treated most imposingly with Corinthian columns flanked by highly artistic sculpture groups.

The Liberal Arts Building, to the east of the Manufactures, is one of the most elaborate architectural designs in the Exposition. Barnett, Haynes and Barnett, of St. Louis, were the architects. Both the Doric and the Corinthian order are used in the decorative scheme, the Corinthian columns being kept for the entrances and made in colossal size. Colossal statuary stands at the sides of each main entrance, and the attic over the entrance is supported by colossal

caryatids in the shape of Cyclops. The Doric columns, grouped two by two, have been employed in a colonnade connecting the different corner and central *motifs,* and over the colonnade runs an elaborate coping intersected with vases of fanciful and artistic design. The style of the building is a sort of modified Louis XVI, and the whole appearance is one of sumptuous detail.

Directly opposite the Liberal Arts Building, and of the same dimensions—525 by 750 feet—is the Mines and Metallurgy Building. The designer, Theodore C. Link, of St. Louis, has departed entirely from the classical forms adopted by the architects of the other buildings of the Exposition. Massive piers are used, richly decorated and crowned at the top by capitals derived from the Ionic. Between them are small columns Byzantine in feeling, resting on a low wall decorated with bas-reliefs relating to the industries of mines and metallurgy. The building's entrances are large, square openings, surmounted by a wall surface and flanked by obelisks. Above the center *motifs* are large decorative figures surrounding a globe supported by smaller figures and serving as a sort of dome to crown these very original features. At the corners of the building are smaller entrances upheld by standing figures placed against a richly decorated background. A very projecting red tiled roof gives a tropical note to the Mines and Metallurgy Building, and if the original plan had been carried out (which at the last moment was found to be impossible) of supplementing the decoration by a color scheme of metallic *façades,* it would have greatly set off the Egyptian obelisks and have given quite an Oriental effect to the Byzantine detail.

The Machinery Building, the designers of which were the St. Louis firm of Widman, Walsh and Boisselier, is 525 feet wide by 1,000 feet long. Its arched main entrance on the south side gives access to a beautiful vestibule vaulted with five domes. On each side of this entrance are two square towers, 200 feet high, crowned by square domes, richly decorated, at the top of which the Corinthian order is used. Similar square towers with square roofs add strength

to the corners of the building, their Corinthian decoration supporting splendid pediments. These different *motifs* are connected by a row of rich arches carrying a graceful cornice and balustrade. The festive appearance so necessary to an exposition building is hightened by the intersected flagstaff pedestals, and the roofs are gayly decorated in color.

The Transportation Building is the largest in the main group of eight buildings, its dimensions being 525 by 1,300 feet. It was designed by E. L. Masqueray. The east and west *façades* present three enormous arches, 64 feet in diameter, separated by massive pylons, which are richly decorated at the top and used as background for effective seated figures. The gigantic porch formed by these arches is flanked on each side by a round tower supporting round pylons, surrounded at the base by highly decorative seated figures. The sides are very similar, consisting mainly of a succession of very wide openings, which give to the interior an enormous amount of light. In this structure the architect has tried to get a very decorative effect by the introduction of sculpture with plain walls, and of large openings, which give the impression of strength. The style is a free adaptation of the Louis XVI.

The United States Government Building is located on the hill, fifty feet high, this position giving it fitting prominence. It is an attractive structure, 700 feet long by 175 feet wide, decorated with a classic Ionic colonnade, the central *motif* carrying a rich attic surmounted by beautifully proportioned pediments and crowned by a flat Roman dome.

To those to whom dimensions mean a great deal the Agricultural Building will appear very remarkable. It is 500 feet wide by 1,600 feet long, and is the largest building ever built to cover a single department of exhibits. It covers

East Restaurant, with Fountains Playing

North Dakota in Colonnade of States

Copyrighted, 1904, Louisiana Purchase Exposition Co.

twenty acres. For exhibition uses the building is absolutely perfect, as the light is faultless, coming in from enormous windows on every side. So great is the size of these windows that they could properly be called glass walls. Their width is in some cases 72 feet. A difference of 16 feet in the level of the south and the north ends of the building has been made imperceptible by the architectural arrangement. The entrances of the building constitute enormous arches, 80 feet high, richly decorated at the top with ornamental sculpture.

To speak last of the Art Building, which in many minds will come first, it is composed of three structures, the center one being of stone, designed to remain after the Exposition is over, as a memorial of the Fair. The two side wings are of temporary, but fire proof, material. The Art Building and Festival Hall exterior were designed by Cass Gilbert, of New York. The main entrance of the central building is decorated with beautiful Corinthian columns supporting statues, which typify the different periods of art, and at both the entrances are fine allegorical bas-reliefs. The Roman gable wall is pierced by large half-circular openings, and towers above the main entrance, accentuating on the outside the sculpture hall, which is in the center of the main structure. The sides of the building are lower, with corner *motifs*, where Ionic columns frame pediment-crowned niches, which give an appropriate resting place to lovely seated figures. The use of the Greek or Roman Ionic order on the side wings gives a properly dignified and impressive appearance.

Looking on the court toward the gardens the *façade* of the side wings has been treated in a simple, more playful manner. The plain walls are pierced by a series of arcades with decorative *motifs* in the earliest Rennaissance style. A very projecting red tile roof is supported by elaborate brackets, and a frieze of richly ornamented panels crowns the building. This has been highly decorated in color.

To the south, between the two wings, stands the International Sculpture Hall, a simple building of good proportions, 100 feet by 200, designed by E. L. Masqueray. The main object in this was to build a well-lighted exhibition room to shelter the masterpieces of the great sculptors of international reputation. Both ends of the building end in hemicycles, which are features both on the inside and the outside of the building. The four buildings constituting the Art Palace are set off on magnificent terraces surrounded by a classic balustrade.

Plantation Pictures

BY MARTHA YOUNG

SPEAK OF AN ANGEL.

WAS you at de baptisin' yistiddy, Sal?
When dey put under ole man Isham's gal?
'T was de joyfulles' meetin' I ever is seen,
I went in de ox-cyart wid ole man Green!

When de preacher put Susan into de pool
She come up hollerin' and shoutin' in de cool:
"Oncet I was lost! Now I is foun'!
I seed Saint Gab'iel when I went down!"

Dat half-wit Carter, he's mos' a plum fool—
He been baptise, and des come out de pool;
He say: "Dat wan't no Saint Gab'iel, Sis' Sue;
Dat was des a mud turkle. I seen it, too!"

THE PROGRESS OF A PICKANINNY.

DIS chile's brung up pintedly right fer sho,
He's fotch up de way dat he ought to go;
Dar's not a man's hat done tetch on his head—
Dat's make him teeth hard—de ole folks said.

Dar's a dog-tooth hangin' right now on his neck,
And a silver picayune, I 'spec',
And elder-pith on a cotton string,
And a conjer-bag, and ever'ting!

Us got his pallet-lock tied up tight,
And de almonds of his ears is rubbed up right;
Us ain't let de chile look into de glass—
(Ef a chile see itself it soon will pass).

Us tote no chunk o' fire befo' his eyes,
Us ain't let nobody medjure its size—
Yas. If Gord sesso he'll grow and he'll th'ive,
And one hund'ard years stay hearty and live.

PLANTATION PHILOSOPHY.

UNCLE SAMPSON'S RULE.

GIVE you some 'bacco? I ain't got a bit,
Dat's somethin' I done long since quit;
And I tell you hit's save' me a many a dollar
Sence I quit chewin' what I couldn't swaller.

So, heah's a tune you can fit to any song,
For it's nigh 'bout as broad as 'tis long;
Don't jump any coon you can't run to de holler,
Don't waste any time chewin' what you can't swaller.

Don't start into nothin' you can't clean out do,
Don't lift any load you can't tote clean through;
Don't turn down de road you ought not to foller,
Don't chew on nothin' dat you can't swaller.

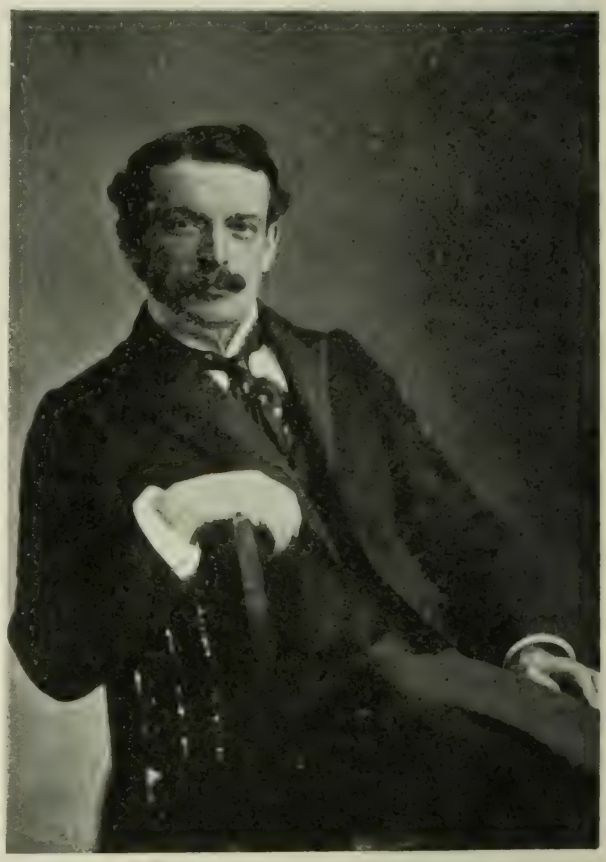
GREENSBORO, ALA.

The Exhausted Parliament

BY JUSTIN McCARTHY

I HAVE seen or studied many British Parliaments in my time, but I cannot recall to recollection any Parliament which seemed toward the close of its existence so thoroughly exhausted as that which is now holding its sititngs in London and may, so far as we can judge, make up its mind to drag out its existence even into another session. It is not merely as if, to adopt the familiar French phrase, this present Parliament had fulfilled its mandate. I do not know whether it had actually any mandate to fulfil when it came into legislative existence, but certainly no evidence of any particular mandate seems to have been given throughout its progress thus far. In the ordinary course of things it might yet have some time to work its will, supposing it to have any, before reaching the limit of time appointed by rule and prescription as the length of a Parliament. But it appears to have no inclination to do anything in particular, and it only spends its days in carrying this or that measure, much needed or little needed or not needed at all, through some early stage of its movement and then letting it drop out of notice. For weeks and weeks it has gone on making a pretext of doing work and spending for the most part its time in barren and uninteresting debates about nothing in particular. The leaders of the Administration evidently do not desire to commit themselves for the present to a definite course of policy on any great subject, home or foreign. There is a theory among some members and some outer observers that Ministers are only waiting in order to give Mr. Chamberlain time to renew his agitation on the question of preferential tariffs, and then to make up their minds finally as to whether it would be for their advantage to go with him or against him on his newly adopted policy.

I think, however, the main weakness of the present Parliament lies not so much in the hesitating action of the Government as in the condition of the two great opposing parties. The readers of THE INDEPENDENT are already well aware that the Conservatives are utterly divided among themselves on the great question of tariffs. Some of the leading and most influential men in the Conservative party have openly broken away from any association with the movement which Mr. Chamberlain so lately started. Men who held high and commanding official positions even in the present Government have publicly and formally withdrawn from the Ministerial benches and are now private and independent members of the party. But, on the other hand, the ranks of the Opposition are divided and distracted among themselves and appear unable to unite thoroughly on any great question which occupies the attention of the country. Lord Rosebery used to be at one time accepted as a powerful and a trusted leader of the Liberals, but just now nobody appears to know exactly what his opinions are on some of the most important subjects in our political world, and every speech which he makes seems only to cloud his purposes with an increasing and bewildering obscurity.



Some of the most distinguished and intellectual members of the Liberal party in the House of Commons, men, for instance, like Mr. John Morley and Mr. James Bryce, have assumed a position of thorough independence, and when they do take part in a debate, which does not often happen, they speak as if they acknowledged no ruling authority in the men who still hold the rank of recognized Liberal leaders. Let me say at once that I am far from finding any fault with the course taken by Mr. Morley and Mr. Bryce and other distinguished Liberals. I believe they are actuated by a just and an honorable spirit and that they cannot see their way to adopt the course of policy which seems to make the Liberal party so often a mere auxiliary and abettor of the Conservative Government with regard to what is described as Imperialist policy. I am afraid there can be no doubt that not a few of the prominent and influential Liberals in the House of Com-

WINSTON CHURCHILL

mons have been more or less corrupted, if I may use this somewhat strong expression, by the Imperialist passion which has latterly taken hold of the British public and has already led to some deplorable results. It certainly has had a very unwholesome effect on the Liberalism of such men as Lord Rosebery and of many others whom I could name. But it would be impossible to get men like John Morley and James Bryce to submit themselves to the influence of this baneful passing humor, and, therefore, these two men and others like them go their own way and advocate their own principles when any public opportunity affords itself and prove themselves genuine Liberals, and not merely members of what is now called the Liberal party.

Let me give two other illustrations of the manner in which distraction has lately been prevailing in both parliamentary parties. Among the younger men in the House of Commons the two most rising debaters and, indeed, orators are Mr. Winston Churchill and Mr. Lloyd-George. The former of these was until the other day a member of the Conservative party, although he has ever been a man who, like his gifted father, the late Lord Randolph Churchill, had a spirit too independent to submit to the mere thralldom of calculated official discipline. Lately, however, he has actually broken away from the Conservatives and has crossed the floor of the House of Commons from the Ministerial side and taken his place on that bench of independent Opposition which is described as "below the gangway." Mr. Winston Churchill has ceased to be a supporter of the Ministry because he could no longer endure the reluctance of Ministers to make up their minds as to the policy of Mr. Chamberlain and other great questions which may well claim a national interest. On the other hand, Mr. Lloyd-George is one of the

DAVID LLOYD-GEORGE

most eloquent and rising men among the Liberal ranks, but he has on many questions of great importance acted with an absolute disregard for what his political leaders might desire to direct as the opportune course for the Liberal party to adopt. Mr. Lloyd-George delights the House by brilliant speeches full of argument, eloquence, spirit and humor, in which he vindicates to the full the genuine doctrines of real Liberalism and never yields for one moment to the seductions

of the Imperialist movement. It is surely something of a significant fact that the two ablest among the rising men of the House should thus show themselves absolutely independent of the ominous weaknesses prevailing over the Ministerialists on the one side and the Opposition on the other.

A considerable section of the Liberal party—I mean especially among those who claim to be its leaders—are openly proclaiming their withdrawal from that cause of Home Rule in Ireland to which Mr. Gladstone devoted the latest and greatest efforts of his eloquence and his statesmanlike genius. Men like Mr. Morley and Mr. Bryce are faithful as ever to this cause, and Sir William Harcourt has never withdrawn from the principles maintained by his late and great leader. Sir William Harcourt is, however, soon to be lost to the House of Commons, and I can only hope that Sir Henry Campbell-Bannerman may prove himself strong enough and resolute enough for the leadership of a Liberal party worthy of the name.

Meanwhile I can assure my American readers, and especially my own countrymen in the United States, that no weakness and no falling away among Liberal statesmen can affect in the slightest degree the success of Ireland's national cause. The Liberal party which is to be formed after the next General Election will soon find that the question of Home Rule will have once again to be accepted as the foremost principle of Liberalism, and that the early success of Home Rule is as certain as any coming event can well be. The cordial allegiance of the Canadian Dominion and the Australasian Commonwealth has been won for the British Empire by the recognition of the Home Rule principle, and under such conditions only can Ireland ever become a contented, a loyal and a willing partner in King Edward's Imperial federation.

PHILLIP STANHOPE

In my last article for THE INDEPENDENT I announced the appearance of Mrs. Campbell Praed's remarkable novel, "Nyria," and the striking and peculiar introduction with which she presented it to the reading world. As I ventured to predict at the time, the novel and its preface have already created some controversy among English reviewers and the reading public in general. I have read the book with intense interest and I have no hesitation in describing it as one of the most striking and suggestive stories given to the world during recent years. The scene of the story is laid in Rome during the latter part of Domitian's reign, and it brings before us the life of the Roman capital in those days with a vividness which makes us feel as if we were living and moving in the midst of the life which then prevailed in the city of the Cæsars. Even if we accept as deliberate and literal the brief account of the manner in which Mrs. Praed tells us she obtained her inspiration, it is none the less obvious that only the most careful and minute study of the historical evidences which exist in books and sculpture and whatever other remains we have of classic life could have enabled her to make us feel so thoroughly at home in the habitual existence of the Roman community in those far-off days, so entirely unlike the periods of modern civilization. For myself I should be quite content to enjoy the book merely as a romance and as a picture of life in the Imperial City even if no suggestion were made to us that the picture had been inspired by one who in some previous existence had actually looked upon the scenes and the people it portrays. The story is that of a

slave girl, Nyria, who had been a princess in some remote Germanic region and who was captured in her infancy by an invading force, carried off to Rome, sold as a slave in the Roman market, and purchased for continuous servile work by a proud, luxurious and selfish patrician lady, under whom she is capriciously subjected to much cruel ill-treatment. The girl grows up to be beautiful, is animated by the most pure and noble spirit, and finds her heart open to the influence of the Christian faith, then struggling against the tyrannical antagonism which meets it from the ruling classes and the ignorant populace of Rome. I do not propose to tell my readers the beautiful, picturesque and thrilling story, which they can learn for themselves in the pages of Mrs. Praed's novel. There is tragedy in the story and there are many painful scenes in it and the elements of terror are not wanting there, but I have no hesitation in saying that the abiding effect of the whole is elevating in the moral as well as in the artistic sense. If it were merely for the sake of becoming clearly impressed with a knowledge of what Roman life and Roman society were in the days of Domitian the book would amply reward any student, but it is barely just to say that the pictorial and dramatic accuracy which characterizes "Nyria" and makes it unlike most other novels is only one, and not even the very best, of the charms which it offers to the reading world.

I must return for a moment to politics were it only to express my hope that Mr. Philip Stanhope may be successful in the parliamentary candidature which he has just undertaken. Philip Stanhope was for many years a member of the House of Commons and won marked distinction there by the force and brilliancy of his style as a debater. He was never a mere party man, and he held advanced and enlightened views on great public questions. When the South African war brought the Jingoism of Great Britain up to a fever pitch and the General Election came on Mr. Stanhope, like many other men of ability and genuine patriotic feeling, lost his seat. Some vacancies have suddenly arisen of late, and I am glad to learn that Mr. Stanhope is offering himself as a candidate for one of the vacant seats. My American readers will probably know the result of the contest before these lines can come under their eyes,* but I am very glad all the same to have so timely an opportunity of expressing my hopes that my friend of many years may be enabled once again to give his services to the House of Commons. Mr. Stanhope belongs to a distinguished family and bears a name which might well be called historic, and he has ever shown himself worthy of the best traditions of his order. He is married to a Russian lady of rank, through whom he came into the ownership of a great landed property in Russia, on which he spends a large proportion of his time and his active interest. There are few living Englishmen so well acquainted with the general conditions of Russian life and society as Philip Stanhope, and he has often given me most interesting accounts of the difficulties which have to be incessantly encountered even by men of well-known name and influence in their dealings with the minute and complex tyranny of Russia's official despotism. Should Mr. Stanhope be returned to Parliament just now the event may, I hope, be taken as ominous of better days for the political life of the country when the General Election comes on.

* Mr. Stanhope was elected by a majority of 1,733.—EDITOR.

LONDON, ENGLAND.

A Northern Negro's Autobiography

BY FANNIE BARRIER WILLIAMS

[The three articles that we printed in THE INDEPENDENT last March called forth more replies than any articles we have recently published. We were obliged to reject all of them, however, except the following, which discusses a phase of the negro problem not touched upon by the three anonymous women, and often generally overlooked by the American people. This article therefore supplements the others, and the four taken together picture the negro problem from the feminine standpoint in the most genuine and realistic manner shown in any articles we have seen in print.—EDITOR.]

IN THE INDEPENDENT of March 17th last I read, with a great deal of interest, three contributions to the so-called race problem, to be found in the experiences of a Southern colored woman, a Southern white woman and a Northern white woman.

I am a Northern colored woman, a mulatto in complexion, and was born since the war in a village town of Western New York. My parents and grandparents were free people. My mother was born in New York State and my father in Pennsylvania. They both attended the common schools and were fairly educated. They had a taste for good books and the refinements of life, were public spirited and regarded as good citizens. My father moved to this Western New York village when he was quite a boy and was a resident of the town for over fifty years; he was married to my mother in this town and three children were born to them; he created for himself a good business and was able to take good care of his family. My parents were strictly religious people and were members of one of the largest white churches in the village. My father, during his membership in this church, held successively almost every important office open to a layman, having been clerk, trustee, treasurer and deacon, which office he held at the time of his death, in 1890. He was for years teacher of an adult Bible class composed of some of the best men and women of the village, and my mother is still a teacher of a large Bible class of women in the same Sunday school. Ours was the only colored family in the church, in fact, the only one in the town for many years, and certainly there could not have been a relationship more cordial, respectful and intimate than that of our family and the white people of this community. We three children were sent to school as soon as we were old enough, and remained there until we were graduated. During our school days our associates, schoolmates and companions were all white boys and girls. These relationships were natural, spontaneous and free from all restraint. We went freely to each other's houses, to parties, socials, and joined on equal terms in all school entertainments with perfect comradeship. We suffered from no discriminations on account of color or "previous condition," and lived in blissful ignorance of the fact that we were practicing the unpardonable sin of "social equality." Indeed, until I became a young woman and went South to teach I had never been reminded that I belonged to an "inferior race."

After I was graduated from school my first ambition was to teach. I could easily have obtained a position there at my own home, but I wanted to go out into the world and do something large or out of the ordinary. I had known of quite a number of fine young white women who had gone South to teach the freedmen, and, following my race instinct, I resolved to do the same. I soon obtained a situation in one of the ex-slave States. It was here and for the first time that I began life as a colored person, in all that that term implies. No one but a colored woman, reared and educated as I was, can ever know what it means to be brought face to face with conditions that fairly overwhelm you with the ugly reminder that a certain penalty must be suffered by those who, not being able to select their own parentage, must be born of a dark complexion. What a shattering of cherished ideals! Everything that I learned and experienced in my innocent social relationships in New York State had to be unlearned and readjusted to these lowered standards and changed

conditions. The Bible that I had been taught, the preaching I had heard, the philosophy and ethics and the rules of conduct that I had been so sure of, were all to be discounted. All truth seemed here only half truths. I found that, instead of there being a unity of life common to all intelligent, respectable and ambitious people, down South life was divided into white and black lines, and that in every direction my ambitions and aspirations were to have no beginnings and no chance for development. But, in spite of all this, I tried to adapt myself to these hateful conditions. I had some talent for painting, and in order to obtain further instruction I importuned a white art teacher to admit me into one of her classes, to which she finally consented, but on the second day of my appearance in the class I chanced to look up suddenly and was amazed to find that I was completely surrounded by screens, and when I resented the apparent insult, it was made the condition of my remaining in the class. I had missed the training that would have made this continued humiliation possible; so at a great sacrifice I went to a New England city, but even here, in the very cradle of liberty, white Southerners were there before me, and to save their feelings I was told by the principal of the school, a man who was descended from a long line of abolition ancestors, that it would imperil the interests of the school if I remained, as all of his Southern pupils would leave, and again I had to submit to the tyranny of a dark complexion. But it is scarcely possible to enumerate the many ways in which an ambitious colored young woman is prevented from being all that she might be in the higher directions of life in this country. Plainly I would have been far happier as a woman if my life up to the age of eighteen years had not been so free, spontaneous and unhampered by race prejudice. I have still many white friends and the old home and school associations are still sweet and delightful and always renewed with pleasure, yet I have never quite recovered from the shock and pain of my first bitter realization that to be a colored woman is to be discredited, mistrusted and often meanly hated. My faith in the verities of religion, in justice, in love and many sacredly taught sentiments has greatly decreased since I have learned how little even these stand for when you are a colored woman.

After teaching a few years in the South, I went back to my home in New York State to be married. After the buffetings, discouragements and discourtesies that I had been compelled to endure, it was almost as in a dream that I saw again my schoolmates gather around me, making my home beautiful with flowers, managing every detail of preparation for my wedding, showering me with gifts, and joining in the ceremony with tears and blessings. My own family and my husband were the only persons to lend color to the occasion. Minister, attendants, friends, flowers and hearts were of purest white. If this be social equality, it certainly was not of my own seeking and I must say that no one seemed harmed by it. It seemed all a simple part of the natural life we lived where people are loved and respected for their worth, in spite of their darker complexions.

After my marriage my husband and I moved to one of the larger cities of the North, where we have continued to live. In this larger field of life and action I found myself, like many another woman, becoming interested in many things that come within the range of woman's active sympathy and influence.

My interest in various reform work, irrespective of color, led me frequently to join hand in hand with white women on a common basis of fellowship and helpfulness extended to all who needed our sympathy and interest. I experienced very few evidences of race prejudice and perhaps had more than my share of kindness and recognition. However, this kindness to me as an individual did not satisfy me or blind me to the many inequalities suffered by young colored women seeking employment and other advantages of metropolitan life. I soon discovered that it was much easier for progressive white women to be considerate and even companionable to one colored woman whom they chanced to know and like than to be just and generous to colored young women as a race who needed their sympathy and influence in securing employment and recognition according to their tastes and ability. To this end I began to use my influence and

associations to further the cause of these helpless young colored women, in an effort to save them to themselves and society, by finding, for those who must work, suitable employment. How surprisingly difficult was my task may be seen in the following instances selected from many of like nature:

I was encouraged to call upon a certain bank president, well known for his broad, humane principles and high-mindedness. I told him what I wanted, and how I thought he could give me some practical assistance, and enlarged upon the difficulties that stand in the way of ambitious and capable young colored women. He was inclined to think, and frankly told me, that he thought I was a little overstating the case, and added, with rather a triumphant air, so sure he was that I could not make good my statements as to ability, fitness, etc., "We need a competent stenographer right here in the bank now; if you will send to me the kind of a young colored woman you describe, that is thoroughly equipped, I think I can convince you that you are wrong." I ventured to tell him that the young woman I had in mind did not show much color. He at once interrupted me by saying, "Oh, that will not cut any figure; you send the young woman here." I did so and allowed a long time to elapse before going to see him again. When I did call, at the young woman's request, the gentleman said, with deep humiliation, "I am ashamed to confess, Mrs. ———, that you were right and I was wrong. I felt it my duty to say to the directors that this young woman had a slight trace of negro blood. That settled it. They promptly said, 'We don't want her, that's all.'" He gave the names of some of the directors and I recognized one of them as a man of long prayers and a heavy contributor to the Foreign Mission Fund; another's name was a household word on account of his financial interest in Home Missions and Church extension work. I went back to the young woman and could but weep with her because I knew that she was almost in despair over the necessity of speedily finding something to do. The only consolation I could offer was that the president declared she was the most skillful and thoroughly competent young woman who had ever applied for the position.

I tried another large establishment and had a pleasant talk with the manager, who unwittingly committed himself to an overwhelming desire "to help the colored people." He said that his parents were stanch abolitionists and connected with the underground railway, and that he distinctly remembered that as a child he was not allowed to eat sugar that had been cultivated by the labor of the poor slave or to wear cotton manufactured by slave labor, and his face glowed as he told me how he loved his "black mammie," and so on *ad nauseam*. I began to feel quite elated at the correctness of my judgment in seeking him out of so many. I then said: "I see that you employ a large number of young women as clerks and stenographers. I have in mind some very competent young colored women who are almost on the verge of despair for lack of suitable employment. Would you be willing to try one of them should you have a vacancy?" The grayness of age swept over his countenance as he solemnly said: "Oh, I wish you had not asked me that question. My clerks would leave and such an innovation would cause a general upheaval in my business." "But," I said, "your clerks surely do not run your business!" "No," he said, "you could not understand." Knowing that he was very religious, my almost forgotten Bible training came to mind. I quoted Scripture as to "God being no respecter of persons," and reminded him that these young women were in moral danger through enforced idleness, and quoted the anathema of offending one of "these little ones" whom Christ loved. But he did not seem to fear at all condemnation from that high tribunal. His only reply was, "Oh, that is different," and I turned away, sadly thinking "Is it different?"

This still remains a sad chapter in my experience, even tho I have been successful in finding a few good positions for young colored women, not one of whom has ever lost her position through any fault of hers. On the contrary, they have become the prize workers wherever they have been employed. One of them became her employer's private secretary, and he told me with much enthusiasm that her place could scarcely be filled, she had become so efficient and showed such an intelligent grasp upon the requirements of the position. My plea has al-

ways been simply to give these girls a chance and let them stand or fall by any test that is not merely a color test.

I want to speak of one other instance. It sometimes happens that after I have succeeded in getting these girls placed and their competency has been proved they are subjected to the most unexpected humiliations. A young woman of very refined and dignified appearance and with only a slight trace of African blood had held her position for some time in an office where she had been bookkeeper, stenographer and clerk, respectively, and was very highly thought of both by her employer and her fellow clerks. She was sitting at her desk one day when a man entered and asked for her employer. She told him to be seated, that Mr. ——— would be back in a moment. The man walked around the office, then came back to her and said: "I came from a section of the country where we make your people know their places. Don't you think you are out of yours?" She merely looked up and said, "I think I know my place." He strolled about for a moment, then came back to her and said: "I am a Southern man, I am, and I would like to know what kind of a man this is that employs a 'nigger' to sit at a desk and write." She replied: "You will find Mr. ——— a perfect gentleman." The proprietor came in, in a moment, and ushered the man into his private office. The Southern gentleman came out of the office very precipitately. It evidently only took him a few seconds to verify the clerk's words that "her employer was a perfect gentleman."

It may be plainly seen that public efforts of this kind and a talent for public speaking and writing would naturally bring to me a recognition and association independent of any self-seeking on my own account. It, therefore, seemed altogether natural that some of my white friends should ask me to make application for membership in a prominent woman's club on the ground of mutual helpfulness and mutual interest in many things. I allowed my name to be presented to the club without the slightest dream that it would cause any opposition or even discussion. This progressive club has a membership of over eight hundred women, and its personality fairly represents the wealth, intelligence and culture of the women of the city. When the members of this great club came to know the color of its new applicant there was a startled cry that seemed to have no bounds. Up to this time no one knew that there was any anti-negro sentiment in the club. Its purposes were so humane and philanthropic and its grade of individual membership so high and inclusive of almost every nationality that my indorsers thought that my application would only be subject to the club's test of eligibility, which was declared to be "Character, intelligence and the reciprocal advantage to the club and the individual, without regard to race, color, religion or politics." For nearly fourteen months my application was fought by a determined minority. Other clubs throughout the country took up the matter, and the awful example was held up in such a way as to frighten many would-be friends. The whole anti-slavery question was fought over again in the same spirit and with the same arguments, but the common sense of the members finally prevailed over their prejudices When the final vote was taken I was elected to membership by a decisive majority.

Before my admission into the club some of the members came to me and frankly told me that they would leave the club, much as they valued their membership, if I persisted in coming in. Their only reason was that they did not think the time had yet come for that sort of equality. Since my application was not of my own seeking I refused to recognize their unreasonable prejudices as something that ought to be fostered and perpetuated; beside, I felt that I owed something to the friends who had shown me such unswerving loyalty through all those long and trying months, when every phase of my public and private life was scrutinized and commented upon in a vain effort to find something in proof of my ineligibility. That I should possess any finer feeling that must suffer under this merciless persecution and unwelcome notoriety seemed not to be thought of by those who professed t believe that my presence in a club of eight hundred women would be at a cost of their fair self-respect. I cannot say that I have experienced the same kind of humiliations as recited in the pathetic story of a Southern colored woman in

The Independent of March 17th, but I can but believe that the prejudice that blights and hinders is quite as decided in the North as it is in the South, but does not manifest itself so openly and brutally.

Fortunately, since my marriage I have had but little experience south of Mason and Dixon's line. Some time ago I was induced by several clubs in different States and cities of the South to make a kind of lecture tour through that section. I knew, of course, of the miserable separations, "Jim Crow" cars, and other offensive restrictions and resolved to make the best of them. But the "Jim Crow" cars were almost intolerable to me. I was fortunate enough to escape them in every instance. There is such a cosmopolitan population in some of the Southwestern States, made up of Spanish, Mexican and French nationalities, that the conductors are very often deceived; beside, they know that an insult can scarcely go further than to ask the wrong person if he or she be colored. I made it a rule always to take my seat in the first-class car, to which I felt I was entitled by virtue of my first-class ticket. However, adapting one's self to these false conditions does not contribute to one's peace of mind, self-respect or honesty. I remember that at a certain place I was too late to procure my ticket at the station, and the conductor told me that I would have to go out at the next station and buy my ticket, and then, despite my English book, which I was very ostentatiously reading, he stepped back and quickly asked me, "Madame, are you colored?" I as quickly replied, "Je suis Français." "Français?" he repeated. I said, "Oui." He then called to the brakeman and said, "Take this lady's money and go out at the next station and buy her ticket for her," which he kindly did, and I as kindly replied, as he handed me the ticket, "Merci." Fortunately their knowledge of French ended before mine did or there might have been some embarrassments as to my further unfamiliarity with my mother tongue. However, I quieted my conscience by recalling that there was quite a strain of French blood in my ancestry, and too that their barbarous laws did not allow a lady to be both comfortable and honest. It is needless to say that I traveled undisturbed in the cars to which my ticket entitled me after this success, but I carried an abiding heartache for the refined and helpless colored women who must live continuously under these repressive and unjust laws. The hateful interpretation of these laws is to make no distinction between the educated and refined and the ignorant and depraved negro.

Again, the South seems to be full of paradoxes. In one city of the far South I was asked to address a club of very aristocratic white women, which I did with considerable satisfaction to myself because it gave me an opportunity to call the attention of these white women to the many cultured and educated colored women living right there in their midst, whom they did not know, and to suggest that they find some common ground of fellowship and helpfulness that must result in the general uplift of all women. These women gave me a respectful and appreciative hearing, and the majority of them graciously remained and received an introduction to me after the address. A curious feature of the meeting was that, altho it had been announced in all the papers as a public meeting, not a colored person was present except myself, which shows how almost insurmountable a color line can be.

In another city I had a very different experience, which betrayed my unconscious fear of the treachery of Southern prejudice, tho following so closely upon the pleasant experience above related. I noticed, while on my way to the church where I was advertised to speak to a colored audience, that we were being followed by a half a dozen of what seemed to me the typical Southern "cracker," red shirt and all. I was not thinking of moonshiners, but of Ku-Klux clans, midnight lynching parties, etc. My fears were further increased when they suddenly stopped and separated, so that my friends and myself were obliged to pass between the lines of three so made. My friends tried to reassure me, but I fancied with trembling tones, but my menacing escort then closed up ranks and again followed on. Finally they beckoned to the only gentleman with us and asked him what I was going to talk about. He told them the subject and hastened to console me. When we got to the church and just before I rose to speak these six

men all filed in and sat down near the platform, accompanied by another individual even more fierce in appearance than they were, whom I afterward learned was the deputy sheriff of the town. My feelings are better imagined than described, but I found myself struggling to hold the attention only of this menacing portion of my audience. They remained to the close of the lecture and as they went out expressed appreciation of my "good sense," as they termed it.

This recital has no place in this article save to show the many contrasts a brief visit to the Southland is capable of revealing. It is only just to add that I have traveled in the first-class—that is, white—cars all through the South, through Texas, Georgia and as far as Birmingham, Ala., but I have never received an insult or discourtesy from a Southern white man. While, fortunately, this has been my experience, still I believe that in some other localites in the South such an experience would seem almost incredible.

I want to refer briefly to the remarks of one of the writers in THE INDEPENDENT with reference to the character strength of colored women. I think it but just to say that we must look to American slavery as the source of every imperfection that mars the character of the colored American. It ought not to be necessary to remind a Southern woman that less than 50 years ago the ill-starred mothers of this ransomed race were not allowed to be modest, not allowed to follow the instincts of moral rectitude, and there was no living man to whom they could cry for protection against the men who not only owned them, body and soul, but also the souls of their husbands, their brothers, and, alas, their sons. Slavery made her the only woman in America for whom virtue was not an ornament and a necessity. But in spite of this dark and painful past, I believe that the sweeping assertions of this writer are grossly untrue and unjust at least to thousands of colored women in the North who were free from the debasing influence of slavery, as well as thousands of women in the South, who instinctively fought to preserve their own honor and that of their unfortunate offspring. I believe that the colored women are just as strong and just as weak as any other women with like education, training and environment.

It is a significant and shameful fact that I am constantly in receipt of letters from the still unprotected colored women of the South, begging me to find employment for their daughters according to their ability, as domestics or otherwise, to save them from going into the homes of the South as servants, as there is nothing to save them from dishonor and degradation. Many prominent white women and ministers will verify this statement. The heartbroken cry of some of these helpless mothers bears no suggestion of the "flaunting pride of dishonor" so easily obtained, by simply allowing their daughters to enter the homes of the white women of the South. Their own mothers cannot protect them and white women will not, or do not. The moral feature of this problem has complications that it would seem better not to dwell on. From my own study of the question, the colored woman deserves greater credit for what she has done and is doing than blame for what she cannot so soon overcome.

As to the negro problem, the only things one can be really sure of is that it has a beginning, and we know that it is progressing some way, but no one knows the end. Prejudice is here and everywhere, but it may not manifest itself so brutally as in the South. The chief interest in the North seems to be centered in business, and it is in business where race prejudice shows itself the strongest. The chief interest in the South is social supremacy, therefore prejudice manifests itself most strongly against even an imaginary approach to social contact. Here in the Northern States I find that a colored woman of character and intelligence will be recognized and respected, but the white woman who will recognize and associate with her in the same club or church would probably not tolerate her as a fellow clerk in office or

The conclusion of the whole matter seems to be that whether I live in the North or the South, I cannot be counted for my full value, be that much or little. I dare not cease to hope and aspire and believe in human love and justice, but progress is painful and my faith is often strained to the breaking point.

CHICAGO, ILL

Literature

Driver's Genesis*

STUDENTS are to be congratulated on the appearance of this book, and intelligent Bible readers hardly less. It represents thorough scholarship, and in this respect ranks with the best, while in its attitude and in the proportions of its emphasis it fits the present situation in England and America as no other Commentary on Genesis does.

Canon Driver is an Old Testament specialist of great distinction. It is seldom that handbooks which appeal to the many speak with the authority accorded to him by all who know the situation. He has the faculty of being able to present questions and carry on discussions intelligently, without becoming superficial. This faculty makes his commentaries on Amos, Joel and Daniel the best volumes in the Cambridge Bible for schools, and this is one element in the value of the more elaborate book before us. Doubtless the book makes demands upon the earnestness and patience of those who use it—that is to say, it is a serious work, addressed to the mature and the trained of mind. But all such people can profit by it, even if they have not the specialist's equipment. At the same time the professional student will find in it all he really needs. For minute detail and for the history of exegetical opinion he may still resort to Dillmann, if he wishes to make himself an expert; for brilliant suggestion and bold advocacy of novelties he will still read Gunkel, but for steady trustworthiness, backed by ample knowledge, even the ambitious student will find nothing, in any language, better than Driver's Commentary.

The Introduction discusses the structure of Genesis, giving, with great perspicuity, and as much brevity as the subject admits, what almost amounts to an outline of the criticism of the Hexateuch. It treats next the chronology of Genesis, and a useful chronological table is prefixed. Then it takes up the historical value of Genesis, with special attention to the antiquity of man, to archeological discovery, to the personification of tribes and the individual existence of the patriarchs. Finally it considers the religious value of Genesis, discriminatingly, but with deep appreciation.

In the Commentary proper the text of the Revised Version is given at the top of the page, and the notes beneath—when important explanations do not make them overrun. Besides adequate discussion of the successive details, there is full treatment of such matters as the Cosmogony—with a long note on the Sabbath; the narrative of Paradise, with a note on the cherubim; the Deluge, with a sketch of the similar legends of various peoples, and the notable Chapter xiv. Excursuses on the names of God in Genesis and on the "Shiloh" of xlix. 10, with an index to the whole, end the book.

A further advantage of it lies in its temper, which joins positiveness of conviction with candor and respect for divergent views. Canon Driver's attitude throughout is one of carefulness, sobriety and fairness, tho never timid or vague. This appears at once in his exhibition of the discrepancies between Gen. i and the teachings of geology, of the mythological motive underlying Gen. vi, 2, of the combination of legend with religious teaching in the narratives of the Flood, of the difficulties and uncertainties attaching to Gen. xiv, to the destruction of Sodom and Gomorrah, and to various other parts of the narrative. His criticisms of apologetic views are sometimes severe, but never bitter. His views are definite, but need never give offense.

He does not forget that he is dealing with a writing held in high reverence, for he so holds it himself. He is, indeed, not issuing a book of homilies, or a book for devotional use, but a book to explain and interpret an ancient and revered document. Its religious significance is assumed and frequently touched upon, but not intruded. He writes as a religious man ought to write when the

* THE BOOK OF GENESIS. *With Introduction and Notes by S. R. Driver, D.D., Regius Professor of Hebrew and Canon of Christ Church, Oxford.* London: Methuen & Co.

theme is one requiring clear position, calm decision, full recognition of the facts, and the dispelling of illusions. The permanent religious power of the Bible depends greatly on the presence of this temper in its interpreters.

It results from Canon Driver's sound method, patient thoroughness and sober judgment that his results are generally solid. Some will think him over-cautious at various points, but this is a good fault in a book for students and the reading public. Its complement is the entire absence of vagaries which impair the worth of much Bible study in these untrammeled days. It is well to be reminded that nothing is certain till it is proved, and that hypothesis is not evidence. Those who really learn the lessons of this book will find themselves for the most part on very firm ground, from which they may, indeed, move forward, as light increases, but are not likely to be compelled to withdraw.

For these reasons the book is to be commended heartily to all who are interested in Genesis. It belongs to a series, entitled "Westminster Commentaries," under the general editorship of Dr. Walter Lock, of Oxford. If other volumes of the series approach this in value it will be worthy of a large circulation, and will be sure to have it.

A Manual of English Literature

As this work* now stands completed with the third volume it approaches pretty nearly the ideal manual of English Literature which the four volumes of Garnett and Gosse failed so signally to give us. Tho it is called modestly a revised edition, it is practically a new work. All the important articles, both the longer biographies and the general essays which link the parts together, are entirely new and are written by what would have been called, a generation or two ago, the best hands in England. Thus, in the first volume the history of the Old English, or Anglo-Saxon, period is by Stopford Brooke, who, however his enthusiasm for these crude beginnings may seem at times to overpass the bounds of critical judgment, has at least the singular faculty of giving life to things old and commonly forgotten. Chaucer and the Bible are by A. W. Pollard, an undoubted authority in those subjects. Shakespeare is by Sidney Lee, who has succeeded admirably in telling the poet's life and showing the development of his genius in the same narrative. The ballads are treated by Andrew Lang, and the essay on "The Civil War and the Commonwealth" is from the pen of the late Samuel R. Gardiner.

The second volume is no less noteworthy in the list of scholars who have contributed to its pages, opening as it does with an essay on "The Eighteenth Century," by Austin Dobson, in which that genial critic unrolls the literary progress of the age with even more than his accustomed cunning. In some respects the most admirable piece of writing in the work is the chapter on "The Nineteenth Century," which stands as an introduction to the third volume. In this essay Mr. Theodore Watts-Dunton has taken as his text the following quotation from the preface to his novel "Aylwin":

> "The phrase, the Renascence of Wonder, merely indicates that there are two great impulses governing man, and probably not man only, but the entire world of conscious life: the impulse of acceptance—the impulse to take unchallenged and for granted all the phenomena of the outer world as they are—and the impulse to confront these phenomena with eyes of inquiry and wonder."

Now, however much it may seem to us that Mr. Watts-Dunton errs in making this romantic principle the sole criterion of excellence in poetry, to the exclusion of all the other human faculties, it must at least be admitted that in his "renaissance of wonder" he has added a memorable phrase to our critical vocabulary. Nor, in calling attention to these special articles, is it fair to omit a due portion of praise to the many unsigned biographies, which are either entirely rewritten or much revised by the general editor and his assistants.

In one respect, and that almost the most important for the success of such an undertaking, Mr. Patrick has shown no little discrimination, and has erred only where a natural feeling of patriotism has entered to warp his judgment.

* CHAMBERS'S CYCLOPÆDIA OF ENGLISH LITERATURE. *New edition, by David Patrick, LL.D.* Three volumes. Philadelphia: J. B. Lippincott Co. $5.00 a volume.

In general, the apportionment of space has been fair and judicious. Only in the case of Scottish writers does it seem to us that he been over generous, with the result that more significant writers of the South have been crowded into too narrow limits. This is particularly the case with that long dreary stretch of Scotch literature from Chaucer's time to Elizabeth's, wherein Barbour and Dunbar and their ilk have been accorded considerably more space and weight than any English critic would be likely to grant them. In another important matter, the selection of illustrative extracts, the same good judgment has been exercised. Here and there, as is natural, some deduction must be made to this commendation. To mention a particular case, one would say that in the selections from Tennyson Mrs. Brotherton has been quite unfortunate in showing the weaker side of that poet and neglecting the stronger.

American literature, as is perhaps inevitable, is relegated to a separate section at the end of the third volume. This we are inclined to regret. By cutting off the great names of our country—Emerson, Hawthorne, Thoreau and Poe—from the general current of English literature a certain atmosphere of provinciality is thrown about them which works an undoubted injustice to their memory.

In going through these three bulky volumes we have noted a few errors of fact, but not so many as might be expected. As a whole, we do not hesitate to pronounce the work to be the most generally useful manual of English literature now in existence.

Electricity and Matter. By J. J. Thomson. New York: Charles Scribner's Sons. $1.25.

This little book gives in popular form the work which Sir Oliver Lodge compares to Newton's Principia in its epoch-making importance. It contains merely the six lectures given by Professor Thomson at Yale University on the Silliman foundation, but its theory is so comprehensive that it throws light on almost every branch of chemistry and physics. To its author we owe the conception and determination of the properties of the corpuscle, or atom of negative electricity, a thousand times smaller than the atom of hydrogen, and this hypothesis has served to explain and foretell much of the marvelous phenomena of the Crookes tubes and radio-active matter. According to Professor Thomson's theory the atom is not a little round, hard ball, as we used to think of it, but more complex than the solar system, consisting of a shell charged with positive electricity and inclosing gyrating constellations of negative corpuscles, or electrons, from a thousand to more than 200,000 in number. If some of these are jostled out of their sphere of influence they go wandering through the mass of matter, making it a conductor of electricity, while the corpuscles left must find a new state of equilibrium, in which process probably other corpuscles are expelled and the atom becomes transformed into another chemical element. The "bonds" which chemists have used to represent the valences connecting the atoms are regarded as identical with Faraday's tubes of force; so chemical affinity is the same as electrical attraction. The ether is fibrous with these electrical threads and along them light travels as a vibration. This book affords perhaps the only opportunity for the intelligent layman to become acquainted with these new conceptions of physical science.

The Imperialists. By Mrs. Everard Coates. New York: D. Appleton & Co. $1.50.

Yarborough the Premier. By Agnes R. Weekes. New York: Harper Bros. $1.50.

The Imperialists is founded upon Canadian politics, and the author shows an astute knowledge of that subject as well as of the social life involved. The hero is the champion of a more closely united and protected British Empire. In his advocacy of this idea he utters such representative sentiment as the following:

"And this republic that menaces our national life with commercial extinction, what past has she that is comparable? The daughter who left the old stock to become the light woman among nations, welcoming all comers, mingling her pure blood, polluting her lofty ideals until it is hard indeed to recognize the features and aim of her honorable youth."

Really, this is putting it rather severely for us! And who are the Canadians, any

way? However, it is a clever story, written in an excellent literary style and with less emotional weakness in the development of characters than women writers are wont to show.

A more interesting novel for the average reader is *Yarborough the Premier.* We have long been accustomed to the shad-bellied British romance that receives its extraordinary shape from the number of political problems it contains; but a book like this in which great statesmen carry on like the heroes in a dime novel is amazing. The Premier is a cheap scamp who believes in his powers of fascination as another man would believe in his genius. His virtue, his great distinction, consists in sacrificing personal honor for the honor of England. Upon one occasion he is made to stand against the wall in his own house while the leader of the opposition in the house shoots twelve times at him in the most dramatic, Western cowboy style, and he finally dies of his own accord with all his enemies bewailing the loss. The point is that the author has no intention of writing a burlesque on English character and politics.

Fifteen Years Among the Top-Knots; or, Life in Korea. By L. H. Underwood, M.D. Boston: American Tract Society. $1.50.

The Vanguard, a Tale of Korea. By James S. Gale. New York: Fleming H. Revell Co.

The Stolen Emperor. By Mrs. Hugh Fraser. New York: Dodd, Mead & Co. $1.50.

Now that all eyes are turned to the lands lying about the Japan and Yellow Seas, books upon Japan and Korea have an added interest. The market is flooded with hastily written volumes to meet the sudden demand caused by public interest in the Russian-Japanese War. The three books under review do not belong under the category of hack-written documents, as they were in the hands of the publishers before the war began. *The Vanguard* and *The Stolen Emperor* are frankly fictitious, altho we fancy the veneer of romance is very thin in the case of *The Vanguard,* and no doubt some good missionaries in Korea have already recognized their own portraits in the characters of the book. It impresses the reader as authentic. The missionaries and the native Koreans are very much alive, and likewise very much like other people. The ability to look at things from the native standpoint is rare among Anglo-Saxons, and Mr. Gale reminds us at times of Mrs. Steel in his sympathetic interpretations of the Oriental character. *The Vanguard* is not "Kim," but it is a remarkably interesting story. So is *The Stolen Emperor,* in which Mrs. Fraser takes us across the Japan Sea and back a few hundred years in history to the days of the Regent Hojo Yasutoke and the shadowy Emperor Go Horikawa, who was forced to abdicate in favor of his son, a year-old baby. The tiny Emperor and his mother are stolen by an unscrupulous and powerful noble from the North, and there is plenty of trouble in store for the characters of whatever rank who attempt a rescue. The pretty bits of description scattered through the novel are like water-color sketches, dainty rather than strong. Dr. Lillias Underwood's veritistic account of her fifteen years of experience as a medical missionary in Korea is more fascinating still, because it is true. The chapters upon the murder of the sweet-natured Empress and one upon the cholera epidemic of 1895, with its restrained pictures of courage and fidelity to duty among the American missionaries, are thrilling reading. Their services were recognized officially by the Korean Government. A wedding journey into the interior, where no white woman had ever been, and the insistent curiosity of the natives, some of whom had walked ten miles to see Mrs. Underwood, are graphically and amusingly described. The book is well worth reading by any one who wishes to understand the life of the people in what was "the hermit kingdom," but now focuses the world's attention. It is especially important as an authoritative rebuttal of the slanderous charges against our missionaries made by Angus Hamilton in his work on Korea.

Bred in the Bone. By Thomas Nelson Page. New York: Charles Scribner's Sons. $1.50.

"The title of this volume of Southern stories has been chosen not so much because of the first story as because all the stories are founded on traits of character which have appeared to the author to be

bred in the bone," says Mr. Page in his prefatory note, and he might have saved himself the trouble. Everybody knows by this time that he is the literary expounder of blood and pedigrees in this country. His imagination has been keening along this line for more than twenty years, and, if we are to take his opinion, the only bones worth having are the prenatally heroic ones got from a properly hall-marked ancestry. His best work consists in romantic demonstrations of this dogma. It is a dogma that will endure no other treatment, indeed! Thus the initial story in this volume is the account of a horse race, where the victory did not depend upon the training of the horse nor the skill of the rider, but upon their respective dams and sires. Bred as they were, they had to win, and one feels that they would have won against any field short of that over which Pergasus is suppose to run. And in this short space Mr. Page manages to intimate or demonstrate nearly every impulse that belongs to the hero bred Southern temperament, besides contrasting the old family darky, with the modern sophisticated negro. It is nothing to the reader of these stories that both are now exceptional types in the South. The art and the charm remain, and it goes without saying that this is one of the most delightful collections of short stories that has appeared this year.

Anthracite Coal Communities. By Peter Roberts, Ph.D New York: The Macmillan Co., 1904. $3.50.

Back of the great coal strike of 1902 were social, moral and political conditions of which the public have no adequate idea. While the ethnologist and the proofreader may have fun at the expense of this book, the citizen who wants to know from personal contact and close observation the entire social life and influence of the immigrant in America will find abundant material and accurate detail for the most serious study. When the writer ventures into the larger field of social philosophy he is amateurish, but when he shows what the Slav, the Italian and the Irishman are doing in school, in politics, in the church, in the saloon, he is convincing. It is altogether surprising that in this country, where the immigrant plays so great a part, there has been so little accurate investigation of the immigrants' processes of Americanization. A few books by social settlement workers and a few official statistics, but scarcely any minute and personal inquiry like that of Mr. Roberts, are in existence. His book should be most heartily welcomed and widely read and studied, for it gives us what we most need to know regarding a large and increasing class of people in America almost unknown. The book is so packed with important information that an adequate idea or summary cannot be given, but among the most interesting chapters are those on the standards of living and the educational systems. The writer concludes:

"If the coal companies that rent miserable houses to their employees were to abolish these as speedily as they could and build homes for their people that would secure domestic privacy—the foundation of morality; sanitary conditions—the mainspring of health; and comfort, convenience and attractiveness; and offer them for sale on favorable conditions, they would confer a far greater blessing upon their employees than any advance in wages or improved conditions ever can" (page 149).

The remarkable chapter on the educational systems of the anthracite region is the most disheartening in the entire story of gloom. It appears that the law of 1902 raising the age at which boys can begin work in the breakers is not enforced. The life of the child from infancy to manhood is vividly portrayed, and the small effect of the public schools is a revelation much needed by those who have placed their hopes on this instrument for the Americanization of the immigrant races. There are also striking accounts of the religious and superstitious life of the people and the enormous part played by the saloon. Every chapter has a positive and constructive value, showing not only the existing evils and problems, but the agencies which could be brought to bear to effect an improvement. Whatever judgment may be passed upon these portions of his work, there is not the slightest doubt that his painstaking and conscientious account of the actual situation is an invaluable foundation for serious upbuilding in the future.

Literary Notes

Brooks's "Social Unrest," which we reviewed last year (pages 335 and 2747), is republished by Macmillans in paper for 25 cents.

...."The Christ of Our Novelists," by Dr. H. W. Featherstun (Publishing House, M. E. Church South, 75 cents), contains twelve lectures on Christianity as presented in popular novels.

....The first number of the new quarterly issue of the Smithsonian Miscellaneous Collections contains a great variety of studies in anthropology, paleontology and zoology, well printed and illustrated.

...."How to Do Beadwork," by Mary White (Doubleday, Page & Co., $1.00), is a practical and convenient guide to this popular handicraft. The book contains many cuts of stitches and designs.

....The noble relief work of the Red Cross in Armenia, Cuba, Galveston and elsewhere is briefly and interestingly told by its founder, Miss Clara Barton, in the "Story of the Red Cross" (Appleton, New York, $1.50).

...."Buckle's History of Civilization in England" is published complete, with notes and introduction by John M. Robertson, in one handsome volume at the very low price of $1.50 by E. P. Dutton, New York.

...."A Mother's Manual," by Dr. E. L. Coolidge (A. S. Barnes & Co., New York, $1.00), is one of the best books we have seen for young mothers. It gives sensible and authoritative advice about the dressing, care, food and treatment of a child for each month of its infantile life, in language which any one can understand and no one can mistake.

....Recent issues of the "Temple Series of Bible Handbooks" (Lippincott, Philadelphia, cloth, 30 cents each), are "David; the Hero King of Israel," by Rev. W. J. Knox Little; "The Twelve Apostles," by George Milligan; "The Age of Daniel and the Exile," by Rev. A. Mitchell Hunt; "The Early Christian Martyrs and Their Persecutions," by the Rev. Prof. Herkless, and "Saul and the Rise of the Hebrew Monarchy," by the Rev. Robert Sinker.

Pebbles

We would hate to be a new baby, and have an old-fashioned woman look at us on a hot day and decide that we haven't on enough flannels.—*Atchison Globe.*

....Elihu Root, who has returned to the practice of law in New York City, has engaged a new office boy. Said Mr. Root: "Who carried off my paper basket?" "It was Mr. Reilly," said the boy. "Who is Mr. Reilly?" asked Mr. Root. "The janitor, sir." An hour later Mr. Root asked: "Jimmie, who opened that window?" "Mr. Lantz, sir." "And who is Mr. Lantz?" "The window cleaner, sir." Mr. Root wheeled about and looked at the boy. "See here, James," he said, "we call men by their first names here. We don't 'mister' them in this office. Do you understand?" "Yes, sir." In ten minutes the door opened, and a small shrill voice said: "There's a man here as wants to see you, Elihu."—*W. E. S. Fales in Boston Ideas.*

...."I cannot marry you!" It was a faultless summer day. In the distance could be heard the hum of the pleasure seekers who thronged the beach, while in front of them the limitless sea rose and fell with resistless grandeur. "Not marry me!" repeated the youth, who leaned bravely against the lonely rock that screened them from the others. "What, Gladys, can this mean? Have you not encouraged me all along? Have you not shown me in every way possible that you encouraged my attentions, and prompted by your invitation, did I not come all the way from Back Bay yesterday, so that I could tell you of my great love? And now you tell me that you cannot marry me! What means this sudden change? And when did you arrive at this conclusion?" The proud Boston beauty lifted her head haughtily. "This morning after the bathing hour," she said, with all the scorn of which she was capable. He turned beseechingly. "Tell me," he said; "what is it? What have I done?" She pierced him with her glance. "I could never marry any man," she said, "who wears a hired bathing suit."—*Puck.*

....Mrs. Lysander John Appleton had a death in her family recently, and, without any desire to abbreviate the hem of her mourning veil, or to raise any doubts as to the genuineness of her grief, *The Globe* wishes to express its opinion that she had the best time of her life. The crepe on her door: wasn't that a distinction? People turned to look at it; no other house in the neighborhood, or perhaps in the town, had crepe on the door. Then there was the subdued pleasure of taking in friends to see the body, the joy of whispering mysteriously, and the tear-soaked delight of exaggerating to intimate friends the number of floral offerings received. There was also a telegram or two, and she hopes the neighbors saw the boy deliver them. Mrs. Lysander John Appleton looks back at those black-bordered days with regret that she didn't make more of her opportunity. If she had only fainted at the grave, how nice it would have been; why didn't she think to run excursion trains to bring out of town friends to the funeral? How true it is, she laments, that Opportunity knocks only once at a door with a hearse out in front.—*Atchison Globe.*

Editorials

The Democratic Convention

Four years ago the Democratic party in its platform demanded "the immediate restoration of the free and unlimited coinage of silver and gold, at the ratio of 16 to 1, without waiting for the aid or consent of any other nation." Upon that platform, as upon the same declaration in 1896, it was doomed to well-deserved defeat. This year, altho its convention appeared to be controlled by conservatives, either gold standard men by conviction or "regulars" willing to abjure silverism for the sake of success at the polls, the party has declined—in committee by a vote of 35 to 15, and in convention with only two dissenting voices and without debate—even to recognize the establishment of the gold standard as an accomplished fact. We do not overlook the convention's message advising Judge Parker that he could accept a nomination upon its platform. But that did not place the party upon the side of the currency standard of civilization. It did not commit the party's representatives in Congress to the maintenance of that standard.

A great and an inviting opportunity was lost by the convention. Mr. Williams's currency utterance, accepted in its substance by the sub-committee, compelled no abject surrender of currency opinions previously held. It opened the way for easy transition from silver heresy to the solid ground of a gold basis. Pointing to the recent increase of the world's stock of gold, it asserted that this increase had "contributed to the maintenance of a money standard of value *no longer open to question*, removing that issue from the field of political contention." Every consideration of political expediency called for the insertion in the platform of as much as this, to say the least. Without giving notice that it no longer intended or desired to disturb the gold standard, how could the party expect to appeal successfully to the great States of the Northeast or to those of the Upper Mississippi Valley, where there was room for hope that recent pluralities could be reversed?

And yet, with delegates enough to give their candidate substantially two-thirds of the convention on the first ballot, the conservatives could not muster even a majority in support of a platform in accord with his views. The convention's committee dodged the entire question. And then the members of it, apparently rejoicing over work well done, asserted that they were "perfectly satisfied," Judge Parker's own representative adding that the empty platform was an "ideal" one.

We say an empty platform, for without a sane utterance upon the basis of the currency all other declarations of the platform lose a great part of such value as they otherwise might have. Here was the supreme test of the Democratic party in 1904. No one could reasonably expect the party to confess frankly that for eight years it had been in the wrong with respect to so important a question. But it could, without loss of self-respect, have shown proof of the possession of common sense by saying that the issue of the currency standards was a settled one, as, a generation ago, it was constrained to admit that the issues of slavery and secession had been settled for all time by the war. Judge Parker voted twice for silver and Bryan, but he says now: "I regard the gold standard as firmly and irrevocably established." The convention at St. Louis had only to say as much.

It declined to say it, not only in committee, and when the committee's report was accepted, but also again on Saturday night, after Judge Parker's telegram had been the subject of a conference. When the convention reassembled after that conference why did not some friend of Judge Parker move to amend the platform by restoring the paragraph that the full committee had cut out of it? Were not two-thirds of the delegates supporters of Judge Parker from the first? Could they not have cast a mere majority vote for adding the paragraph so clearly suggested by his message? To say that

they were unable to do what the situation so obviously demanded is to admit that the party was, in fact, still joined to its silver idols, and that a majority could not be found to fit the platform to the views of the nominee, then made public for the first time.

A vote upon the restoration of the currency utterance approved by the subcommittee could have been as easily taken then as a vote upon the reply to Judge Parker's telegram. The vote that was taken did not commit the party to the maintenance of the gold standard. It simply expressed the opinion that a man who regarded that standard as firmly and irrevocably established could accept a nomination upon a platform that with respect to the monetary standard was absolutely silent.

Silent, the reply said, because the question was not regarded by the convention as a possible issue in the campaign. But on account of this very silence and of the votes at St. Louis that caused it, the question becomes an issue once more, to our own great regret. It could so easily have been laid aside and buried, no longer to prevent free and unprejudiced discussion of problems that appeal to the people for solution. Judge Parker, a candidate of blameless life and high character, whose message to the convention must commend him to a host of Americans who knew him not, has been unfortunate in his political representatives and agents. They should have demanded an amendment of the platform on Saturday night, and they should never have consented to the nomination, for Vice-President, of a man whose fitness for the place was not shown while he was in the Senate, and who is now almost 81 years old.

The Platform

After noting in the new Democratic platform the absence of any declaration concerning currency standards, one naturally turns to what is said about the tariff and the Trusts. The Democrats "favor a revision and a gradual reduction of the tariff by the friends of the masses and for the common weal." Mr. Bryan procured the addition, to the subcommittee's draft, of the words: "We denounce protection as a robbery of the many to enrich the few." It is noticeable that the full committee excluded the subcommittee's conservative recommendation that in revising the tariff "existing conditions, however wrongfully, mistakenly, or unjustly brought about," should be "kept in view."

This caution was designed to convince the public that the party would not revise recklessly. It might well have been retained. Other parts of the tariff paragraph are sufficiently severe, but something was lost by excluding the subcommittee's reasonable disapproval of price discrimination in favor of foreign buyers and its promise that duties abused by combinations that so discriminate against American buyers should be reduced. By cutting out any reference to this practice of selling Trust-made goods abroad at prices much lower than those which our own people are required to pay for them, the full committee failed to point out what is quite generally recognized as an evil, and to take political advantage of the existence of it.

In its denunciation of Trusts and combinations that destroy individual equality of opportunity and free competition, and in its disapproval of transportation rebates and discrimination, the platform is within the limits of reason. It was Mr. Bryan that induced the committee to add the paragraph saying that any Trust that monopolizes any branch of business or production, and is engaged in interstate commerce, should not be permitted to transact business outside of the State of its origin. The remainder of the paragraph, relating to new legislation for such restraint, clearly refers to the bill prepared by Attorney-General Knox last year, and passed by the House, but ignored in the Senate—a bill withholding the privilege of interstate commerce from offending combinations. If Democrats and Republicans will unite for the support of this bill, perhaps it can be enacted.

The Philippines, says the platform, should be treated as Cuba has been. "It is our duty to make that promise now." No time is fixed for our withdrawal from the islands, but we should set the Filipino people "upon their feet, free and independent, to work out their own destiny." We prefer the policy of Secretary Taft, than whom the Filipino peo-

ple have no better friend, or one more familiar with their political capacity and needs.

The party favors "the maintenance of the Monroe Doctrine in its full integrity," but it would reduce the army, and the full committee rejected every word of a paragraph in which the subcommittee called for "the maintenance and a liberal annual increase of the navy, as our best defence against a foreign foe and a source of no possible danger to our liberties as a people." This was a blunder. We need a good navy if we are to maintain the Monroe Doctrine.

We believe that the election of Senators by the direct vote of the people, as advocated by the platform, is a reform much to be desired. We are glad to see that the party demands an honest, just and impartial enforcement of the principles of civil service reform. It has not heretofore been distinguished for its devotion to them. The general paragraph in favor of liberal "trade arrangements" with Canada and other countries might well have been made specific in support of reciprocity, and even of the Kasson treaties upon which a Republican Senate has refused to act. We cannot subscribe to the sharp partisan denunciation of the course of Mr. Roosevelt's Administration. In asserting all sorts of injustice and wrong in connection with the Panama Canal treaty, the committee appears to have forgotten that for that treaty almost exactly half of the Democratic Senators voted.

All good men "favor honesty in the public service." But it does not follow that the Republicans only desired to protect the guilty when they opposed a legislative investigation of the Post Office Department while the Government was engaged in detecting and punishing the thieves in it. There is no proof that there are "Executive Departments already known to teem with corruption." "Government by injunction" is not attacked under this name in the platform. This familiar question will be recognized with difficulty in an approval of a bill passed by the Senate eight years ago, "relating to contempts in Federal courts and providing for trial by jury in cases of indirect contempt."

The passages touching upon the race question and deprecating an alleged attempt of the Republican convention to "revive dead and hateful race animosity" are evasive and wide of the real question at issue. The white people of Southern States where a vast majority of the blacks have been disfranchised, now enjoy a greater measure of representation in the House and in the Electoral College than they are entitled to, in justice and by the rules of arithmetic. There should be an investigation to show how great this unjust excess of representation is. It may be that when the facts are officially ascertained and published the people of these States will give up that part of their representation to which they have lost just title by reason of their own deliberate acts.

Providence and Disaster

The falling of an apple was sufficient to call the attention of Newton to the force of gravitation. To get most people to notice this all pervasive and continuously acting force nothing less than the fall of a mountain would have sufficed. So we find that many people, in the ordinary course of their lives, have never found it necessary to consider such an every day fact as the existence of individually unmerited suffering in relation to their conception of a good and wise God until they are confronted with such appaling disasters as the burning of the Iroquois Theater and the "Slocum" steamer and the drowning on the "Norge" of a shipload of Scandinavian immigrants. Then the papers publish editorials headed "Where was God?" and fill their columns with letters of those whose feeble faith is disrupted by the catastrophe and those who offer timid excuses or endeavor to prove a satisfactory alibi for the Omnipresent. Many men have recently found that they must give up their faith in God—or enlarge it. But we can never find our "way out" by contracting our conception of the Deity. We need greater faith in God, or, rather, faith in a greater God; even, in so far as we can grasp it, in an omnipotent one. Instead of believing that God is less wise, less powerful and less benevolent than we had thought, we must study God's ways in the world more closely,

and then, unless the whole current of human thought changes its direction, we shall find he is better and greater and more incomprehensible than we had thought.

The savages early in the world's history perceived that God is powerful, but what an absurdly inadequate idea of the real power of the ruler of the universe the savage had compared with what we now know of it. Later men began to see some kind of connection between the happenings of the world, and they said "God is wise"; but what did they know of the wisdom of God and the order of the universe compared to that contained in the simplest school book? Later men traced some faint lines of cause and effect in the moral world, and they said: "God is just." They thought they were showing a wonderful appreciation of the justice of God when they compared him to an Oriental despot. It was, indeed, a great theological triumph, but our idea of justice has so far advanced that we want all the Oriental despots deposed, because they seem to us so unjust. Finally, very late in the history of religion, men dared think that God is good. They began to believe that, as Nietzsche says, "love is justice with unbandaged eyes." To power and wisdom was added love to complete the trinity. God the King, God the Judge and God the Father—these were the progressive similitudes; all true, all inadequate, because they are using the imperfect as a symbol of the perfect, and the part for the whole.

That God is all powerful, all wise and all loving cannot be completely proved, because the study of the universe as a whole and throughout all times alone could prove it. These propositions must be accepted by an act of faith, of projection of known principles into the unknown, just as in the case of every generalization, and in spite of inexplicable and apparently contradictory phenomena. On the basis of a few quantitative experiments, and those not carried out with perfect accuracy, scientists have come to put great faith in the laws of the conservation of matter and of energy, but they cannot explain by these principles a thousandth part of what happens around them every day. But they do not waver in their faith when they see apparent contradictions of them, such as the disappearance of a burning match or the stopping of a train of cars. So in regard to the wider generalizations of the wisdom, justice and goodness of God, resting, we believe, on much more evidence, and which therefore we hold to, even tho we are not able to explain Pompeii, Lisbon, Pelée, Johnstown, Galveston, Iroquois and "Slocum," as well as the numerous less striking but quite as puzzling events of daily life.

We are not among those good people who are always fearing lest God should do something to hurt his reputation. That reputation is, as we have briefly shown, better than it used to be a few thousand years ago, notwithstanding the inexplicable evil and suffering which we have seen and felt. But still we are continually finding that we have been limiting in our minds some of the infinite attributes of God.

The great error shown in the history of theology is the attempt to recast God in human molds. Being selfish, unjust, prejudiced and capricious ourselves, we want a selfish, unjust, prejudiced and capricious god for whom we can have a fellow feeling. The difficulty is that these gods which we create in our own image do not much resemble the real God as he is. The God many Church people believe in is one who would stop the chemical laws of combustion on a boat carrying a Sunday school, and allow to burn or even personally ignite a boat chartered by a Saloonkeepers' Association for a Sunday excursion. Doubtless many pious persons felt a sort of solemn joy in their hearts when a theater full of people burned in Chicago, because it seemed to them that their belief in the sinfulness of the ballet had received divine confirmation. But the Iroquois and "Slocum" disasters must be considered together to get a conception of a God who is no respector of persons.

There is, nevertheless, much truth in the old phases which called such a catastrophe "an act of God," "a judgment on us," a "punishment for our sins" and "a lesson to us." It is in a

sense all these. Those on whom the tower of Siloam fell were not sinners above all others, but there were certainly sinners in the vicinity, else the tower would have been kept in repair or people warned of its insecurity. Once people would have said that those who perished on the "Slocum" were guilty of some hidden crime; now we say the managers are guilty; some time we shall see that the blame must be more widely distributed. We put an impossible task on the jury to select one or more men to bear the whole responsibility. A scientist does not look for a cause, but for causes.

Who was to blame for the "Slocum" disaster? Why, all of us. Everybody who is responsible for the manifold conditions which, in combination, produced the catastrophe; every one of us who does poor work; who would fear a visit from a thorough inspector; all who have neglected their public, social and civic duties for their private interests; men who have shifted responsibility and "got out of things;" men who have neglected to study physics and chemistry or despised and laughed at those who devote their lives to the investigation of these laws of God; men who have kept their wives and daughters in tutelage, cultivating their timidity, to let their own petty bravery stand out by contrast; those who have taught that women need and should be weak, irrational and unable to take care of themselves; all who are selfish in their daily life and compel others to be so. Why should people be expected to stand aside and help each other in peril when they are trained by daily practice to jam to the front and elbow each other aside merely to get a seat in a trolley car, or to see a spectacle? We say it is our natural selfishness showing itself in such an emergency. It is not that so much as it is a cultivated selfishness, a necessary factor of our present civilization.

Doubtless some among the directors, crew and officers will be found "to blame," as we naïvely put it, and we shall endeavor to correct what seems to us the injustice of God in burning up the wrong persons by punishing these others. Since the innocent have suffered, we try to remedy the matter by making a few of the more guilty suffer also. It is probably the best we can do, with our present crude ideas of justice and of natural, civil and divine laws, but it is absurdly inadequate and unsatisfactory.

Selfishness is at the root of all our bad theology, as it is of our bad morals. Individualistic ethics is often at variance with social ethics. The rewards and punishments apportioned by divine justice to the human race for its obedience or violation (more accurately speaking, its utilization or neglect) of God's laws, moral, biological, physical and chemical, manifestly do not fall upon individuals as the recompense for individual acts. Possibly—tho it is a daring suggestion—we could introduce into our own juridical system some features of this method of administering justice.

The "Slocum" disaster, considered as a divine punishment, was a punishment of the whole community for the sins of the whole community. And the blessed thing about it is that it is beginning to be felt as such. All round the world, thanks to telegraphs and newspapers, people suffered. Men and women wept in San Francisco as in New York. Thousands of miles away the faces of men burned as if they, too, felt a faint reflex of the flames, and they choked as tho the salt water were in their throats. One of the greatest "lessons" is the solidarity of the human race; that "none of us liveth to himself and none dieth to himself."

A French View of the Woman's Congress

The report published in the Paris *Temps* of the International Congress of Women, which has just completed its session in Berlin, throws a side-light on the convention and its members, especially interesting since it confirms, what has always been our own private opinion, that the American women are the finest in the world. Naturally as a man, and still more naturally as a Frenchman, the reporter, M. Rémy, pays rather more attention to how the women looked than what they said, and he is particularly

struck by the fact that the women from the United States, where they are most emancipated, are the best dressed and the most graciously feminine in their manner. This ought to allay the fears of those who think that if woman is free to develop her own nature she will develop the nature of a man. At the opposite extreme he finds the German women affecting masculine styles or the shapeless garments of the clothing reformers. This is quite natural. The woman's rights movement is just beginning in Germany, and it begins there as it did here so many years ago with the attempt to throw off all tyranny, including the tyranny of fashion, instead of leaving this to the last. Now no man has yet secured the right to wear such clothing as he thinks is most comfortable, beautiful and hygienic, and it was very unwise of women, deprived of so many privileges possessed by the men, to begin by demanding more than the opposite sex had attained. As soon as the women moderated their demands to merely equal rights they secured them.

The woman who made the best appearance on the platform of the convention, according to M. Rémy, was Mrs. Terrell, of Washington, "a lady of Andalusian complexion," who in ease of manner, gracefulness and force of gesture and naturalness of expression was ahead of all the other "oratrices." Mrs. Terrell spoke in German with the same fluency and ease as in her native tongue. She is the daughter of slave parents and president of the American Colored Women's League. Southern ladies will now have to drop the Empress of Germany from their calling lists on account of her reception of this negress.

Among the other speakers to whom he devotes special attention is Mrs. Gilman, whom by an inexplicable anachronism he calls Mrs. Perkins. Her theory that the eternal feminine has led us on through all the stages of evolution and that the peculiar qualities which we call masculine were developed by the necessities of a transitional epoch of strife and confusion now passing away is, indeed, a startling one, but M. Rémy finds consolation in the assurance which the speaker was kind enough to give that the future state of society will not necessarily resemble that of the bees in the treatment accorded to its male members. Mrs. Gilman's views on the enlargement of the home we publish in this issue. Fraulein Helene Lange closed the convention with the prophecy that the coming *régime* will be neither masculine nor feminine, but that the *Uebermensch* of Nietzsche will be the most powerful individual, regardless of sex. This is quite in accord with G. Bernard Shaw, who makes the Superman in his recent play a woman.

We do not understand M. Rémy when he says that the seriousness and gravity of the Congress was scarcely enlivened by a single ray of wit. It is, of course, the conventional view that women have no sense of humor, but we have ourselves heard, and we may even say, felt, the wit of several of the ladies in our American delegation, and it hardly seems probable that crossing the ocean should deprive them of their power of ridicule or the inclination to use it. But perhaps Frenchmen, like Englishmen, cannot understand American jokes.

At any rate, woman herself is no joke, and if she is sometimes nowadays inclined to consider herself too seriously, it must be remembered that it is because in the past she has not been considered seriously enough by man. Women, like men, are entitled to just such rights as they are able to utilize to advantage, and what these are in both cases cannot be determined by history or theory, but solely by continuous experiment. It is a great thing to bring together in such a world's congress women from some European countries, who have no control over property or person, and women from some of our Western States, who have all the rights of the individual and of the citizen.

Our Inadequate Postal Service

THE Pennsylvania Grange is sending out interrogatories to Congressional candidates as to their attitude concerning a cheap parcels post. The Central New York Farmers' Club has passed a resolution demanding that this reform be placed at the very front of coming political action; and with it the establishment of postal savings banks. Postal reform is in the air, and it will not do for our political managers to overlook this fact. The farm-

ers of America are thoroughly well pleased with Free Mail Delivery. It has worked a marvel among the agricultural communities. It is one of the factors that have brought agriculture to the front—abolishing farm isolation. But the farmer perceives very clearly that the service so far is merely tentative. He feels the need of a parcels post even more than he needed a rural service for correspondence. His demand is growing imperative.

A system of local rates for free delivery service, similar to the German service, would be of immense value to the whole population outside of our cities; and with it a general parcels post such as is already established in every European State. A parcels post bill of this sort, drawn up by one of our leading manufacturers, was introduced into Congress last winter. It was indorsed by the Massachusetts House of Representatives, by California and by a large number of agricultural associations. It could not even get a hearing. Postmaster-General Payne announces that "the handling of merchandise by the post office is an infringement on express business," and tells us he shall oppose any extension of the present limitations. Even the extension of free delivery on the four-pound basis has been checked. There are nearly seventy-five thousand American towns and villages yet without any service at all.

A recent discussion of this subject by the Postal Progress League brought out facts not at all pleasant to be read by those who believe in equal rights and in economic progress. We are the only large nation in the world without a parcels post system. We are the only large nation whose postal service is conducted at a loss. The *Financier* adds:

"The United States pays the railways exorbitant rates for carrying mail; and the express companies, favored by lower charges, are actually underbidding the Government, and handling at a profit the cheapest forms of mail matter—on which, according to the postal authorities, the Government loses large sums annually. In this way competition becomes impossible; and the merchants of the country are losing millions of dollars annually in trade, which otherwise they might obtain."

The British Government is actually making a contract with a private United States express company to handle its postal parcels in this country; because the American postal department is too supine to undertake the work.

The editor of *The Open Court* adds that on several occasions it has had books, prepaid in post offices abroad, taken possession of in this country by an express company, postage stamps removed, and charges made for both storage and delivery.

"Recently a Tibet un-English dictionary, published by the British Government in Bengal, was forwarded to us by mail, postage fully prepaid (the Bengal Government had paid $2.25), and the package was held up at New York by the American Express Company, with a charge of $2.04 for entry fees, etc."

John Brisben Walker insisted, from thirty years' experience in postal matters,

"that a man like John Wanamaker, or Marshall Field, at the head of the Post Office Department, could, if given a free hand, organize a system that could carry any kind of mail matter profitably at one cent a pound."

Mr. Wanamaker, while in office, repeatedly insisted that he could see no reason why England and Germany should give better postal service than the United States. He did all that he could in the way of introducing rural free delivery, trolley car service and pneumatic tube service. He also endeavored to secure a parcels post, a postal savings bank and a postal telegraph; but he failed at these points. "Payment to the railroads is exorbitant," said this efficient servant of the public; a fact quite as patent to-day as when he was Postmaster-General.

For ten years E. F. Loud, of California, was chairman of the House Post Office Committee; and the position taken by him was that:

"Such business as the post office now does in carrying fourth class mail should be done by private enterprise. If I had my way, the post office would give no more facilities than it gives to-day—it would give fewer."

Mr. M. G. Cunniff, in a series of articles in *The World's Work*, sums up his argument in these strong terms:

"As the department is now conducted the service is inadequate, and has made no material advance in a decade, except the rural free delivery system. The department is administered with inefficiency, lack of economy and without appreciation of the increased needs of the country. The payment for the transportation of mail is practically what it was twenty years ago, while the cost of transporting other classes of matter has been reduced from one-third to one-half. The service given the public is in some ways even less liberal than it was ten years ago. The frauds and scandals are trifles compared with the loss and waste which are a daily burden upon Federal revenues."

It is well that the American public, especially our agricultural communities, are waking up to the real condition of affairs. The United States cannot afford to be left in the rear of civilization.

Schools as Social Centers

The consolidation of district schools into town schools, which began in New England, has now spread over the larger part of the whole country. The little wayside hovels, where school ma'ams taught the young idea how to shoot, are passing out very rapidly. This consolidation was entirely natural, because the town is the true social unit. It was so recognized by the Pilgrims, and the original school system of Massachusetts started with the town school. The district school was only a makeshift, connected with pioneering. The town school concentrates efforts, so that we have better buildings and better teachers. It brings the whole system of education under the eye of the people; it becomes a town affair. Experience shows moreover that, once inaugurated, there begins an era of steady improvement.

We have, however, over a large part of the country gone ahead without a full comprehension of the problem. Too many of our town schools have been planted close by the roadside, and are nothing more than a somewhat elaborate and convenient expression of the old-style education. The fact is that several new problems coalesce at this point, and must be considered together. Manual culture was grafted on to the high schools of St. Louis and other large cities thirty years ago. Our Agricultural Colleges and Experiment Stations stand for a most decisive industrialism. They are apparently the beginning of more complete State organizations on that basis. The Southern States had the advantage of entering upon a system of public schools at so late a day that there was little of the old classicalism to overcome. Looking our schools over, nothing is more apparent than that the hand has demanded and secured attention equally with the brain. Advanced educators insist that the school day shall be divided, so that one-half may be given to acquiring information, and the other half to applying it; half a day in the schoolroom, and half a day out of doors. If this theory be correct, then our new town school buildings must be placed in large areas of land, where the garden system can be applied.

Still another problem has met us, to be settled coincidently with the town school. It is clearly seen at last that the educational theories of the eighteenth century, as developed in the nineteenth century, did not cover the whole field. The object of the school is certainly to develop the individual, as the individual; but that is not the end of educational responsibility. The school must train the young for social relations and social duties; must teach not only manhood, but co-operation in the State. It is felt that in this direction our school evolution has so far come short. Mr. J. G. Phelps Stokes, in a very suggestive article in the current *Annals of the American Academy,* argues that the development of the social nature is fully as important as the development of intellectual power.

"Education of the head, in disregard of the moral or social sense, leads to the grossest crimes and to the most far-reaching injustice. There is, perhaps, no other form of immorality more disastrous in its effects upon the individual, and upon the community, than intellectual selfishness. Nearly every evil of which society and the individual are victims is traceable, directly or indirectly, to selfish acts, that the mere intellect of the offender excuses. Intellect, divorced from the social nature, is a dangerous tool."

We cannot touch the public school system to-day without a full comprehension that it must be readjusted for moral

and social ends. Based on this conviction, gradually grew into shape the idea of the public school as a social center. This means that at the school house shall center all the purposing of the community. The idea was a growth—a slow, and almost unperceived, but necessary evolution. We find it taking shape here and there, under the individuality of certain peculiarly independent instructors. Ossian J. Lang was perhaps the first to grasp the idea concretely, and express it as a general principle. He developed it admirably in a series of articles in *The School Journal*. The practical application has taken different forms in different parts of the country. Generally, wherever the town school has swept away or absorbed the district school there has been a perceptible increase of social school life. The movement in New York is attributed to Miss Winifred Buck, of the University Settlement, who secured permission to open boys' clubs in one of the public school buildings. This was in 1897, only seven years ago; and now in one hundred and twenty-eight of the public school buildings of New York City lectures are given and evening schools held, with concerts and musicales. The aggregate attendance at the informal lectures last year amounted to about one million and one-quarter of persons. In Public School No. 160 there were twenty-five clubs in session, the evening school classes meeting as a club every fifth night—that is, school four nights and club one night. That fifth night is given to recreation, games and informal social life. It is under the same wholesome government or influence as the four nights of school.

It is in this idea of the school as a social center that the whole modern evolution in education finds its completion. The school building becomes not merely a place for educating the young; it is the place where the whole community educates itself—adults, as well as children. It is not open simply for a few hours in each day and for one specific purpose, but during all the social hours it is open for social ends. From the mere standpoint of economy it is unwise to have a vast capital invested in land, buildings and equipments which can be used only five hours a day. Still stronger is the argument that by the proposed use of the school buildings it displaces evil forces. The tavern and saloon are displaced as centers of political and social influence. It follows that the school will be emancipated from that sort of political influence which has heretofore been so serious a hindrance to wise organization. The school superintendent becomes a much more influential factor in the community. He reaches not only the young, but the old; not only children, but parents.

So far the school building as a social center has been made the home of the games, the lectures, the concerts, the reading rooms, the evening lectures, and many other forms of community culture and innocent amusement. Mr. Stokes tells us that in one of the New York schools, during the summer vacation, "as many as fifteen hundred children may be seen swarming up six flights of stairs to the roof, where during the evenings they could play simple games, or dance to simple music," and, better yet, escape from the heat and evil associations of their homes. With them mothers and fathers are often seen, carrying their smaller children, to participate in the pleasures of the evening.

In the country the school center idea is fully as important as in the city. It is needed to restore the old town sentiment, and social sympathy and power of co-operation among good people. One of the worst features of our rapid pioneering has been the destruction of the town unit. In place of it has grown up the village community, with its store and saloon centers.

To sum up, it is the school and not the State which to-day is working a great revolution—a revolution that will involve not only the intellectual but the moral character of the nation.

A World's Congress

The article by Mr. Hayne Davis on the establishment of a world's congress which we published last week was such a notable one that we are glad to give our readers the following brief criticism of it by Prof. John B. Moore—perhaps the leading American authority on Interna-

tional law—who sends it to us in response to our request:

"Mr. Davis presents, in an interesting and eloquent manner, and with some novelty of detail, an idea which has been much discussed. A Congress of Nations, International Congress, or World's Congress, whichever it may be called, was a favorite project of the American Peace Society, which, at its first annual meeting, in 1828, offered a prize for the best essay on the subject. The amount offered was afterward increased, and forty or fifty essays were written. The most remarkable of these was the composite production of William Ladd, a distinctive feature of which was a plan embracing 'a Congress of Nations and a Court of Nations,' each independent of the other, the court to be 'permanent, like the Supreme Court of the United States, while the congress would be transient or periodical, with a change of members like the Congress or Senate of the United States.' Mr. Davis finds The Hague Tribunal in existence, and seeks to supplement it; Mr. Ladd proposed that a congress should first be created, and that it should create the court. The obvious defect in these plans is the lack of the executive power essential to all effective governmental organization. Mr. Davis indeed discloses this defect when he says that a debtor nation, if refusing to execute a decree of the court, would simply be involved in war, owing to its obstinacy, and, 'unless it won the victory,' would be placed in the debtor's prison, etc. But if the debtor nation happened to be the stronger it would probably win, and if its feeble creditor attempted coercion, might punish the latter for its rashness and take away its property and even its independence. Evidently, in order to insure justice, some form of international cooperation would have to be substituted for such a trial by battle."

An Injunction Against Ants

Government by injunction still continues to extend its scope, the latest being an injunction issued in a district court in Texas against the importation of the Guatemala ant for the purpose of destroying the boll weevil. Our readers are acquainted (see page 368 of the volume just completed) with the ravages of the boll weevil, which has caused a total loss of $125,000,000 to this country, resulting in the highest price ever paid for cotton and some disastrous speculation in the New York cotton exchange. Dr. O. F. Cook, expert in tropical botany of the United States Department of Agriculture, found that the plantations in Guatemala were kept free from the boll weevil by a variety of ants, who sting and kill them. He had now arrived at New Orleans with 89 glass jars, each containing a colony of ants, which it is proposed to put on the experiment station in Victoria, Texas. But a man who owns a farm near Victoria has secured an order from the court preventing the ants being turned loose in his vicinity, on the ground that they may do damage in many ways impossible to foresee. In this petition to the court he cites the importation of the English sparrow into this country, rabbits into Australia and many plants which have been introduced with the best of intentions into different localities, but which proved to be injurious weeds when they escaped from cultivation. Besides, the State has already too many ants of too many kinds. Probably the area covered by ant hills in Texas is equal to some whole States. The State of Texas, where the weevil began its work, offers a reward of $50,000 for a remedy.

A Wicked City

"The flood of iniquity in the city is at full tide, as seems natural during such a season. The temptation to sin and to become indifferent to the highest things of life is flaunted into one's face on every side. That many a young person—and some who are older—will go back to their homes with their finer sensibilities blunted, there can be little doubt. The Exposition is a great educator, but it necessarily brings with it much that is debasing in character."

The above quotation is from a circular letter sent us by "The Presbyterian General Assembly's Committee on Evangelistic Work." It will be perceived that it refers to the moral situation at St. Louis. In this connection we are reminded of the blameless maiden lady who, on her first and only trip to Europe, refused to disembark at Naples, but stayed on board for the two days the ship was in port. She had heard that Naples was a "very wicked city."

It costs the farmers of this country $950,000,000 a year—so the Agricultural Department at Washington tells us—to carry their products from their farms to the railroad stations. If they could carry twice as heavy loads it would cost but half as much. Then let us make better roads.

Insurance

Russia and State Life Insurance

NOTWITHSTANDING the war that Russia now has on her hands, recent advices from that country are to the effect that the Russian Government is to extend its system of State life insurance. Russia has for some time had in operation certain schemes of insurance, which have been carried out through the various savings banks. Something like 10,000 policies have been issued during the last four years, and the sum of all these is not far from $5,000,000. It is now proposed to make the taking out of insurance by railroad employees obligatory. The premiums will be deducted monthly from the wages received by the insurers. There is a tendency in certain quarters to regard the success of the Russian experiment as very problematical. Previous essays in similar fields, first in Great Britain and subsequently in New Zealand, would tend to give color to the existing pessimism in this regard. The Russian Government has despotic compelling power, and presumably it might compel every person under its jurisdiction to insure. In no other way, however, is it likely that the Russian State Life Insurance would be more likely to be successful, especially in competition with private companies, than have been similar schemes in other countries.

The "Glorious Fourth" and Its Casualties

THE celebration of the Fourth of July, 1904, was marked by something like four hundred minor accidents in New York City. According to the Chicago *Tribune* twenty-five lives were sacrificed throughout the country, 1,384 persons sustained injuries more or less severe, and property valued at $177,800 was destroyed by fires resulting from patriotic enthusiasm. It would seem that a safe and sane celebration of this National holiday might be substituted for one of which the cost seems excessive when it is counted up.

THE *Insurance Press* has just issued an Investment Directory for Insurance Companies and others. The volume contains a description and classification of bonds and stocks to the par value of about one and one-third billion dollars, held at the beginning of the present year by the insurance companies transacting business in the United States and Canada, together with a synopsis of the laws of the various States and Territories pertaining to investments. The compilation has been made by S. H. Wolfe, consulting actuary, of New York City. It is hard for the ordinary person to realize that there is so much money in the world as this book shows there must be. As a guide for those seeking investments, the book has considerable value.

....The National Association of Credit Men, whose annual convention was held in this city last month, has good reason for believing that every merchant should carry adequate insurance. It is a fact that fire insurance is a vital element in credit and that insuring companies should be solvent and responsible. The following resolutions will commend themselves to business men generally:

"*Resolved*, That whenever a member of this association is advised that a retail dealer is not insured, such member shall immediately report this fact to the national office, which shall thereupon endeavor, by correspondence or otherwise, to impress upon the dealer referred to the advantages of fire insurance, with a view to inducing him to carry such insurance; and be it further

"*Resolved*, That the Board of Directors be authorized and instructed to adopt the necessary means for carrying out the purposes of this resolution.

"*Resolved*, That the president of the National Association of Credit Men be authorized to appoint a special committee of seven, whose duty it shall be to consider means whereby merchants may be educated and influenced to carry adequate fire insurance; and that this committee be instructed to devise methods whereby united and concerted action on the part of the association's local branches may be obtained; and be it further

"*Resolved*, That this committee shall report to the Board of Directors, and if the report of the committee be approved by the board the plan adopted shall become immediately effective."

Financial

Trade with Japan

Reports from Japan say that commerce and industry there have not been seriously affected by the war. Business is transacted smoothly; factories enjoy their usual profit. The people appear to regard it as their duty to apply themselves to business with as much zeal and assiduity as are shown by their soldiers and sailors in fighting. Our own commerce with Japan for the fiscal year just ended was larger than last year's. Our exports to the islands were about $24,000,000 ($22,594,000 in eleven months, against $19,854,000 in the same months of the preceding year) and our imports from them were larger than ever before —$44,367,000 in eleven months, against $41,833,000 in the corresponding months of 1903. The exports would have been still greater if Japan had not turned from our high-priced cotton to the lower priced product of India. In 1900 the islands paid nearly $14,000,000 for American cotton; last year their purchases amounted to about $3,000,000. But our sales of manufactured products to Japan have been growing, notably those of wheat flour.

The taxes levied on corporations by New Jersey last year amounted to $2,436,910.

....Exports of manufactures in the fiscal year just ended were greater than in any previous year.

....The steel billet, structural steel, steel plate and steel rail pools held meetings last week and reaffirmed their prices.

....A syndicate of Mormon capitalists will build a railroad from Juarez to Ameca, in Mexico, under a concession obtained by John W. Young.

....Dun & Co. report that there were 6,214 commercial insolvencies in the first half of 1904, with $79,490,000 indebtedness, against 5,628 in the first half of 1903, with liabilities of $66,797,000.

....A New York syndicate has bought the Mt. Popocatapetl volcano for a price said to have been $500,000, on account of the sulphur deposits in the crater, which have been estimated in a Mexican report to exceed 100,000,000 tons.

....In June, 42,000 tons of steel billets, rails, bars and hoops were exported, against 36,000 in May and 30,000 in April. These exports are sold abroad at prices much lower than those which buyers in this country are required to pay.

....The Morristown Trust Company, of which Samuel Freeman is President and Aurelius B. Hull Vice-President, has resources of $8,122,844. Its deposits are $6,024,882,, capital $600,000, and surplus and profits $1,460,594.

....Contracts for the two projected tunnels under the Hudson River have been awarded by the Pennsylvania Railroad Company to American contractors; the four tunnels under the East River will be made by Pearson & Son, of London.

....Three railroads, the Cincinnati, Hamilton & Dayton, the Père Marquette, and the Chicago, Cincinnati & Louisville, are soon to be combined. The system will own and operate about 4,000 miles of road, with main terminals at Buffalo, Chicago and Cincinnati.

....Since March 14th, 1900, and under the banking law of that date, 2,018 national banks have been organized, with an aggregate capital of $116,389,300. Of these, 1,324 were banks capitalized at less than $50,000 under the authority first given by that law. In nearly every case the capital was $25,000, the average for the 1,324 banks having been $26,046.

....To meet trolley competition between Springfield and Greenfield, Mass., a distance of 40 miles, the Boston & Maine Railroad Company has reduced its rates, making them equal to those of the trolley lines. The reduction is more than one-third. For similar reasons the New York Central has reduced by 25 per cent. its local rates where its line is paralleled by the Auburn and Syracuse trolley road.

....Dividends announced:

The Rock Island Co., quarterly, $1.00 per share, payable August 1st.

U. S. Rubber Co., Preferred, 1½ per cent., payable September 15th.

The Independent

Vol. LVII NEW YORK, THURSDAY, JULY 21, 1904 No. 2903

Survey of the World

The Democrats and Their Ticket

Since the adjournment of the national convention at St. Louis, Judge Parker has remained at his country home in Esopus, where, up to the present time, only a few politicians have called upon him. The number of such visitors will be increased this week, when ex-Senator Davis, ex-Senator Hill, Senator Gorman and others will attend a conference there. The most prominent of his vistors last week were August Belmont, Bourke Cockran and Patrick H. McCarren. Mr. Hearst's papers publish sharp editorial attacks upon these men, warning Judge Parker against accepting their counsel or permitting himself to be associated with them in the public mind. Senator Gorman's friends say that he has declined to be manager of the campaign. It is reported that Mr. Belmont would like the office, and that it would be given to William F. Sheehan if he did not prefer to serve the candidate in some other way. Echoes of the recent convention are heard at Esopus, where reporters have written the story of Judge Parker's telegram. It appears that he had sent no telegrams or other messages to ex-Senator Hill, and that this telegram to Mr. Sheehan was the only message sent by him, directly or indirectly, to a delegate or the convention. Not until Saturday morning did he know that the Williams money plank had been excluded from the platform. Knowledge of the exclusion of it appears to have come to him in the reports of the New York Gold Democratic newspapers of that morning and in the editorials in which they deplored the situation and suggested that it was his duty to say something. In the course of a ride on his favorite horse he reached a decision, and the memorable telegram was filed at 11.30 a. m. He had retired at an early hour on Friday night, but on Saturday night he sat in his library with friends until he received, at about 3 a. m. on Sunday, the news of the convention's final action upon his message. It appears that in the course of the controversy in the full Platform Committee over the currency plank the question was referred to a special committee of three, consisting of Mr. Bryan, ex-Senator Hill and John Sharp Williams, and that in this committee Mr. Hill voted with Mr. Bryan. Full reports of Mr. Bryan's closing speech upon Judge Parker's telegram show that he charged ex-Senator Hill and other representatives of the Judge with bad faith, asserting that at his suggestion they had promised to exclude from the last paragraph of the platform the words "disregarding past differences upon questions no longer at issue," and had not kept their word. Mr. Cockran has published a long statement, explaining that he left St. Louis on Saturday in a despondent frame of mind, to avoid making a speech, because he felt that Judge Parker could not be elected, having no currency record, except his two votes for Bryan and silver; that when he reached Indianapolis he heard of the Judge's telegram, which completely changed the situation; and that, seeing then a splendid promise of victory, he hired a special train to take him back to St. Louis, where, to his disappointment, he arrived four hours too late to say anything to the conven-

tion.—The ticket and platform, as supplemented by Judge Parker's message, are acceptable to the Gold Democrats, as a rule, and are supported by the newspapers that represent them. An exception is seen in the case of the Chicago *Chronicle*, which is owned by John R. Walch, a banker who has opposed Bryan and his policies. That paper complains that a convention supposed to be controlled by conservatives permitted itself "to be bullied into wrong doing by a mere demagog:"

"A timid Eastern Democrat, who fondly imagined that he could be nominated as an unknown, has been placed on the ticket with an octogenarian free silverite from West Virginia and supplied with a platform which amounts to an indorsement of the platforms of Chicago and Kansas City. The Populistic West and the reactionary South are again in alliance, with a new leader, it is true, but with no change in principle and purpose."

Therefore announcement is made that the *Chronicle* goes over to the Republican party. The *Western Laborer*, published at Omaha and edited by Frank A. Kennedy, general organizer of the American Federation of Labor, supported Bryan in 1896 and 1900, but now gives notice in a long editorial that it will work for Roosevelt, saying that it can no longer follow Bryan in a party "which we have seen pledged to turn the Government over to a man who dared not state where he stands on public policy until after David Hill and other managers for Wall Street, the banks, Trusts and corporations had duped the party and stolen the nomination for him." Among those who sent hearty congratulations to Judge Parker were Mr. Cleveland, Mr. Hearst and General Miles. The last named said he believed the Judge would be elected and would have an opportunity to render "service of immeasurable value," because "Democratic institutions" were "in peril."—Democratic papers say that, owing to the nomination of ex-Senator Davis, his party will carry West Virginia and Maryland. Mr. Davis is a multi-millionaire, well known in both States, where he has large interests in connection with mines, railroads and banks. Senator Gorman is his cousin. Mr. Davis, who voted twice for Bryan, now says he is in full agreement with Judge Parker as to the currency. The "communistic sentiment" of the party, he adds, is gone, and the silver sentiment is "rapidly disappearing." His son-in-law, Senator Elkins, presided over the recent Republican convention in West Virginia, and remarked in his address that Mr. Davis "should have been named for first place, instead of a man without a record or business or political experience."

Mr. Bryan's Criticism and Protest

Two days after the close of the convention, Mr. Bryan published a long statement as to his position. For four reasons, he said, he felt justified in supporting the ticket. These were: Because it stood for opposition to imperialism; because Mr. Roosevelt was injecting into American politics the race question, which would tend to prevent a consideration of important economic questions; because Mr. Roosevelt stood for the spirit of war, while the Democratic candidates were for peace; and because the platform called for a reduction of the army. He then remarked that a Democratic victory would mean very little if any progress on economic questions so long as the party was "under the control of the Wall Street element." Nothing but the restraint of Democrats in Congress would prevent Judge Parker from going as far as the Republicans in enlarging the powers of the banks and in the use of asset currency. "The nomination of Judge Parker virtually nullifies the Anti-Trust plank." He awaited the Judge's letter of acceptance to find out "whether the laboring man has anything to expect from his election." The labor plank prepared by the Judge's friends had been "straddling and meaningless." He thought "some little progress on the tariff question" might be hoped for, altho the Parker men had been in favor of "a very conservative tariff plank." Mr. Bryan then said:

"Judge Parker stands for enough things that are good to justify me in giving him my vote, but, as I have tried to point out for several months, the triumph of the Wall Street element of the party denies to the country any hope of relief on economic questions. I have nothing to take back, I have nothing to with-

draw of the things that I have said against the methods pursued to advance his candidacy.

"It was a plain and deliberate attempt to deceive the party. The New York platform was vague and meaningless, and purposely so, because the advocates of Judge Parker were trying to secure votes from among the people who would have opposed his views had they known them. If he had sent to the Albany convention the telegram that he sent to the St. Louis conveniton, he would have had very few instructed delegates from the South and no possible chance for the nomination.

"But he and his managers adroitly and purposely concealed his position until the delegates had been corraled and the nomination assured. Then his friends attempted to secure a gold plank, which was overwhelmingly defeated in the committee, After the party had rejoiced over the harmony secured by the omission of the question, and after he had secured the nomination, he injected his views upon the subject at a time when he could not be taken from the ticket without great demoralization. The nomination was secured, therefore, by crooked and indefensive methods. But the Democrat who loves his country has to make his decisions upon conditions as he finds them, not upon conditions as he would like to have them."

He then gave notice that the fight on economic questions had been only postponed, not abandoned. "As soon as the election is over" he would undertake, he said, to organize for the campaign of 1908, striving "to marshal the friends of popular government within the Democratic party to the support of a radical and progressive policy" that should make that party "in the hands of the people an efficient means for securing relief from the plutocratic element that controls the Republican party and for the time being is in control of the Democratic party."

Beef Trust Workmen on Strike

A strike in all the packing houses of the Armour, Swift, Morris, Cudahy and other companies commonly believed to be associated in what is called the Beef Trust, was ordered for the 12th inst. by Michael J. Donnelly, president of the Meat Cutters' and Butchers' Union. At noon on that day 50,000 men quit work. Nearly half of these were in Chicago. Omaha, Kansas City, St. Joseph and other cities were affected; 3,000 men went out in New York. This movement is made in behalf of the unskilled workmen, whose wages had been reduced. It appears that the wage agreement relating to their pay expired on May 28th. They had been receiving 18½ cents an hour. The companies declined to renew the agreement, and reduced the pay to 17½ cents. By the union 20 cents was at first demanded, but when the strike was ordered the demand had been reduced to 18½. The companies offered to submit the controversy to arbitration, but not until the order for a strike had been issued. As the companies affected control the beef supply of the country, the strike has been widely discussed. Prices have risen, and it has been estimated that the beef on hand in New York and other large cities will last but a few days. The strike did not extend to the comparatively small independent companies, 22 in number, which are said to have been paying wages considerably higher than those about which the strikers complained. Non-union men were promptly sought by the employers, and before the end of the week several thousand of them were at work. In St. Paul, the strikers, on the 15th, would not permit even the clerks to enter the packing house, and the local authorities found it necessary to call for militia. In Chicago, on Sunday, four non-union men were attacked and beaten by a mob; in self-defense they shot one man and stabbed another. Negotiations for a settlement of the controversy by arbitration were interrupted on Saturday night. It had been agreed that all pending differences should be submitted to arbitration. The companies, however, insisted upon retaining their new non-union employees, while the union demanded that all the strikers should at once be restored to their old places. On Monday morning there seemed to be no prospect of an agreement. The number of non-union employees was steadily increasing, and in Chicago 14,000 men employed by the companies in the mechanical trades had decided to go on strike in sympathy whenever President Donnelly should ask for their aid.—A wage reduction of 12½ per cent. to be made on the 25th has been ordered in the cotton mills of

Fall River, where 25,000 employees will be affected by it.—At Milwaukee, there came before Judge Ludwig, of the Supreme Court, a suit by which an incorporated union sought to enforce a contract binding certain manufacturers to employ union men only. He decided that such contracts are void, being unlawful because they tend to create monopoly.

Excursionists Killed by Collisions

Two railway collisions that caused the loss of many lives are included in last week's record of casualties. On Sunday, the 10th, a long excursion train bearing the members of the Plattdeutscher Verein of Hoboken and their families to Greenwood Lake on the Erie road, about 40 miles from New York, was overtaken at Midvale, N. J., in the middle of the day by another excursion train. The first train had stopped a short distance beyond Midvale station to take water. Because it was hidden from view by a curve, and also because there was no restraining signal at the station, the following train ran against it. Altho this second train was moving at the rate of not more than 12 miles an hour, the two rear cars of the forward train were telescoped and smashed, being old and of very flimsy construction. Of the occupants of these cars, 16 were killed and 37 were seriously injured. The signals were not properly displayed (they had been out of order), and the brakeman sent back from the forward train with a flag contented himself with going only a few yards. Signal operator, flagman and conductor (of the forward train) have been dismissed.—On the night of the 13th, part of an excursion train, on which the members of the Sunday school of the Doremus Congregational Church in Chicago, with their parents and friends, were returning from a picnic, was wrecked near Glenwood, 23 miles south of the city, on the Chicago and Eastern Illinois road. Because a freight train was in trouble on the north bound track the excursion train was directed to take the other track for a few miles, in order that it might pass the obstruction. But the conductor of the freight, without orders, had moved a part of his train to this southbound track, where it was struck by the excursion train while moving at the rate of 40 miles an hour. The forward passenger coach was crushed by a baggage car that preceded it, and the second and third coaches were telescoped. A majority of the 21 passengers killed and the 70 injured were children. When the crash came they were singing hymns.

Municipal Affairs

The people of Memphis have risen in revolt against their municipal government, owing to the failure of the authorities to prove by their acts that they are enemies of vice and crime. On the night of the 11th two sheriff's deputies were killed during a raid upon a gambling house. Three days later, at a mass meeting attended by 10,000 people and addressed by prominent citizens, resolutions were passed demanding the resignations of Mayor Williams, Vice-Mayor Henderson and Chief of Police Mason. Five gamblers are in jail, charged with killing the two deputies. At times their friends, armed with rifles, have assisted in guarding them. They are to be tried this week, and Senator Carmack has volunteered to conduct the prosecution. On Saturday a Committee of Safety (fifty citizens) called upon the Mayor and addressed to him a series of questions, virtually asking him whether it was not true that he was false to his oath in permitting so many gambling houses and "dives" to exist in Memphis without being molested by the police. Similar questions were laid before the Chief of Police. The committee demands that the Chief shall be removed by the board that appointed him. This board has three members—the Mayor, the Vice-Mayor and the Police Commissioner. Probably the entire municipal government will be reorganized.—In Chicago the Union Traction Company has been directed to remove its tracks from certain streets, with respect to which its franchises have expired. The district thus affected lies in the heart of the city, and the Council will invite bids from persons who are willing to operate cars in it. Judge Grosscup advises that an average be made of the unexpired terms of the Union Company's franchises, and that upon this basis a comprehensive franchise be given in exchange for

them. Only in this way, he says, "can this generation come to a situation permitting it to own and operate" the city's railways.—The New York underground road, as far north as the Harlem River, will be turned over by the builders to the operating company on August 1st, and probably will be in public use a month later.

Countries South of Us

Constitutional amendments were recently adopted in Mexico providing for a Vice-President and making the Presidential term six years instead of four. On the 11th the Presidential election was formally completed. President Diaz was re-elected, and with him, as Vice-President, Ramon Corral, formerly Governor of Sonora and now a member of the Cabinet. It is expected that President Diaz will soon retire, owing to his age, or that he will test the ability of the new Vice-President, whom he seems to have chosen to succeed him, by visiting foreign countries.—Our Government's application of the Dingley tariff to the canal zone, and establishment of custom houses and ports of entry at Ancon and Cristobal, have excited much opposition in Panama, where the merchants declare that this action is at variance with the canal treaty and will ruin the commerce of Panama and Colon. It appears that goods for Panama have recently been landed at Ancon, where the French company made a deep channel leading to their wharves, and that local merchants fear that goods for the Republic must hereafter be landed by means of lighters in the shallow harbor. There is also objection to the imposition of a tariff on goods entering the zone. The Panama Republic has provided for the expenditure of more than $3,000,000 of its canal money upon public improvements, including capitol buildings, a library, a university, a school of arts, prisons, court houses, roads, bridges and lighthouses.—General Rafael Reyes, who came to Washington at the time of the Panama revolution, as he said, "to save something from the wreck," has been elected President of Colombia. The new Vice-President is Ramon Gonzales Valencia.—In the Cuban House a quorum has at last been assembled, owing to the conciliatory efforts of General Gomez. But before a settlement of the pending election contests the House will transact no business except that which relates to the pay of the soldiers of the Revolution. Contracts will soon be awarded for the equipment of the new Electric Power Company that is to utilize the power of Hababanilla Falls for a trolley system in Cienfuegos and a suburban road forty miles long in a district containing many rich plantations. This company will also supply electric lights for several towns.—In Venezuela, President Castro gives notice that the Government is about to sue the New York & Bermudez Asphalt Company for 50,000,000 bolivars (nearly $10,000,000), alleging that the company, by giving aid to the recent revolutionary movement, increased by that sum the cost of overcoming the insurgents.

England

The political situation in England continues much the same as it has been for some weeks. Mr. Balfour holds together a working majority, and by the use of the closure manages to get some perfunctory legislative work done in spite of the active obstructive tactics of the Opposition, which by trivial amendments, long debates and adroit questions is embarrassing the Government as much as possible. The Premier is attacked because two members of the Cabinet, Lord Lansdowne and Lord Selborne, have been elected vice-presidents of the new Liberal-Unionist Council, of which Mr. Chamberlain is president, notwithstanding the fact that Mr. Balfour professes not to be in full sympathy with the Chamberlain fiscal policy. This council assembled in London on July 14th with 1,800 delegates from all parts of the Kingdom and was addressed by Mr. Chamberlain, who expounded the two fundamental principles of the reorganized party, opposition to any further concessions to the Irish people and a complete reform of the British fiscal policy to enable the Government to meet hostile tariffs with equal weapons and prevent the "dumping" on England of

the manufactures of other countries, and to make preferential arrangements with the colonies. War Secretary Arnold Forster has made a statement of the reforms in the army proposed by the Government. No changes are to be made in the militia, artillery or cavalry. He proposed to reduce the regular infantry forces by fourteen battalions, leaving forty or fifty battalions for home service, after providing for India and the colonies. The army would be divided into two parts. A certain number of battalions would be kept at home. These would be reduced to 500 men, 400 of whom would be enlisted for two years' service, and would afterward enter the reserve for six years. These would be in reality territorial battalions, and the object of the short service system would be to build up the reserve. The volunteer establishment would be reduced to 180,000 men, and much larger grants would be made, so as to make the volunteers an effective force. From 15,000 to 16,000 regular troops would be kept at Aldershot, ready to take the field as a fighting force. Provision would be made for a permanent garrison of 21,500 men in South Africa. It appears that Mr. Arnold-Forster's proposal would result in a decrease of 8,761 men, leaving a total force of 227,000 and a decrease in expenditure of $2,450,000.—An arbitration treaty has been signed between England and Germany, which is similar in form to those concluded by France with other countries, and promoted by Baron d'Estournelles de Constant and other leaders in the international arbitration movement.—International visits are not confined to sovereigns, fleets and members of Parliament. A delegation of 300 British workingmen, representing clubs in all parts of England, spent five days in Paris recently. The party was met on its arrival by Baron d'Estournelles de Constant as president of the Arbitration Committee, and was received by President Loubet. Entertainments were given them by the British Ambassador and the Republican Committee of Commerce and Industry.—Paul Krueger, former President of the Transvaal Republic, died at Clarens, Switzerland, July 14th. The comments of the English papers are respectful and the Privy Council, presided over by King Edward, granted the request of the relatives of Mr. Krueger that his body be buried in the Transvaal.

French Politics

Premier Combes was again supported by his usual majority after the conclusion of the Chartreuse investigation. The committee appointed by the Chamber of Deputies to examine into the charges made by M. Combes in the heat of the debate, that the Carthusian monks had attempted by bribery to secure exemption from the law expelling the religious orders, was largely composed of his political opponents, but they were not able to discover any foundations for the rumors of corrupt practices. The report, however, condemned the monks for their calumination of the Government without proof, and also M. Combes for reviving an unfounded scandal. A motion declaring that the investigation disclosed no attempts at bribery and censuring all calumnators in general, but without mentioning names on either side, was substituted in the interests of the Cabinet and was carried. So far the Combes Ministry has met with no insurmountable obstacles in carrying out its policy. The Senate, after a bitter discussion of many weeks, passed by a majority of 59 the bill prohibiting the religious orders from teaching. This places the whole matter in the hands of the Government, for while ten years are allowed for the complete substitution of lay for Church schools, still the Government may now proceed at once to the suppression of such schools as it considers inimical to republican ideas. The bill reducing the term of universal military service to two years instead of three passed the Chamber of Deputies by a vote of 517 to 43. Since it has received important amendments in the lower house, it must now go back to the Senate, where, however, there is little doubt of its passing in some form, altho some of the more radical features attached to it by the Socialists in the Chamber may be cut off. The bill as it now stands is far more revolutionary than as first drawn by M. André, the Minister of War. Since it both reduces the burden of military service and equalizes by enforcing it on rich

and poor alike, it is a very popular measure, and its passage will tend to strengthen the Ministry. It is regarded by the Socialists as a step toward reducing the army to a mere defensive militia, removing all fears of foreign wars and setting an example to the world in the direction of concerted disarmament and universal peace. The French Parliament adjourned on July 13th without taking action on many important measures, among them the Income Tax bill and the revision of the extradition law asked for by our Government bringing bribery among the extraditable offenses.—The Pope is said to have threatened the punishment of those bishops who have republican sympathies. It is stated that Bishop Geay, of Laval, has been asked to resign at once, Bishop Nordez, of Dijon, has been suspended, and four other bishops ordered to come to Rome. The Minister of Public Worship has interposed to prevent these orders from being carried out, on the ground that it was a violation of the Concordat to remove the bishops without the consent of the Government. The Vatican has replied that these are merely disciplinary measures in which the state is not concerned.—The Chamber of Deputies voted unanimously to appropriate $3,700 for the establishment of a chair of physics in the Faculty of Sciences of the University of Paris. This is designed for M. Curie, whose investigations in radioactive matter have given him a world wide reputation, in which the French people take much pride.

The Russo-Japanese War

Another week of blind maneuvers and wild rumors. Samples of the latter are the reports of the death of Admiral Togo, of the fall of Port Arthur, the sailing of the Cronstadt fleet, the passage of Dardanelles by Russian war ships, the arrival at Cronstadt of an American submarine boat and crew, the invasion of Korea on the northeast by Russian forces, and the loss of 30,000 men by the Japanese in an assault of the defenses of Port Arthur on July 10th. The last mentioned was telegraphed by Viceroy Alexieff to St. Petersburg and was received with great rejoicing by the people. Its truth was stoutly maintained by the officials for several days, notwithstanding that there were no details or further confirmation, and it formed the basis of much speculation by the press experts in all countries. It is officially stated by the Japanese authorities that not a shot was fired on either side on the 10th or 11th. The Japanese seem to have made no progress in the direction of Niuchwang to the west of the Russian line, but whether this is because of the more important movements on the east requiring all the men or because General Samsonoff, as he reports, ambushed the Japanese column advancing along the coast in the direction of Yinkow, the port of Niuchwang, and killed and wounded a thousand men, is not yet known. Grand Duke Boris is recalled from the war because, as is reported, he spent his time in rioting with the women he had brought on his private train from St. Petersburg and when ordered to send them away by General Kuropatkin he struck him in the face with his sword. It will be recalled that the doings of Boris when in this country afforded the press much scandalous matter.

The British in Tibet

The three important events in Tibet during July are the holding of a durbar, the capture of the jong, and the beginning of the march toward Lhasa. The Tongsa Penlop, who is virtual ruler of Bhutan, arrived at the British camp before Gyangtse with the Ta Lama, members of the Supreme Council and representatives of the three great Lhasa monasteries, and a durbar was held on two successive days at which the Tibetan dignitaries appeared in gorgeous ecclesiastical robes of gold, scarlet and copper colored silk, and on the other side the British Commissioner, Colonel Younghusband, and the Military Commandant, General Macdonald, and their staffs, in full uniform. Both parties stated their positions and grievances, but no progress was made toward an agreement. Colonel Younghusband demanded the evacuation of the jong or fort which dominates the camp and the town of Gyangtse as a preliminary to further negotiations, but that request was not complied with. When the armistice had ex-

pired General Macdonald proceeded to the capture of the jong, which was defended by 10,000 Tibetans. By means of a heavy fire of all the guns a breach was made in the wall of the castle through which a party of Gurkhas entered, climbing up the precipitous cliff 160 feet above the plane with scaling ladders. The Tibetans abandoned the jong, the monastery and the town of Gyangtse when they found that the defense was in vain. The British loss was four killed and 30 wounded. Since the Tibetan Envoys showed no disposition to come to terms the expedition has started toward Lhasa, the capital, 140 miles distant, which it is hoped may be reached by August 5th.

Our Abyssinian Mission

The body of F. Kent Loomis, who was conveying to King Menelik the new commercial treaty and who disappeared from the steamer "Kaiser Wilhelm II." on its arrival at Plymouth, has been washed ashore at Kingsbridge, Devonshire, sixteen miles away. A wound was found under the right ear, but whether inflicted before death or after has not been determined. Mr. W. H. Ellis, who shared his stateroom, went on to Abyssinia with the treaty, and is now at Adis Ababa, the capital. The State Department has notified the King that Mr. Ellis has no official or diplomatic standing, and is proceeding to Abyssinia on personal business in which this Government has no interest, and with which it has no concern. The treaty was negotiated by Robert P. Skinner, Consul-General at Marseilles, and provides facilities and tariff rates for the transaction by Americans of business in Abyssinia equal to those granted to the citizens of any other country. The duration of the treaty is ten years.

Morocco

Mr. Ion Perdicaris is now in Paris urging the French Government to take strong measures to establish order in Northern Morocco for the protection of life and property in Tangier. Two French cruisers, "Letouche Treville" and "Du Chayla," are held at Toulon ready to proceed to Morocco in case of disturbance, and it is proposed to send forty French officers from Algeria to Tangier to take charge of the police force there. Mr. Perdicaris states that unless the war ships are at Tangier they are entirely useless, and that to send a small French force would be dangerous, because it would excite native animosity and not be sufficient to quell an outbreak. He advises a force of 10,000 men be sent to Morocco to demonstrate at once the power and determination of the French Government. If this is not done he suggests the next best thing would be to support Raisuli. He says:

"I know this will excite surprise, as the public has the idea that Raisuli is a common robber. This is entirely erroneous. I consider Raisuli to be the strongest man now available to deal with the turbulent conditions. While it would be an experiment, I am convinced that it would be better to try the experiment than to allow the situation to drift into complete anarchy. Raisuli says he can maintain order, and I believe in giving him a trial. This can be done by the foreign representatives joining France in upholding Raisuli's authority. I believe him to be seriously sincere. His taking me prisoner was part of a political movement, and the demand for a ransom was due to revenge for a series of persecutions against himself and family."

At a banquet given the Bey of Tunis during his visit to Paris, President Loubet took occasion to announce for the benefit of Morocco as well as Tunis and Algeria that France would scrupulously respect the religious traditions of Mohammedanism. M. Regnault, the new French custom house officer at Tangier, has arrived at his post, and, with a staff of French and Tunisian assistants, will have charge of the collection of the revenue on importations, by which the new French loan is secured. He will act as financial adviser to the Sultan. Owing to threats from Raisuli the work on the new custom house at Tangier has been suspended. He has taken up his residence at Zinat, an hour's ride from Tangier, and his followers continue to raid the villages in the vicinity and carry off cattle. According to his stipulations Kaid Benhirnaa, chief of police at Tangier, has been appointed Governor. The plan of M. Jaurés, the Socialist leader, for the "pacific penetration" of Morocco, instead of its conquest by force, has been adopted by the Committee of Foreign Affairs of the Chamber.

ALTON BROOKS PARKER

From a photograph taken July 4th, 1904

We printed a character sketch of Judge Parker in our issue of May 19th. This week we content ourselves with reproducing his latest photograph, leaving to subsequent issues further discussion of the man and his candidacy. Judge Parker was born in Cortland, N. Y., fifty-two years ago, and helped during his boyhood on his father's farm, thus early acquiring his fondness for country life. After his school days he taught school at Virgil, N. Y., for the purpose of earning enough money to attend a law school. From Virgil, at the age of twenty, he went to Rochester to teach and later entered the Albany Law School, working the while in the law offices of Schoonmaker & Hardenbergh, the daughter of the former of whom he subsequently married. After being admitted to the bar he drifted into politics, and from that time to this his rise has been very fast. He has served as Surrogate of Ulster County, chairman of the Democratic State Committee, and declined the Lieutenant-Governorship, the First Assistant Postmaster-Generalship, and the Governorship. He was appointed to the Supreme Court by Governor Hill at the age of thirty-four, and was renominated by the Democrats to succeed himself, the Republicans not even putting up an opposing candidate. In 1897 he was elected Chief Judge of the Court of Appeals. He has had two children, one a boy who died at the age of seven, and the other, Bertha, whose husband is Charles M. Hall, a young Episcopal rector at Kingston. Mrs. Hall has two small children, in whom Judge Parker takes great delight.

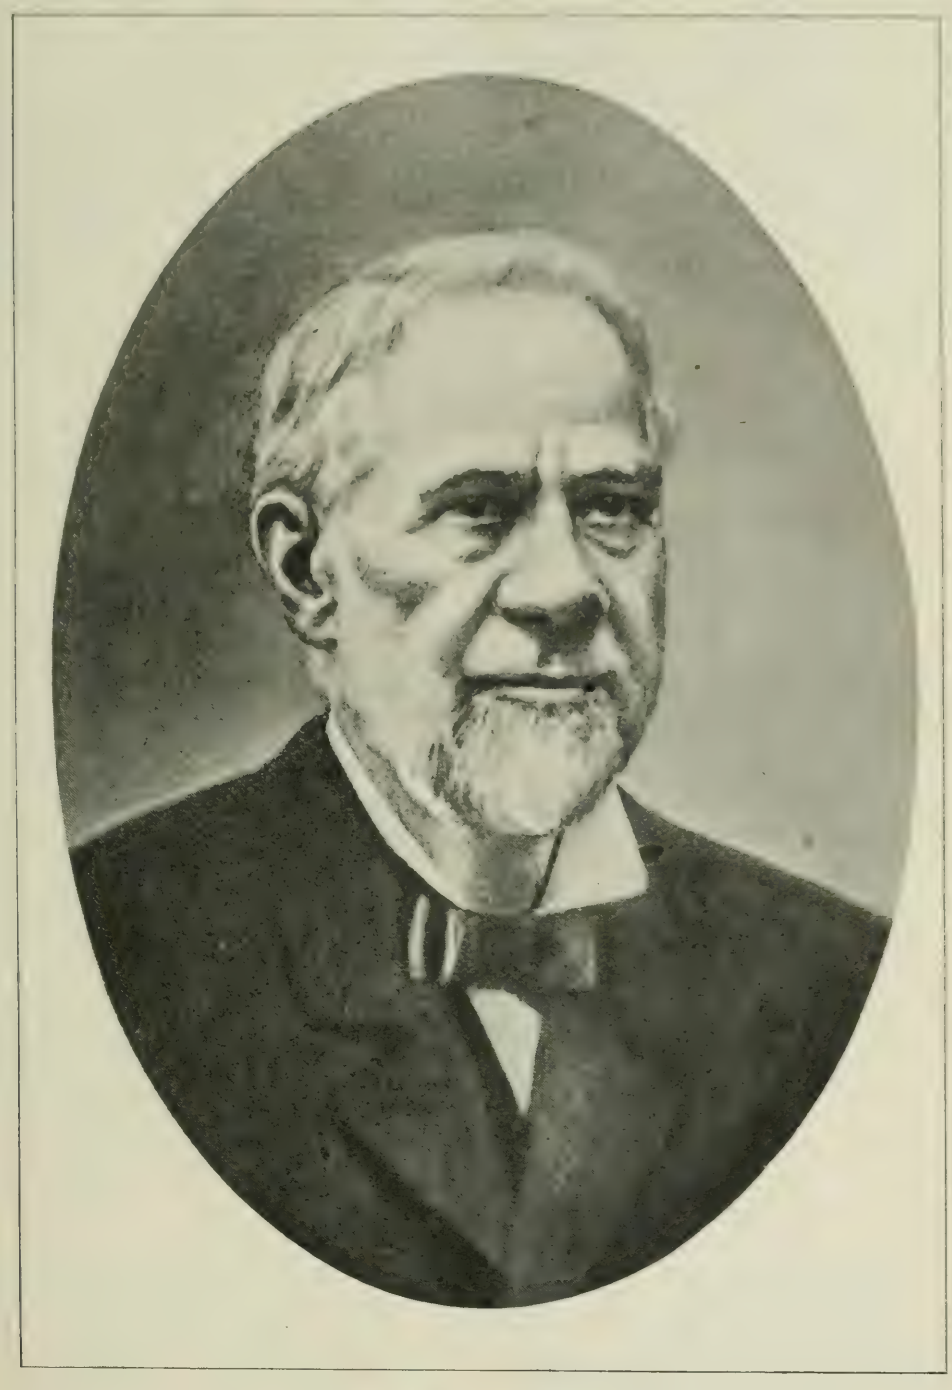
Henry Gassoway Davis

BY FRANCIS E. LEUPP

[There is no Washington newspaper correspondent who enjoys a higher reputation than Mr. Leupp, or who during his long service at the capital has made more friends among public men of both the great parties. He is said to stand nearer President Roosevelt than any other newspaper man, and his recent book, "The Man Roosevelt," is the standard biography of our President.—EDITOR.]

FROM railway brakeman to Senator of the United States is the story of Henry Gassoway Davis, of West Virginia, summed up in a single sentence. If a further promotion to the Vice-Presidency awaits him, it will add one more to an already astonishing list of proofs that America is second to none as a country of opportunity, and that an alert eye, a ready wit, a resourceful hand, steady habits and unfaltering courage in the face of difficulties are worth more to a youth than an inherited fortune.

Like his competitor on the Republican ticket, Mr. Davis began life on a farm. His education in books was meager, being confined to a few sessions at a village school in Maryland, from which he graduated, not into college or into a profession, but into railroading, and only the lowest grade at that. As a brakeman on the Baltimore & Ohio line he opened his battle with the world at twenty. The pay was small, and the prospect of advancement anything but flattering, but the young fellow was full of grit. Without any outward assumption of superiority over his associates, he nevertheless cherished in his heart the feeling that one day he should be paying wages, instead of receiving them. That idea he kept steadily in view till its realization came in due time.



Meanwhile, however, he did not allow his aspirations to interfere with his devotion to the task he had in hand. He made of himself the best brakeman in his division. When he got a chance to play the understudy for a higher functionary he seized it, and made the most of the duties he was called to perform. The officers of the company soon had their eyes on him. When an opening for a conductor occurred his name was the first to suggest itself. The same thing followed with a superintendency. Thus he advanced in rank and pay till he commanded an income which gave him his first thought of an independent career. The savings of his early years were scraped together and he bought an interest in a West Virginia coal mine and in a bank. He presently became president of the corporations which controlled both. The bank has since changed its name from the Piedmont to the Davis, out of compliment to the shrewdest man who has ever had charge of its affairs. He still remains at its head.

Mr. Davis was never too much immersed in business to take pleasure in politics, but his politics have usually had a distinct business phase. He entered the legislature first in 1865, and hammered at the shaping of State laws for five years, when he was called to the United States Senate, West Virginia having passed under Democratic control and the term of her Republican Senator Wiley having expired. He was reelected in 1876, and could have had another election in 1882, but did not care for any longer service, and retired.

As a private citizen, nevertheless, he has been called frequently into the public employ for purposes which would not consume all his time, but would exercise his peculiar talents. He was a delegate to the Pan-American Congress at Washington in 1889, and has been one of the most interested promoters of the Intercontinental Railway Company, becoming a member of the Government Commission having the matter in charge. Altho a Democrat, Mr. Davis was always one of the warmest friends of the late James G. Blaine, and a supporter of his foreign and economic policy in the main. He was a delegate to the national convention of 1868 which nominated Horatio Seymour for President, and also to that of 1872 which put the ill-fated Greeley

ticket into the field. The recent convention at St. Louis is, if I remember aright, the first in which he has sat for a generation.

Some surprise has been manifested at the choice by a great party, in a period which has been made historically memorable by its successions of Vice-Presidents to the Presidency, of a candidate as venerable as Mr. Davis, who had passed beyond his wage-earning stage and become a full-fledged man of business some years before Abraham Lincoln was nominated for the first time. The selection seems less astonishing to any one who knows Mr. Davis, as his Democratic colleagues do, than to a stranger. His octogenarianism is all on paper. The calendar and the family record make him an old man, but nature has kept him marvelously young in spirit, nerves and muscle. He looks, speaks, moves about and acts with an energy more commonly found in a well-preserved man of sixty. The most striking feature of his physiognomy is his nose, which is, as nearly

H. G. DAVIS

as nature could make it such, a right-angle triangle attached to his face by the hypotenuse. It is a pushing nose, an acquisitive nose, an inquiring nose, a nose which, set in one direction, will never cease going, and drawing its owner after it, till both reach their destination. The eyes supplement it, insignia of the same traits of character.

No man in West Virginia is so well known all over the State. It may be doubted whether he could call every man, woman and child in the population by name, but it would not be wholly unsafe to guess that there are very few of either class who do not feel sufficiently acquainted with him to address him freely in any place where they meet, for he is extremely democratic in manners. When he travels on the Baltimore & Ohio Railroad, which passes through his lifetime's field of labor, he enjoys a continuous levee from the time he boards the train till he leaves it. "How do you do, Mr. Davis?" "Good morning, Mr. Davis," "Why, Mr. Davis, it's a long time since I've seen you"—these are the rattling volley of greetings as passengers enter and quit his car. And the old gentleman is rarely at a loss for a response. If he cannot always remember the name of a fellow passenger, he usually manages to recall the fact that a brother once worked for him, or that a cousin lives in such-and-such a town, or something else which has enough of the nature of identification to answer practical needs. Not a few of the young folk who meet him call him Grandpa Davis, catching the title from the lusty sons of Stephen B. Elkins's brood, who derive the right to apply it through the maternal line.

Speaking of the Elkins boys recalls the fact that when they were little fellows, and Mr. Elkins was conducting General Harrison's campaign for the Presidency, they astonished their father one night by marching past his house at the head of a juvenile torchlight procession, with banners and transparencies bearing the portrait of the opposing candidate.

"Why, what's this?" exclaimed Senator Elkins, in a tone of amazement. "Is it possible that you boys don't know what General Harrison looks like?"

"That's not Harrison's picture," answered one of the youngsters, with malicious delight. "This is the Grover Cleveland Junior Campaign Club, and that's the portrait of our peerless leader."

"See here," roared the parent. "This will never do. Don't you know I'm a Republican?"

"*You* are, but *we're* not!" chorused the Elkins boys. "We're Democrats, like grandpa. He gives us a dollar whenever we ask him, and we're going in for a Democratic administration and good times."

WASHINGTON, D. C.

Eidola

BY JOSEPHINE PRESTON PEABODY

THEY have bidden me cast away
  Gods of the field and tree;
And the molded shape of clay,
  For an image that deceives.
    All the green things that be,
    Now they would have me see
  Nothing but leaves!

But I take not back my love;
  Not for the bidding thus!
And wide around, above,
  And little for eyes and ears,
    Life is still murmurous;
    Love, ever near to us,
  Everywhere hears.

And the gods that have been of old,
  And the thousand gods that be,
Seeking thy thousandfold
  Answer, forever sought,—
    Images strange to see,
    Striving to image Thee,
  Are they as naught?

Speak to us, All and One!
  Only man's heart is hard.
Which little god undone,
  Shattered before thine eyes,
    Beautiful, sorry, marred,—
    Which little longing shard
  Wilt thou despise?

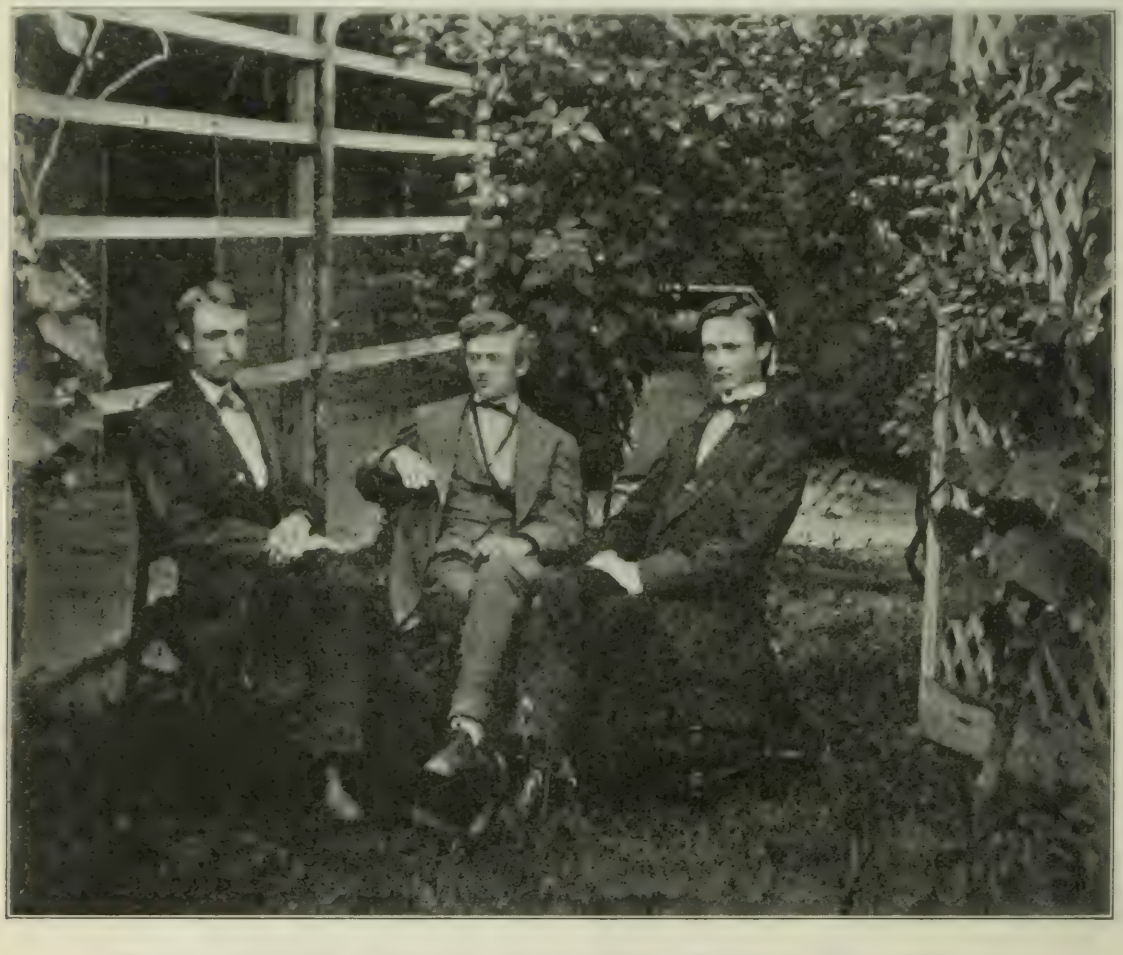
CAMBRIDGE MASS

Senator Fairbanks—The Boy and Man

BY E. I. LEWIS

[Mr. Lewis is one of the editors of the Indianapolis *News*, and is therefore a fellow townsman of Senator Fairbanks. The pictures that accompany this article were furnished by the Fairbanks family, and are probably impossible to duplicate.—EDITOR.]

THE log cabin statesman has not passed yet, tho in the very nature of things, and principal among them the elimination of the log cabin by the clearing of forest lands, the day is nearing when the democratic American mind will not be able to trace greatness back to such humble homes. "From the log cabin to the White House"—how long has that summary of successful lives stood as exemplifying possibilities in this land, where children are not born to class or caste.



In the nomination of Charles Warren Fairbanks, the senior United States Senator from Indiana, for the office of Vice-President, the Republicans again have gone to that source of so much greatness—the Ohio cabin. It was only May 11th, fifty-two years ago, that a boy was born in a little single-room log cabin in a half-acre clearing on one of the bluffs overlooking the picturesque Big Darby Valley in North Central Ohio, and it was this boy that became the man whom the Republicans at Chicago nominated for Vice-President. When he reached the climbing age in that cabin, he went to bed in the loft, reaching it by the crude ladder from the living room. When, "barefoot boy with cheeks of tan," he had passed the chores-doing years, he helped to clear the forest, he tilled the soil and harvested the crops in the spring, summer and fall and went to the old district school in the winter. He studied at night before the great open fire place, while the meals were being cooked on the cranes and in the baking pans. He started to college with only $41 and one suit of clothes, and there "bached" and worked his way to graduation with honor. He became an Associated Press correspondent with day work and attended law schools at night. Thus he gained admittance to the bar, and by the same methods of industry soon became one of the best known railroad lawyers in the country. He was honored by his adopted State with one of its seats in the United States Senate. If the Republican party is successful next fall, another typical career from the log cabin to the Capitol will have been

rounded out—or, perhaps not, for already enthusiastic admirers say the greatest gift of the nation awaits him.

Back in the Cromwell days in England the Fayerbankes fathers were arrayed against the crown. It was about twelve years after the town of Boston was laid out that this Revolutionary stock was transplanted to American soil in the person of one Johnathan Fayerbanke, who, with his wife, four sons and two daughters, protested not only against the crown, but also against religious and political restrictions. This Johnathan Fayerbanke and his family, judging from all accounts and records, were sturdy people. Coming from the yeoman class and being Puritans, the American branch of the family took its place in the new world without any great ostentation. The head of this family was a hard headed man, who had determination and convictions. Nothing better illustrates some of the traits of his character than this church record:

"Johnathan Fayerbanke, notwithstanding that he has long stood off from ye church upon some scruples about publick p'fession of faith and ye covenant, yet after divers loving conferences with him, he has made such a declaration of his faith and conversion to God, and such p'fession of subjection to ye ordinances of XT, and this Xyt he was readily and gladly received by ye whole church 14d—6m—1664."

At all events this old Johnathan Fayerbanke became such a force and established such a good reputation that his old home in Dedham, built in 1636, today is one of the shrines of the Massachusetts Historical Society. In that seventeenth century, and the one following, the Fayerbanke family—in that time abbreviated to Fairbanks—became well known not only in Massachusetts but also in Connecticut and in New Hampshire.

Senator Fairbanks at Twenty. Taken When Graduated from College

In the seventh generation one Loriston Monroe Fairbanks, born in Connecticut, and put to work early in the woolen mills at Ware, in Massachusetts, was caught in the great Western movement, which landed him, in the beginning of the nineteenth century, in the Ohio country. North of the village of Spring-

field he built a wagon making shop and for a number of years he worked at his trade. It was in those years that he met one Mary Adelaide Smith. Mary Adelaide, like Fairbanks, came from sturdy stock, a New York State branch of the numerous Smith family. Like Fairbanks, her people believed implicitly in at least two things—Methodism and the abolition of slavery. They were married, and this marriage was blessed with ten children, of whom Charles Warren Fairbanks, present United States Senator from Indiana and the Republican Vice-Presidential nominee, is the oldest living.

The health of the wagon maker gave way a few years after the marriage and he found it necessary to close his shop and get out into the open air. This he did, and it led him to the purchase of a tract of land in the Big Darby country, a few miles further north, and there, near Unionville Center in Union County, on a knoll overlooking the picturesque valley, he made his clearing, built his log cabin and planted his fig tree, and it was while thus living the humble life of the frontier farmer that there came into the little log cabin a boy. It has been said that he was cradled in a sugar trough, but the mother, who still is living in Springfield, where four years ago she buried her husband, says this is a mistake. "We had many sugar troughs on the place," she said, "but I believe that Mr. Fairbanks provided a better cradle than that." At all events the beginning was humble and Mrs. Fairbanks to-day takes great pleasure in telling of those pioneer days when the barefooted boy fell heir to all of the duties of a farm hand. Few people live near the Fairbanks home now that lived there during those early years of the boy's life. The few that knew him recall him as a long, lean, lank, hard working young man who, in bare feet, encouraged crops with old farm horses hitched to cultivators, and who took an active hand in all of the farm work, and who, in the winter, trudged a mile and a half back country to a district school instead of crossing the half mile of meadows to the Unionville Center town school.

"We were very fearful of town influences," said Mrs. Fairbanks, a few days ago, "and we sent our children to

The Robinson District School House, Where Senator Fairbanks Attended School

the district school. I remember that it was with grave misgivings that we hitched up and drove with Charles to Delaware, when he entered college. We were not certain what would be the influences there and were afraid that, like so many country boys, he would not be able to withstand the temptations of town or city life. We were very uneasy, tho members of a neighboring family would drive up to see him every Saturday, and this uneasiness continued until we received a letter from Charles one day something like this:

"'DEAR MOTHER: To-night I had to disobey

The Old Meeting House in Union County, Ohio, Where Senator Fairbanks as a Boy Went to Sunday School

The Fairbanks Family Ten Years Ago on Their Illinois Farm

your instructions to stay off of the streets at night. When I came to my room to-night I found that there was no oil in the can, and I had to go down to the grocery to get some.'

That letter set our minds at rest, and we knew that the town influences were not corrupting our boy."

But before those interesting college days an interesting event in the life of the lad must not be overlooked. Having qualified with high degrees in statesmanship by having been born in an Ohio log cabin, at the age of 4 years young Fairbanks removed all trace of that qualification and came near ending his career in doing so. The crops had favored the Fairbanks family and it was decided that a new house, a two-story home on the "homestead" plan, should be erected. The senior Fairbanks left a pile of shavings in the log cabin one day after he had been at work there. The young Charles, with an eye for neatness that has always characterized him, thought he would clean up the room. But in carrying the shavings from the pile in the center of the room to the fire in the big open fire place he left a trail behind him. This the fire quickly spread and in a few minutes the little home was in flames, and an hour later was a smouldering mass. The door of the cabin was closed and never before had the lad been able to reach the latch, but, by some miracle never explained, he managed to get the door open and escaped burning to death. The new home was occupied in haste under these conditions and it is the one that still stands and is known to-day in Union and surrounding counties as the Fairbanks Homestead. But shortly after the new house was occupied lightning tore its way through the part of it set aside for the children, and all of them, including the present Senator, had a very narrow escape from death. They were in bed and escaped with a severe shaking up.

By the time that young Fairbanks had reached the age of fifteen he had saved $41, and with this and one suit of clothes he started away from home to round out

his education. With a neighboring boy he went to Delaware, Ohio, where they entered the Ohio Wesleyan University, from which, four years later, he was graduated. But the $41 had to go a long way and young Fairbanks and a neighborhood boy, who went to college with him, rented an attic. They knew how to cook eggs, boil potatoes and make batter cakes, and on this fare—largely batter cakes—which supplemented a basket of food sent from home every Saturday, they existed. But Charles's treasury had to be filled by other funds and to earn the additional money he turned to account his knowledge of tools and worked for carpenters on Saturdays. At first he was turned aside by the white contractors and he takes considerable pride to-day in relating that his first employer on those Saturdays was a colored contractor and that all of his fellow workmen were colored men. That he should accept employment under these conditions is not strange when it is remembered that his parents were Methodists and abolitionists. That combination in those days meant a great deal. It is told that the elder Fairbanks had a colored man working for him on the farm and this colored man, being clean and respectable, ate at the family board. On one occasion, when harvesters were at the Fairbanks home, one of the hands employed by a neighboring farmer refused to sit down at the table with the colored man. "Ah, very well," said the head of the house, "I never require any man to eat with a colored man. Mother, please set a table over near the window for Mr. ——," and the exclusive farm hand ate by himself, while the others and the colored man laughed and ate at the family table. It is doubtful that this will be regarded a very good Republican campaign story. It is, however, one that the Senator himself told a few years ago at a meeting presided over by Bishop Grant, of the A. M. E. Church.

His mother testifies for that period covering his home life that Charles was

Senator Fairbanks and Family at Their Illinois Farm Home Ten Years Ago

always a good, industrious, obedient and saving boy. Old college professors at the Ohio Wesleyan say that he was a close student and a good one. Entering

The Fairbanks "Autograph Album," Where Senator Fairbanks first made his mark. See "C. W. F.," Near Top

as a "prep," and under most unfavorable conditions, he attained that coveted of all college positions, the editorship of the college paper, and he was graduated with honors. Incidentally he met a girl, one who admired the fortitude with which he met the hardships of his college life, who did not take exceptions to his work on Saturdays for a colored contractor and with colored workmen, and one who defended him when any disparaging remarks were made about the "long, lean and lanky from the country," or "the six-footer out at the elbows." She was the daughter of Judge Cole, who lived at Marysville, and her name then was Cornelia Cole. It was several years before the young graduate was able to come back to Marysville and offer her a home, but he did it as soon as possible, and to Cornelia Cole-Fairbanks is due a great deal of the credit for Mr. Fairbanks's present position. She, too, has attracted much attention. She is the President-General of the Daughters of the American Revolution. It was at the great reception tendered Senator Fairbanks by the people of Indianapolis, when he returned to that city from the Chicago convention, that high tribute was paid her as "a woman beloved by all women." In answering this tribute, Senator Fairbanks was so much overcome that tears filled his eyes and an impressive silence was the high tribute paid to her and her loyalty.

But the old college days were strenuous. There are many stories of them. It seems that in wrestling with his room mate, Ira Andrews, one day, the "prep" split his only trousers, and so meager was the wardrobe that he had no money on hand with which to buy others. He and Andrews went to a clothing merchant and asked for credit for a $3.25 pair, Fairbanks promising to pay him the next week. Credit was refused. He then appealed to another clothing firm, Pumphrey & Jones, who extended the credit and received payment as promised. But whether they were hard days or not, they were happy and profitable ones, and as soon as they came to a close the young man became the agent and correspondent of the Associated Press in Pittsburg, and, making his living by that work, he spent his nights in law school. Later he did the same at Cleveland and then it was that an uncle, one of his mother's brothers, offered an opportunity at Indianapolis, and he went there as an attorney for a short line railroad. That was the beginning from which he climbed the ladder.

It was in 1897 that Daniel W. Voorhees, widely known as "the tall scycamore of the Wabash," vacated his seat of long tenure in the United States Senate and Charles W. Fairbanks, the first Republican from Indiana to appear in the upper branch of Congress in many years, was elected to it. His public career since then is too well known to need recital in this article.

The man, as the boy, has never been a player. Life has always been taken seriously by him, but he has one failing which has cropped out at Washington. It is "the stirring off habit." His quiet little "stir-off" parties have been a source of diversion that has become popular with staid old Senators at Washington who have been so fortunate as to be his guest at them. On these occasions the dignified garb is laid aside, and with

big iron spoon in hand the grown up Charles of the sugar camps of years ago leads the way to the kitchen, where fresh maple syrup is boiled down to the candy stage and stirred off. There long has been a mystery where the Senator educated his " sugar tooth " up to its present fine degree, and where he gained the art of making the best maple wax in the country. But the mystery is revealed when one visits the old Fairbanks homestead farm in the Big Darby country. Back on the farm still remain the ruins of the old Fairbanks sugar camp. It was his favorite resort in sugar season and out of sugar season, and there on a great beech tree, known now as the Fairbanks autograph album, he made his first lasting mark in the world. It is plain " C. W. F.," cut so deep with his jack knife years ago that the wound in the bark has not been covered. It is high above most of the other markings of the members of the family and where only a six-foot-lad could have placed it. The Fairbanks family, which through Mrs. Fairbanks, senior, still holds the farm, has built a fence around this tree to protect it and its precious markings.

The Amusement Business

BY EDWIN E. SLOSSON

"A trip up the Hudson, or down the bay,
A trolley to Coney or Far Rockaway,
On a Sunday afternoon."

IT is to be hoped that the effort being made to change the name of Coney Island to "Surf Island," or some other name without the peculiar and somewhat embarrassing associations of the old, will not succeed. It should stand as an evidence that a place as well as a person can reform. For Coney Island has reformed. Even a naturally incredulous public must be convinced of that. Coney Island is no Sunday school yet, but it is probable that nowhere else in the world can be found so great a variety of popular amusement with so little of the essentially vicious as on this little strip of sand which for two centuries has been a pleasure ground to the metropolis. In Texas and Colorado towns the lowest dive is apt to be called "the Coney Island," and from the date that Sunday, just 60 years ago, when it was reported that the enormous number of 300 vehicles had paid toll on old Shell Road, people all over the country have been shocked, both at its sinfulness and popularity. Men went to the seaside resort to be free, as they said, from the conventionalities of the city; the said conventionalities being, apparently, the Ten Commandments.

Shows that were not immoral were mostly fakes. Visitors expected to be sold and were rarely disappointed. Loud mouthed barkers coaxed, threatened and jeered the passing crowd into the booths, where, under one pretext or another, most of their money was extorted.

The reform of Coney Island was effected not so much by the pressure of public opinion of the respectable people who did not go there, or internal conviction of sin on the part of the dive keepers, or by the strong arm of the law, altho some courageous police action wiped out the most disreputable of the gambling hells, but primarily because it was discovered that vice does not pay as well as decency. It was learned that decent people have in the aggregate more money to spend than the dissipated, even tho they spend it more sparingly; that eleven dimes were more than a dollar; and that a show which can take in the whole family pays better than a show where only one would go. A reform based on financial advantage is likely to prove lasting. People sought the vicious amusements, not so much for the vice as for the amusement, and when they found they could get the latter without the former they flocked to Coney Island at the rate of 100,000 a day.

Important factors in the development of the new Coney Island are the syndicated amusements; first, Steeplechase Park, last year Luna Park, this year Dreamland. The proprietors of Dreamland claim that $3,500,000 was spent before its gates were opened, and the owners of Luna Park state that $750,000 was paid out this year on additional attractions. Just as in manufactures it has been found advantageous to combine all the interdependent industries, so in the amusement business it was found profitable to bring together into one inclosure all the popular forms of entertainment and exclude fraudulent and offensive features and objectionable characters.

The admission is only 10 or 15 cents and a view of the "park" itself, with its holiday thousands, its free shows, and its illuminated palaces of staff, is sufficient in itself to repay the trip. It is a development of the medieval street fair, a twentieth century Corso in carnival time. On every side are offered enticing entertainments, always just about to begin, and, if you do not find them all that your imagination led you to expect, it is because you have too active an imagination, and you console yourself that the show has only cost you from ten to twenty-five cents, and a quarter to a half an hour. In general, only soft drinks are sold in the park, and it is very rare that one sees a drunken or disorderly person. Policemen are chiefly for ornament, and the arrests reported after 200,000 pleasure

Luna Park by Night

seekers have spent the day at the island are very few; a marked contrast with the record of old Coney. Your pocketbook is not safe there yet, but it is not likely to be opened by another than yourself. It is the ordinary American crowd, the best natured, best dressed, best behaving and best smelling crowd in the world; not vulgar unless we mean by that, as many do, being obviously and audibly amused:

"Some think there's nothing half so good
As oysters, roasted, fried or stewed;
And others think the pleasure's more
A-sliding down the cellar door."

For each of the two great categories into which the poet thus divides humanity, their favorite amusement is provided. For the first there are restaurants; for the second there is a sort of magnified cellar door, long, wide and smooth, tho provided with enough bumps to make it exciting, down which the adventurous slide, landing in a mattress at the bottom; also a long and steeply sloping trough, with unexpected turns, out of which a constant stream of men, women and children pour before the delighted spectators. There are many other devices by which the people are made involuntarily to contribute to each other's amusement. There are seats that thump when one sits on them, sidewalks that jiggle, sudden winds that blow off hats, and mirrors of various curvature that continuously reflect moving caricatures.

In the popular amusements is most strikingly manifested that curious disposition of people to make their amusements so like their daily life. Like the power horse which was driven around the ring from left to right every day, and so on Sunday, to rest himself, went around all day from right to left, so human beings in their hours of recreation merely modify their daily treadmill. Farmers' boys, when they get together, play baseball or do athletic stunts; ministers for vacation go to a convention where they can hear preaching; cowboys do rough riding for their amusement; school-ma'ams on a holiday get up spelling

matches and literary people play crambo. So these city people, tired by the jar and noise and glare and crowds of the streets, go for recreation where all these are intensified, instead of to the quiet country. The switchbacks, scenic railways

Elephant Shooting the Chutes at Luna Park

and toy trains are merely trolley cars, a little more uneven in roadbed, jerky in motion and cramped in the seat than the ordinary means of transportation, but not much. The burning building is one of the most popular of attractions, because it is most like what they have all seen and know about and, therefore, are most interested in. The Ferris wheel and the gigantic see-saw are but exaggerations of the ordinary elevator, and the towers are not unlike office buildings.

The most beautiful features of these playgrounds of the million are made possible by the introduction of two new architectural factors, both practically discovered at the Columbian Exposition at Chicago in 1893, staff and electric lights. The utilization of staff and steel frees architecture from the restrictions imposed upon it during the past ten thousand years by the permanence, expense and weight of the material. The imagination of the designer riots in new and striking effects. The sight of this rioting is not always pleasant, but it is very encouraging to have the oldest of the arts show signs of new life. For my part I do not see why staff is not as beautiful as marble, and, if a structure is graceful and harmonious in itself, it makes no difference to me that it will not last a thousand years. I do not expect to be there to see it then, and I have no doubt posterity will be able to build new and statelier mansions and be very thankful to us that we did not consider ourselves conceited enough to build for them. Those to whom permanence is an essential feature of the beautiful should certainly have consistency enough not to admire a sunset, an opera or a maiden's smile.

At night, when the shams and incongruities are hidden and the architectural features are outlined by hundreds of

thousands of electric lights, the spectacle of the Dreamland tower, 375 feet high, as seen from the water, and of the court of Luna Park, is quite fairy-like and enchanting. Surely it is a great advance in methods of lighting since the time when men slipped down ropes over the dome of St. Peter's in Rome, lighting the flambeaux as they went, sometimes one of the men falling to the ground through the breaking of a rope, and when the admiring crowds gathered in the arcade at Milan to watch that miracle of ingenuity, a little steam engine running around the cornice of the dome and lighting the gas jets as it passed. Now, line by line, as we watch in the twilight, as if lit by an unseen taper, as if drawn by the architect on the darkness by a pen of fire, the building slowly appears, until with a final flash it stands like a glorified ghost of itself in the night.

Not only do our modern entertainers cater to the ordinary senses by music, colored lights and food, but in many of the most popular amusements they provide titillation for a more obscure sense, only recently recognized by psychologists, the sense of equilibrium, the sense which is affected when the motion of the body is changed in direction or speed, a sense located in part in the semicircular canals of the ears. This sense, like all the others, is a source of acute misery, the fear of falling and the feeling of seasickness, when stimulated too suddenly or too long, but, when gently excited, gives a sensation of pleasure. The magnified merry-go-rounds, the mountainous railways, the big steel arms which lift and swing and whirl people high in the air, the chutes, the loop, all act chiefly on this sense.

With these must be classed as causing the same sensations the illusions of motion. The haunted swing, where the room turns round and the spectator feels himself to be standing on his head, and the airship in which one goes to the moon both give the false interpretations of the

General View of "Dreamland" from the Top of the Chutes

Fighting the Flames (Dreamland)

visual impressions the same feeling of delightful dizziness.

To the pleasure of rapid and unusual motion is added in many of the amusements the delight of danger. This is, of course, mostly an illusion, for accidents to the participants are rare, but the apparent risk gives one a sense of personal daring very gratifying to us all, and as each boat load plunges down the chutes into the lagoon this finds expression in a cry for protection from feminine and an answering shout of triumph from masculine throats.

The pleasures of peril are enjoyed vicariously by looking at women escape from the burning building by a leap into the fire net, the trapeze performers and wire walkers, the bicycle rider looping the gap, and the man who dares to be a Daniel and go into the lions' den. But our feeling for the dangers and sufferings of others is easily jaded, so the feats must each year be more and more dangerous to excite the interest of the spectators. How far the cultivation of this appetite will go no one can foretell. At present a slight shudder passes over the crowd and their pleasure in the spectacle is distinctly impaired when a Japanese tumbler falls to the ground and crushes his head, and the scene at the fire becomes too realistic by the killing of a man with the fire engine, but no doubt this squeamishness will be soon overcome, and, in fact, must be if this kind of amusement is to go on. The popularity of modern football shows how easily the crowd can be trained to cruelty and to watch with indifference and even delight the bearing from the field of young men maimed in the struggle. The Romans were wiser than we in using criminals and prisoners for this purpose instead of their brightest and best educated men. It cannot be long at the present rate before fights of wild beasts are added to these popular amusements; indeed, they are not infrequent now, altho not prearranged, and perhaps in time our girls will turn down their

thumbs with the same joy as the Vestal Virgins to have a defeated gladiator put out of his misery.

Panoramic effects are most popular when they represent some great disaster. The "Slocum" is not yet presented, but Texas and Pennsylvania are far enough away so the Galveston and Johnstown floods can be given, and Pompeii and St. Pierre are destroyed, and the "Maine" and the "Merrimac" blown up, and other battles refought, every hour to the great delight of the multitude. Considered as spectacles some of these are very ingeniously given, and since they are accompanied by a lecture, they have some educational value.

Among the instructive features are also to be classed the reproduction of the Durbar, the Indian and other villages, the Dumont air-ship, the submarine boat and many others.

It is encouraging that the old taste for freaks, for human and animal deformities, seems to have been outgrown. Living skeletons, bearded ladies, five-legged calves and the like have almost disappeared. Dwarfs are still in demand, but not the ugly and misshapen kind.

After all, the social feature is the important one in popular amusements. Does any one go to Coney Island alone? To get away for a holiday, to "go some place,"* is the common desire. Hospitality and visiting in the country sense being impossible in city flats people must meet in public, and little trips by sea or land afford this opportunity. The reference to "dear little Coney Isle" in the folk love songs show what a part it has played as a matchmaker. Many a young couple have been so well satisfied with each other in this short journey that they have decided to continue traveling together through life, and a sudden clutch of his arm when the boat goes through the mill-race has often brought a young man to realize how pleasant it would be to have the right to protect and cheer the maiden by his side. The young man who takes his girl to Coney has also a chance to find out whether she is economical or extravagant in her tastes. A little more thoughtfulness of her escort's pocketbook would, therefore, often pay the girl in the long run. Since time is money, some girls think that the more money is spent the better time they have had. As I stepped off the steamer at the conclusion of the arduous investigations involved in the preparation of this article, I overheard the scrap of a conversation between two girls, temporarily parted from their escorts. Said the girl in the red hat to the girl in the white one:

"What sort of a time did you have?"

"Great. He blew in $5.00 on the blow out."

"You beat me again. My chump only spent $2.55."

* The authority for the use of this popular phrase will be found in any standard grammar published in the twenty-first century.

The Confidante

BY NORA ELIZABETH BARNHART

I let him in and shut the door,
  And when the key was turned
There leapt a look into his face—
  A look I had not learned!

Within the four walls of my heart
  He sudden stalked a lord,
Possessed of all he did survey,
  To hold by might of sword!

Ah! Then, how gray and small the room
  That I had dreamed so fair!
How paltry were its furnishings,
  Its wealth of book and chair!

The wide-flung window seemed to shrink,
  That long my stars had framed!
The stretch of daisy fields and hills
  Lay startled and ashamed!

And all my little world was his,
  Which once had stretched so wide!
He holds the key upon his palm,
  And jingles it with pride!

GRAND RAPIDS, MICH.

What May Happen in Russia

BY S. KNIAJNINE

[The author of this article was formerly editor in chief of the *Svoboda* (*Liberty*), the organ, which appeared for some time in Paris, of the Russian advanced party.—EDITOR.]

THE greatest enemy of the Russian Government is not the Japanese army facing General Kuropatkin, but rather the army of discontented people at home within the borders of the Empire itself, whom Governmental oppression, through long years of evil-doing of all sorts, in all parts of the vast monarchy, has raised up as an implacable enemy.

S. KNIAJNINE

In this large and powerful body of malcontents we should place first the subjected races, peoples in a perpetual state of harassment on the part of the St. Petersburg authorities.

In this category the Poles deserve to take front rank, filled with anger and hatred, as they are, against the Governmental policy of excessive Russification, which prohibits the teaching of the maternal tongue in the schools of Russian Poland, a portion of the Empire which is just now in a state of extraordinary excitement. Indeed, since the outbreak of the war, the two powerful anti-Governmental parties, the Popular League and the Socialist Party, have found it necessary, in order to prevent a bloody act of coercion, to use all their influence to dissuade their partisans from having recourse to an open insurrection. The consequence is that the Russian Government dare not withdraw any troops from the Polish Provinces, where, furthermore, collisions between citizens and soldiery occur almost daily.

Finland, too, is another Poland. The valiant, liberty-loving Finns detest the present *régime* of perjury, illegality and violence set up against them by M. de Plehwe, the Russian Minister of the Interior, and by General Bobrikoff,* the Military Governor of Finland. The lamentable condition of affairs in that part of the Empire was fully laid before the readers of THE INDEPENDENT by Mr. Erik Ehrström on December 3d last. The Russian Government has nothing to hope for and everything to fear from that quarter. This is only too evident.

The whole Caucasus is also in a slumbering state of revolt, especially since the Georgians have begun to organize revolutionary societies and the Armenians, who, since the Government has laid heavy hands on their lands and the National Church, are second to none in their hatred of all that pertains to Czardom. So here, too, a goodly number of troops must be kept unoccupied.

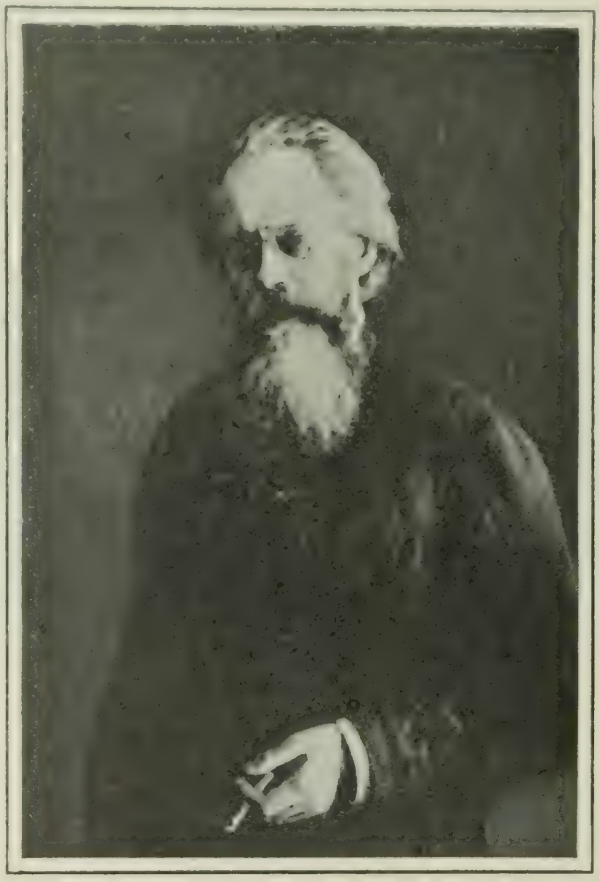
I say nothing of vast Siberia, where scattered over the whole country are colonies of convicts and political exiles who detest their keepers, both of low and high degree, and where, a few weeks

* This article was written a day or two before Bobrikoff's assassination.—EDITOR.

ago, nearly 40,000 inhabitants of one single region desired to emigrate to China in order to escape the vexations of the Minister of the Interior.

In the interior of Russia proper we find three revolutionary parties boldly facing the Government of the Czar,—the Social Democrats, the Revolutionary Socialists and the Union of Hebrew Socialists. All three are keeping up a continual propaganda addressed to every stratum of society, but especially to the working classes of the cities and even to those of the country districts. Thousands of tracts and proclamations are scrattered broadcast throughout the land, explaining every event and the whole political policy of the Government, in a spirit, of course, of stout opposition. They have organized in all the cities societies for the spreading of the good word and for agitation, and, in spite of wholesale arrests, the movement goes on unchecked. No good is accomplished by these wholesale arrests, but quite the contrary. The authorities cannot kill the prisoners, who have to be held or set free. The result is the increment of the body of malcontents, for all these political prisoners have relatives and friends. This reckless policy of arresting right and left has called forth this remark in St. Petersburg: "Here in Russia, while one-half of the population is fighting at the front, the other half is kept in prison." It is quite true that the prisons and jails are overflowing, and to such an extent that houses never intended for this purpose have had to be rented in which to lock up Russian citizens; and this at a moment when Russian armies need reinforcements at the front. Such a state of things is a moral defeat for the Government, quite as fatal as those occasioned by the Japanese on the battlefield.

MADAME VERA FIGNER,



One of the leaders of the Revolutionary party from 1879 to 1884. She was condemned to death for the part she took in the assassination of Alexander II, but was imprisoned in the fortress of Schlüsselburg, where she still is.

But what weakens still more the present Government in its home policy is the presence of a new force, which is beginning to take on an organized form and to loom large on the Russian political horizon. I refer to the Liberal Party, representing and including all the various strata of the nobility, municipal bodies, district governments, the burgher classes of the cities and the liberal professions, which, after a long, a too long, period of passive opposition, more platonic than practical, are now coming forward to help organize a great political party and to demand political reforms, or, rather, political reform—that is, liberty. For the first time since a century, this party has an organ in the press, the *Osvobojdenie (The Enfranchisement)*, well supplied with money and good writers. It is carrying on a legal propaganda, criticising the wrongful acts of the Government and bravely opposing every vexacious and illegal measure of the authorities.

This Liberal movement, which is making rapid progress and becoming really strong, is beginning to frighten even M. de Plehwe himself, who can no longer restrain himself and who made this statement to an unfortunate writer who went to him to ask why he was to be deported, since he was not an extremist. "Yes," explained, cynically, the Minister of the Interior, "I know that you are not a Revolutionist. But it is no longer the Revolutionists whom we fear, for we have a million (?) bayonets to turn against them. It is you Liberals who are a danger, and especially those of you

who do not go outside the pale of the law in your opposition to the present *régime.*" A Government which, by the mouth of one of its chief ministers, makes such a confession as this—that it fears especially those who do not violate the law of the land—such a Government making such a confession signs thereby its own death warrant.

Under these circumstances, it is easy to understand how the state of discontent is becoming general and how a revolt against such a *régime* is spreading through all classes of Russian society, even those where the most pacific ideas reign. This also explains why an autocracy which, during long centuries, dared to do anything, no longer dares to do many things. Hence it is that the Government has not put its veto on the interference of the municipalities and the assemblies of the nobility in the matter of the care of the soldiers and sailors at the seat of war. They seem to say to the Government: "You are incapable of organizing the military sanitary services, so let us do it, as this concerns our sons and brothers."

NICOLAS MIKHAILOVSKY,

Critic and sociologist; one of the leaders of the progressive party in Russia from 1869 till the present year, when he died.

The full significance of this state of mind will be seen when the war comes to an end. Then it will be found, I am sure, that I have not exaggerated the importance of this Liberal movement. The great party, which is in the background now, will then come to the fore with the will and the power to accomplish much, I am convinced.

We have thus seen that the effort which the Russian Government is forced to make in order to meet the Japanese—it will be noted that I do not say to beat the Japanese—is too much for its moral strength. But this nefarious war, whose aim and cause the people do not yet comprehend, is a further source of weakness to the present *régime,* the effects of which will especially show themselves toward the end of the struggle. I refer to the enormous material harm it is doing the people. Thousands of families are already ruined and in mourning, and the end is not yet. When these afflicted families finally rise above their losses, they will lend a willing ear to the words of the malcontents, the Revolutionists and the Liberals; they will then fully grasp the grave faults and criminal culpability of the present Government, which rushed headlong into this murderous struggle with Japan. An exhausted treasury, business stagnated, all the evil results of a terrible war, will add their difficulties to the moral and political shortcomings of the *régime,* which will surely be shaken to its base thereby.

Whether the Japanese are vanquished or victorious, the present Government will be considered incompetent. Its incapacity and its negligence in administering the affairs of the country are too evident to be explained away. The war once brought to a close, even more or less to the advantage of Russia, the present *régime* must, if it is to continue in any form, turn toward the nation and grant certain concessions in the form of political liberties. There must be a free press; we must enjoy the right of public meeting and discussion; the demands of the municipalities and the provincial assemblies must be received and listened to;

the working classes and the professions must be granted the right to form societies and unions, greater liberties must be accorded to the universities,—such are some of the chief reforms that will surely result from the present conflict.

If Russia receives a decided defeat at the hands of the Japanese, then the situation of the Government and the whole *régime* will become more serious; for, in this case, it is the revolutionary parties that will come decidedly to the fore and that will take the lead in the reform movement. For the past thirty years they have been carrying on the fight against great odds and have felt themselves stronger after each reverse. To-day they have many of the lower classes in their ranks, an element that has less to lose and so much to gain. This united body is only awaiting an opportunity to make a final assault on the Governmental citadel. When the rush comes, it is probable that they will sweep all before them, as the Japanese are doing in Korea and China. Then it will not be simply a matter of reforms, but a life and death struggle between autocracy and liberty. The present coterie which rule Russia never dreamed, when they began this war, that they had started Czardom on a course at the end of which was a fatal fall, or, at least, a change of *régime* in the direction of modern forms of government. We are now moving toward that fall or that change, perhaps toward both, with a giant's step.

PARIS, FRANCE.

Why I Am Still Unmarried

BY A PHILOSOPHICAL BACHELOR

[The author of the following article is a professional man who has received high honors from several universities, and some of whose mathematical work has attracted attention in Europe as well as in this country. His views on matrimony are so similar to those of the "Bachelor Maid" which we published three weeks ago, to which this reply is volunteered, that we regret that editorial etiquet prevents us from introducing them to each other.—EDITOR.]

WITHIN a few months I have been called, for the first time, an old bachelor. I object to the adjective as being altogether anticipatory. But if I live long enough I shall probably live up to it, and meantime I am philosophical. I occasionally ask myself, as others ask me, why it is that I am still unmarried, and with matrimonial prospects as "unfavorable" as they were reported to be in the year-book of my college class, which was published about twenty years ago. There may be a number of reasons, but among them is not the one that I have not had a number of good offers, nor the one that any offer of mine has been declined.

I have always thought that the same rules of conduct should apply to both men and women, and children, too—so far as they have maturity. I will not criticise a woman for saying or doing anything that is proper for a man—the customs and conventions of society to the contrary notwithstanding. I have sometimes remarked that I think it is just as proper for a woman to propose matrimony as it is for a man, even when it is not leap-year, and the suggestion of this opinion has several times led to the undesired receipt of such a proposal. By these experiences I have learned to state this article of my social creed only in anonymous writing.

I also hold that no woman, or man either, should choose a matrimonial partner before having at least a good prospect of giving adequate financial support to a family. It is an ethical principle that the acceptance of a privilege involves the performance of a duty.

"A Bachelor Maid," through the columns of THE INDEPENDENT, expresses herself forcibly in regard to the injustice of expecting a woman to sacrifice her judgment, her tastes, her ambitions and her chosen vocation—for which she has fitted herself perhaps in response to God's

own voice in her mind—in order to accept the exclusive and very exacting position of a housekeeper, wife and mother on the call of a man who chooses her for his partner because of physiological and sociological reasons. She complains rather bitterly that men regard women simply as home-makers, whose lives are to be absorbed in their own, and devoted especially to the raising of their children. Judging from my own observations, this narrow ideal of woman's duties is entertained by women even more than it is by men.

I was graduated first from an old-fashioned college, and then took a post-graduate course at the famous co-educational university whose president recently recommended the new bachelors of art and science to cease being bachelors in any other sense. The change of atmosphere from the small denominational college to the great State university was exhilarating, but nothing impressed me more than the high character of the women students. I became an enthusiastic champion of co-education as I began to realize how much delightful and natural stimulus and companionship I had missed during my college course. But even in my improved environment I met with speedy disappointment. I thought such intellectual young women would have superior views in regard to social questions, and particularly regarding the independence of women and the ideal of matrimony. But, alas, it was not long before one of the brightest of them told me about an indignation meeting the "co-eds" had just held because they did not receive enough social attentions from the men students. And another one to whom I suggested my idea about their superior view of matrimony hastened to say: "I want to set you right on that subject. All the university girls I ever heard speak about it think just as girls generally do." I suppose it is undeniable that girls generally think a woman's place is in the home which she is predestined to make for some man.

Home making and family nurture is a humble service which is glorified by love and heaven's own light. But under modern conditions of co-operative housekeeping and education it is a constantly decreasing fraction of the world's work. Such work well done will always be a worthy and blessed service, but it ought to interfere as little as possible with the independence of women. I fail to see that women are born to keep house any more than men are born to till the ground, and as fast as labor-saving machinery and methods are introduced these two time-honored and indispensable classes in the community, the housekeepers and the farmers, decrease in numbers—to the advantage of those relieved and also to the advantage of society at large. The duties of maternity certainly ought not to be evaded, but they may be greatly simplified by the general use of kindergartens, day-nurseries and all the other approved facilities for the care of children which ought to be found in every community.

Regarding the number of children, I think the attitude of every husband should be expressed by "Small favors thankfully received." The only woman I was ever engaged to asked me how many children I would like to have. I replied, "Half a dozen, more or less." We were not engaged very long.

A man who has a talented and ambitious wife with an opportunity to make a career for herself in any public way, or in any congenial business, should make it his constant pleasure to give her his sympathy and advice therein whenever asked. He should treat her in that connection exactly as a wife ought to treat her husband—and so exemplify the Golden Rule, which is golden simply because it works the same both ways. When a talented woman feels that her duties are limited to her home her relations may accept her judgment thereupon, and so far agree with her, but not without some feeling of disappointment at her lack of a broader ambition. The idea that a successful business or professional woman, as soon as she is married, ought to retire permanently to the inclosure of her new home appears selfish and contrary to public welfare. On the other hand, marriage ought in some cases to give a woman opportunity for service to the community which her circumstances had previously denied her. The ideal marriage is one in which not only the happiness but also the usefulness of the contracting parties is increased, so that the community at large

participates in the blessing which comes presumably to those who establish a new home.

One thing seems sure. The man who marries a woman with even one talent, and then selfishly uses his influence to have her hide that talent, will have much to answer for.

Any man of my views would highly appreciate as a wife a woman of affairs who might say to him any evening: "My dear, I am sorry to say that my business calls me to Chicago, and I must leave on the midnight train. Before I return I shall probably go to Colorado to visit the ——— mine. The directors are discussing the need of a new plant and I want to examine the actual conditions. On my way back I may stop at ——— College and deliver that address I promised last year."

The successful teacher who urged her *fiancé* to a speedy marriage with the argument that unemployed teachers would rise up and call him blessed for making a vacancy in the pedagogical staff was not sound in her economies.

An old young lady remarked to me in a very plaintive way, "I suppose I shall always have to take care of myself." Why, indeed, should she not take care of herself? She has a sound mind in a sound body, and is equipped with a university education. At the moment she made that remark I believe I should have respected her more if she had been an illiterate girl boasting of her smartness in earning ten dollars a week and holding her job while her companions in the shop or factory were laid off.

A young lady asked me, "What can a girl do to make a man propose to her?" I replied, "I don't know, I am sure. I have had all kinds of experiments tried on me—but none was successful." I think, however, that I would be most disposed that way by an argument showing that some one's usefulness outside her home, as well as her happiness within her home, would be increased by marrying me. I have never had presented to me any strong arguments along that line, and the suggestion is made as appropriate to leap-year.

To hear a woman speak in public I will go twice as far as to hear a man of equal ability. I also thoroughly approve of women in business. I like to see thousands of these wage-earners filling the street-cars morning and evening. They represent to me a very commendable utilization of energy—in rather marked contrast with the economic non-productiveness of society women. And at lunch time I generally go to some restaurant patronized by business women because they rest my eyes. Tho I must confess I find it trying to do business with a woman.

The chief feeling which deters me from marriage is the dread of waking up some day and finding that the woman I have married is not really the person I supposed her to be, but somebody else with quite a different and uncongenial character.

Probably my mother is the only woman I have ever thoroughly understood, and sometimes I am doubtful about her. If a man could only know what is going on in the minds of women it would be of inestimable assistance in getting acquainted. As it is, I feel with most women somewhat as I do with the Japanese or other foreigners who command my sincere respect and admiration for their excellent qualities, but who cannot have my fullest confidence because I do not understand their way of looking at things, and who, therefore, always keep me on the *qui vive* for a surprise.

If I had to choose matrimonially between a bright and beautiful girl with an antagonistic disposition and a hardwood Indian maiden—such as were once used for tobacconists' signs—I would take the Indian maiden every time, because she would be better to live with and I would be reasonably sure that she would not destroy my peace of mind nor hinder the execution of my plans.

Perhaps "the object" of marriage is best achieved when not directly sought. We might question whether the strong, heedless, unreasoning voice of fruitful nature, which Lester Ward aptly calls the "biological imperative," and which is closely allied to what romanticists call falling in love, is not the true guide to the best choice. As a general principle, it has always appeared to me that in the choice of intimate friends and companions one should follow the dictates of his heart as long as they are not checked

by the reason of the conscience, and that especially in matrimonial alliances this course may be expected to result in the greatest happiness of the contracting parties and also the greatest good of the community, both present and future.

Marriage, it seems to me, is a sacrament which symbolizes the oneness of minds and hearts of the contracting parties. How can there be a true marriage between those who do not think alike? I have absolutely no sympathy with those educators who hold that the sexes should be educated separately in order to enhance what they call the natural difference of the sexes in tastes, habits and methods of thought. Society from the earliest times, by the subjection of women and otherwise, has gradually produced differences between the sexes, and constructed a barrier between them which is artificial in reality, altho commonly called natural because now almost universal. Anything which tends to obliterate these artificial distinctions ought to be welcomed as promoting the approach by humanity to the highest ideal of character—which is neither male nor female. There doubtless are some natural mental as well as physical differences between the sexes, as Havelock Ellis has shown in his "Man and Woman," and between boys and girls, as Dr. Stanley Hall has shown in his recent work on the "Psychology of Adolescence," but these differences must be minimized instead of being enhanced when both sexes approach one ideal.

Biology supports this view that non-essential or secondary sexual differences are being eliminated by evolution. In the lower orders of animal life there is very great difference in the size and structure of the two sexes—much greater than can be found in any of the higher orders.

Ethics also gives support to the same view. Those who advocate the differentiation of the sexes naturally believe in a double standard of morality—which is repugnant to a high conception of the eternal and unchangeable principles of justice and truth.

Society is still suffering, unconsciously, from a great curse inherited from the days of chivalry, when the differentiation of the sexes reached its ultimate.

I do not admire mannish women nor effeminate men, but I see no reason why each sex may not acquire from the other the good qualities in which it is itself deficient, and so approach a common ideal of perfect humanity.

The reason why I am still unmarried, stated in a single sentence, is this: I have such a high ideal of the supreme mutual love, admiration and confidence, as well as adaptability and actual agreement, which ought to subsist between the contracting parties to a true marriage, and such an inclination to wait for a demonstration of the existence of those necessary conditions for a happy union, that I have never yet passed beyond the preliminary stages of infatuation to the supreme hight which I feel sure is possible and may at any time become actual in the presence of the right woman.

The trouble with me is, I have been philosophising instead of falling in love, and have widely distributed, instead of concentrating, the warm admiration I have for the ability, amiability, efficiency and beauty of American women.

More About Autographs

BY ADRIAN H. JOLINE, LL.D.

[The genial author of "The Meditations of an Autograph Collector" requests the opportunity of vindicating his methods of obtaining autographs against the aspersions of the anonymous "Maniac" whose confessions we published May 26.—EDITOR.]

IN a recent number of THE INDEPENDENT a gentleman who describes himself as an "autographomaniac," and who manifestly possesses what Mr. Gilbert calls a pretty taste for paradox, has taken up the cudgels on behalf of the unpopular persons who "write for autographs," and while he confesses that his pursuit is "shocking," he is brave enough to declare that he is "willing to take the consequences." I fully agree with him in his characterization of his nefarious habit, and am content to submit his case, as he makes it, to the tribunal of public opinion, without argument on behalf of the respondent. He is welcome to the consequences, whatever they may be. He has incited me, however, to say a few more words about autographs, because he does me the honor to say "Such distinguished collectors as Dr. G. Birkbeck Hill and Mr. Adrian Joline turn up their noses at my kind," and he makes some jocose, but unworthy, reflections upon my method of cultivating my hobby. He betrays himself as not a real collector, as only an amateur, who has not approached the shrine with proper reverence and preparation. Dr. Birkbeck Hill was in his lifetime a scholar and a clever literary man, who wrote a pleasant book called "Talks About Autographs," but he was not a collector in the ordinary acceptation of the term; and I am by no means a "distinguished" collector, altho I thank the "Maniac" for conferring upon me a title so honorable yet wholly undeserved. What amuses me most about the ravings of the "Maniac" is the assertion that collectors of my own way of thinking buy at auctions and through dealers "dry-as-dust letters written for the most part by men long since gone to their fathers," while the "pestilential nuisances," to borrow another Gilbertian phrase, confine their attention to autographs of the living and especially prize the peppery responses they receive from persecuted greatness. It reminds me of the fable about the Oxford guide who exhibited to his party Jowett, the noted head of Balliol College, wrathful and indignant at the assault upon his study window, and of the individual whose favorite boast was that he had been soundly kicked by a Royal Duke. "Such and so various are the tastes of men."

Thomas Bailey Aldrich, in his "Ponkapog Papers," speaks of "the average autograph hunter with his purposeless insistence"—"the innumerable unknown who 'collect' autographs as they would collect postage stamps, with no interest in the matter beyond the desire to accumulate as many as possible." He tells of a case where a fellow author was asked by a bereaved widow and mother to copy for her some lines from his poem on the death of a child, to comfort her for the loss of her little girl. Two months later he found his manuscript with a neat price attached to it in a second-hand book shop. I am well pleased to be excluded from that class of autograph seekers, and I do not envy the "Maniac" who cares to array himself in such an unworthy company.

We occasionally buy the letters of the living, and only a few weeks ago the newspapers were quite stirred up by the sale of a letter from the Prince of Wales, now Edward VII, to Mrs. Langtry, for the respectable price of $90. Even the journals which make pretensions to decency and good taste broke forth in clamor, one of them sneering at the alleged value of collecting as a preservative of literary and historical treasures, and another announcing with oracular finality that the incident proved the "snobbishness" of collectors. All these deductions are based upon insufficient premises, the offspring of imperfect intelligence, and the evidence of that tendency to hasty judgment which marks the utterances of the unreflecting and uninformed person. The chances are that the bidder was unconsciously competing, through an agent, with some rival, who had given an order without a limit; or that the owner was making

what is known in Wall Street as a "washed sale," in order to establish a market price for a number of similar specimens. I have heard a rumor that a faithless maid of the famous actress stole a lot of letters from her mistress and that the vendee is endeavoring to "realize" on the ill-gotten booty. But whether these conjectures are well-founded or not, it is certainly quite easy to understand why a letter from a royal personage to a noted beauty, a distinguished ornament of the stage, should possess an interest for a collector wholly apart from any element of snobbishness.

Before me lies a faded pamphlet, a copy of "The Atheneum, or Spirit of the English Magazines," published in Boston on January 1st, 1828, containing articles unblushingly appropriated from British periodicals in the days when our own periodicals were feeble, few and far between. Among them is one on "Autographs," beginning with these words:

> "In direct opposition to the established maxim, 'A living dog is better than a dead lion,' the autograph of a dead man is better than that of a living one; indeed, the longer a man has been dead, the better the autograph."

The genial "Maniac" may whimsically dispute this proposition, but it is an eternal verity, far beyond the power of any of us to controvert successfully. As with the pictures of famous artists, the price increases when the source of supply is cut off, and the price measures the value.

I am glad to have my friend draw down upon himself the lightnings of great men's wrath, because some day the thunderers will be dead, and his specimens, heroically gathered in defiance of their indignant bolts, will be lovingly cherished by disciples of the cult whose coat-tails are immune to the kicks of enraged authors and statesmen. It is true, nevertheless, that mere "autographs by request" are of little value in the eyes of a wise collector; even when they have the spice of bitter resentment they are by no means precious.

Almost every one who reads and thinks has a pleasure in looking at autographs. In the great library of the Vatican I have observed the eagerness with which the visitors contemplate the handwriting of Henry VIII, of Anne Boleyn and of Martin Luther, the latter being oddly preserved in a place where one would scarcely expect to find it. The throngs who gaze upon the wonderful collection in the British Museum testify to the fascination which clings to actual pen-tracings made by men and women of historic fame, and the multitudes who visit the Congressional Library in Washington linger over the glass-covered cabinets where the letters of our Presidents as well as of many other noted public men, grouped with their portraits, are admirably arranged for inspection by the curious.

The interest of many examples in collections is purely autographic—that is to say, the simple fact that the lines were inscribed by the particular person is the chief stimulant of the beholder's imagination. It may be merely a formal document to which only the signature of Queen Elizabeth, or of Napoleon, or of Charles I of England, or of Washington is affixed; it may be nothing but a line or two penned by Samuel Johnson, or by Dean Swift, by William Pitt, or by Cardinal Richelieu,—the effect is the same, and no one who has a spark of fancy can fail to gain some pleasure from the contemplation, for example, of an official paper bearing the names of Charles II and Samuel Pepys, or a parchment scroll subscribed by Oliver Cromwell. It is a simple matter to advance from this point to the delight of reading original letters and manuscripts of intrinsic interest, and with the charm of reading comes the joy of possession. It is a joy whose nature is absolutely different from that which a bibliophile experiences when he gloats over his precious "first edition," or hugs to his bosom his invaluable Caxton. Sometimes there may be a sense of pride in the ownership of a thing which no one else can own, and we may detect the note of triumph sounded in the boast occasionally uttered by even the most modest of my class,—"No specimen, sir, in the British Museum!" But the real delight is in the feeling of companionship with the man who wrote the letter or the book. I have lived with Lamb, talked with Macaulay, listened to Dr. Johnson, admired with Boswell, breakfasted with Rogers, gazed upon Thackeray at the Garrick, and stood in the

presence of Pope and Dryden. If such be the results of my devotion to "musty-dusty stuff," my amiable lunatic of Madison, Wisconsin, then, in the immortal words of Patrick Henry, "make the most of it."

The number of genuine collectors in the United States is not large, but it is increasing. To those of us whose appetite has not yet been satiated, it is discouraging to observe the rise in the prices of desirable autographs. The *Atheneum* article, from which I have already quoted, refers to contemporaneous auction values and speaks of Cromwell at five guineas, Francis I at four shillings, Sir Francis Walsingham with five added signatures at nine shillings. Lord Nelson at two pounds fifteen shillings and Gibbon at eight shillings. Before me is a manuscript catalog of a leading London house, in which Cromwell figures at eighteen pounds twelve shillings, Francis I at ten pounds, Walsingham at thirty-five pounds and Gibbon at two pounds fifteen shillings. At a sale in London in May, 1904, a letter of Nelson to Lady Hamilton brought one thousand and thirty pounds—it seems an absurd price. The *Evening Post* bibliophile intimates that it is likely that "two agents at the sale had unlimited bids from long-pursed buyers, and each determined to outbid the other, and both lost their heads." I am pleased to find one of my theories about these tremendous prices sustained by such a competent authority. There are other reasons for the differences in sale values. The importance of the contents of letter or document, the sudden increase in the fame of the writer, and the anxiety of some enthusiast to obtain the one specimen needed to complete a "set," are all factors. Ten years ago the eighteen lines which now confront me in the rather boyish scrawl of Theodore Roosevelt might have been found in "the seventy-five-cent list," but it cost me $10—a fact which illustrates the adage concerning the unwise person and his supply of coin, more forcible than polite. It suggests the idea that the problem of what to do with our ex-Presidents is more easily solved than we had supposed. Ten autograph letters a day at ten dollars each would afford a respectable income, altho there is danger of overstocking the market; but Congress might establish a fixed price, deriving its power in that regard from the interstate commerce clause of the Constitution.

Bearing in mind the record contained in the *Atheneum*, it is likely that the man who bought wisely in 1828 might have left a legacy to his descendants far more valuable than city lots in upper New York, which have enriched so many members of our modern automobilistic aristocracy. Regarded as an investment, I am inclined to believe that a well-selected collection of autograph letters may be in the long run superior to United States Steel stocks or Shipbuilding bonds. It is true that autographs pay no dividends, but we know that, and we never know whether we are to get our income from what we are pleased to call our "securities." There is great satisfaction in being certain about something. I know that I have been offered for a dozen letters of Washington double the amount I paid for them a few years ago, and I cannot say as much for any of the beautifully engraved certificates or evidences of indebtedness of "railways" or "industrials." I suppose the name "industrials" was adopted because of the energy with which the promoters "worked" the community. The real collector, however, has small regard for the sordid side of his occupation. I would not part with my Washingtons for many times their cost; but I like to think that somebody covets them.

When the "Maniac" charges me with turning up my nose at his kind, he is mistaken. I am not what Miss Squires called "a turned-up-nose peacock,"—far from it. Dickens remarked that a peacock with a turned-up nose is a novelty in ornithology, and a thing not commonly seen. A collector of autographs who turns up his nose at any other collector would be just as much of a novelty. The collector who deserves the name is comprehensive in his affections; nothing collectorial is alien to him. He would, indeed, be an offensive creature who would scorn the feeblest efforts of an aspirant, the incipient struggles of a neophyte whose untutored mind is striving toward the ultimate goal of ambition. I remember that in my salad days I deliberately destroyed a large number of interesting letters of public men in order

to save only the signatures, and yet I escaped an indictment for malicious mischief. We must all have our beginnings; we must pass through the trying ordeals of infancy, of boyhood, and of young manhood. A veteran collector would no more dream of distorting his nasal organ in the presence of youthful ignorance than Grant or Lee would have thought of sneering at a cadet, or Choate or Carter would think of despising a recent graduate of Chase's Law School or a Bachelor of Laws just out of Harvard or Columbia. It is delightful to observe the protoplasmic germ of a collector. No one can tell what may come of it. It may develop into greatness.

NEW YORK CITY.

The Proposed Pan-American Railway

BY CHARLES M. PEPPER

[Mr. Pepper, who is the Special Commissioner of the United States for the Pan-American Railway, has just returned from a comprehensive trip through South and Central America to make a report to our Government on the railroad situation there. We are glad to give our readers the results of his investigation in the following article. —EDITOR.]

THE promotion of peace and trade on the Western Hemisphere is the purpose of the Pan-American Railway. The various governments are co-operating with that idea. Commerce promotes peace, and whatever aids in the development of trade relations is an international good, both from the sentimental and the selfish standpoint of the different countries.

The project has been called a dream, a mere sentiment, and without freight and passenger traffic in prospect it might always remain such. But there is a practical as well as a sentimental side. Whatever tends to end the geographical isolation of the different nations of South America and Central America improves their political relations. Whatever draws them closer to the United States increases the influence of this country and helps to give effect to the Monroe Doctrine.

For a dozen years or more the idea of an intercontinental railway has been taken out of the domain of dreams, tho some of the statesmen who have advocated it have confessed that they saw the realization only in their visions. But the practical measures began when the first Pan-American Conference, held in Washington in 1890, under the guiding influence of Mr. Blaine, made provision for an intercontinental survey. That survey was carried on under the direction of experienced civil engineers from the southern border of Mexico to the northern border of Bolivia. Its results have been of unquestioned value.

The second Pan-American Conference, held in the City of Mexico in the winter of 1901-02, took further practical steps. Inasmuch as a dozen nations are interested, the co-operation of all of them was desirable, and this was secured by the Mexican conference. The general subject was discussed in all its bearings and means taken to bring about a uniformity of policy. Furthermore, a permanent committee was created which preserves the continuity of the project and assures the means of informing the public of what is going on. This is, in brief, the outcome of two international conferences, and when the third one is held a few years from now undoubted progress will be reported.

If there were one government from Mexico to the Isthmus of Panama, and another from the Isthmus to the Straits of Magellan, the linking of the continents together by a steel highway might be simple, for railways might be built as they have been constructed by Russia. But since this condition does not exist the next best thing is to secure uniform action within the borders of the different countries so that their railway policy will be adapted to reaching the territory of their neighbors in the manner to form ultimately a through trunk line. In plain word, the notion is to zigzag

The Proposed Pan-American Railroad

from New York or from Hudson Bay to Buenos Ayres by means of through connections. The United States, with its numerous lines extending into Mexico, already has the basis for further communication southward. What it is doing now in the official sense is to furnish the information for capitalists of the opportunities which lie to the south, both for railway building and for general trade and internal development.

It is a long stretch to cover 4,700 miles or thereabouts, which is the total of the gaps now existing between New York and Buenos Ayres. Some of the sections admittedly are unproductive, tho none of them so much so as the Nevada sagebrush desert, or even the northern sections of Mexico. But the governments of the different countries in South America have the same interests in spanning the unproductive sections that the United States had in getting across to the Pacific and that Mexico had in reaching to the Rio Grande.

The practical question is the ability of the various countries to give sufficient aid by subsidies and other means for constructing unproductive railway lines in order that great productive regions may be opened up. They are doing this now with considerable success, notably in the Argentine Republic.

To the query so often made as to when the Pan-American Railway will be built the answer is to look at the map and see how it is now building. There is real significance in Mexico extending its lines to the border of Guatemala and the Argentine Republic, actually crossing the frontier of Bolivia under an international treaty, and prolonging its system into the latter country. There is also significance in completed sections of railway along the intercontinental route in Peru and in Guatemala. It is only within a few months that these lines, which some years ago were declared to be mere dreams, have been finished.

I do not venture to say when a through trip may be taken from the Hudson Bay to Buenos Ayres or Santiago by rail, but the prophecy can be made that it will not be many years till the railway journey from New York to Panama will be accomplished, and also when it will be possible to go by rail from Buenos Ayres to Lima in Peru. By the time this becomes feasible it is more than likely that further progress will be made in railway building from Peru northward toward Ecuador and from Panama south through Colombia to Ecuador. It also will be possible to cross the Andes from the Atlantic to the Pacific—that is, from Buenos Ayres to Valparaiso.

Skeptics who deal in general doubts and decline to recognize concrete circumstances always will scout this idea of a Pan-American Railway. Those who have faith will seek for detailed information. In making an official report as late as March of the present year, I had occasion to comment on the plans of the Chilean Government for piercing the Andes and to make a statement of the legislation that had been enacted for that purpose. This information was met with the objection that political reasons would keep Chile from opening up through railway communication with the Argentine Republic, and that the motives which for a third of a century had prevented the consummation of the plan would prevent it for another third of a century or even a full century. The objection had hardly been given publicity when the cable brought the news that the Chilean Government had awarded the contracts to English and United States firms for tunnelling the Andes and closing up the railway gaps.

The Peruvian Congress passed a law establishing a permanent railway guarantee fund out of the tobacco tax and also providing for the survey of various routes. The objection was raised that the law was mere sentiment and that no survey would be made. Actually the engineering corps were sent into the field by the Peruvian Government within a fortnight after the passage of the law.

These are mere illustrations, but they may serve to show in a quiet and practical manner railway progress in South America and especially that progress as related to the intercontinental project is real.

WASHINGTON, D. C.

Literature

Actual Government*

SINCE Alexander Johnson we have had no historical writer of promise and attainment equal with Dr. Hart, whose record is even now considerable. It would be interesting to know how much inspiration and incentive Professor Hart had from his master, Dr. Von Holst, under whom he took lectures at Freiburg, for in Von Holst's researches it was his frequent complaint that his material was unsystematized and difficult to find. Dr. Hart seems, thus far, to have chiefly devoted his attention to this very matter of bringing order out of chaos and directing attention to original sources.

"Actual Government" is, primarily, a text book. After needlessly apologizing for bringing before the public another work on the United States Government (would that he had left out from the copious bibliographies a score or two of slumbrous books, and thereby made the apology still less needful), the author states his aim, which is to show our governmental system as a whole, introducing the State governments and local governments as integral parts of one American Government; and he further says that he is not advancing a treatise, but an attempt to describe the Government as one might undertake to describe a great railroad. He has accomplished his aim.

Professor Hart's bibliographies, which are quite full and briefly critical, are useful as preliminaries to the book. Particular praise is to be given to this feature here. Why, however, in noting the general value of the works of public men, the diary of Maclay and the letters of the two Shermans are particularly spoken of, while Washington and Sumner, and, above all, the Nicolay and Hay "Lincoln," are omitted, it is difficult to understand. And here, too, among works on Constitution making and texts, "The Federalist" quite ranks in importance with Miss Hill's admirable "Liberty Documents" and John F. Baker's "Federal Constitution." A bibliography is a matter of selection, and yet it is of great importance in a work so generally admirable as an outline and starting point.

The work is very comprehensive, as indicated by the general titles: Fundamental Ideals; The Will of the People; State Governments in Action; Local Governments in action; National Government in Action; Territorial Functions (and here of colonies); Financial Functions; External Relations; Commercial Functions; and General Welfare.

So far as possible the endeavor is to show our Government in action in its various branches. In the chapters dealing with the judiciary, for example, we find an illustration of Professor Hart's principles. His sketch of the Federal Judiciary, and his brief hitting off of the character and work of the various judges, as in Taney's case or that of Chase; and then the tracing down of the Federal Judiciary authority through the Circuit and District courts, sketching the method of procedure and outlining jurisdiction, all this is admirable. The State Judiciary is dealt with in an equal manner.

The chapters on City Government might be taken as a monograph for study in our higher schools, for the subject is one that, with the quick growth and changes in our cities, we are recognizing as of nearer, if not greater, importance than national. Is it not a curious comment on the variety of spirit in our country that the Minneapolis City Council licenses astrologers and clairvoyants, while there is such a strong movement here in New York to drive out soothsayers! Along with the section on City Government might well be bound the chapters on Taxation, Public Finance, Education, Religion and Public Morals and on Public Order—including Charities, Police and Health. Here one has, treated as a living topic, the government with which one comes immediately and constantly in contact, and which certainly should be clearly understood by

* ACTUAL GOVERNMENT AS APPLIED UNDER AMERICAN CONDITIONS. *By Albert Bushnell Hart, LL.D.* New York, London and Bombay: Longmans, Green & Co. $2.00.

every citizen, if it can be made so without loss of national feeling.

The Issue*

THE scene of this story opens among the homestead hills of Virginia in 1831, and the initial chapters give a new impression of life upon these monarchical plantations; besides showing for the first time the birth of the spirit of liberty among the slaves whose cause was taken into other and more efficient hands after the death of John Brown at Harper's Ferry. And while the latter part of the tale is more brilliant in conception and execution, nothing written of the negro during this period is more psychically accurate. He could not think liberty, because his mind was not sufficiently developed rightly to conceive it; he could not imagine justice, because he had never known it. But being a man, his very instincts led him to demand it. It took the form of a ferocious superstition, a revelation he got from the frightful, Caliban god of his darkened mind—to slay the whites. And in the small massacre so graphically described in this volume we have the first inarticulate cry for liberty uttered thirty years before the Civil War by the slaves in the South. It was a sort of madness that worked like leaven into the ethics that inspired the most nobly sentimental war ever waged by mankind.

But the book contains other notable features. There is some portraiture of great men in it worthy of appreciation. We all know the part such characters usually play in historical fiction. They are the painted figureheads of the tale, the busts of heroes about which the author gathers his readers. They do not really live, they are simply historical. But in this novel we are brought into human touch with such men as Webster, Clay, Calhoun, Lincoln and others. The difference in their personalities is as plainly portrayed as is the difference in their views and ambitions. To accomplish this without destroying the dignity of our ideals of these men is no common literary achievement.

But that which distinguishes the book from an artistic point of view is the battle scenery. There is too much facility in mere talent, but genius may sometimes afford the gravity of awkwardness. And this is suggested by the heavy tread of armies marching through this story. They do not move with the phantom ease and swiftness that so often characterize the fighting lines in historical romances. But one feels the effort, the weariness of great movements, the shock of forces that are tremendous and real. And when the battle is on there is no operatic effort made to imitate the noise and confusion of it in hysterical, blood splashed sentences. The author's language takes on the simplicity of a mind dealing with great events. The horror moves on page after page, with maddening eddies of darkness and silence in it, where bloody men lie down to rest, and rise again, haggard and grim, to renew the strife like demons. Robert Chambers's description of the battle of Sedan in "Maids of Paradise" is the only war canvas that has appeared in years which surpasses Mr. Morgan's descriptions of the great battles where *The Issue* between the Northern and Southern armies was really decided.

It goes without saying that in a novel of this kind there is no appeal to sectional prejudices. The author includes much historical material that has never been used before in fiction, but it is well handled. Several love affairs are etched along the sunny margins of the great picture, of course, and in many particulars it is the most interesting work of fiction dealing with this period ever published.

Criticism by Paradox

SURELY the most remarkable of the ten volumes thus far issued in "The Popular Library of Art" is the little book just to hand, in which that newest master (or shall we say slave?) of paradox, Mr. G. K. Chesterton, treats of George Frederick Watts, R. A.,* the English painter, whose long life of quiet living, high thinking and wonderful achievement ended only a few days ago. He treats also of other men, in vivid side flashes, and of many, many things; of morality, theology, philosophy, Christianity, paganism, the Celt, the Greek, the last century, of heroes and hero worship. The

* THE ISSUE. *By George Morgan.* Philadelphia: J. B. Lippincott Company. $1.50.

* G. F. WATTS. *By G. K. Chesterton.* London: Duckworth & Co. New York: E. P. Dutton & Co.

little book is not a biography. One might say it is only incidentally an art critique. It is an essay, or a sermon, on "things in general"—on life, on psychology, on art, on literature—with the spirit of Mr. Watts, as evidenced in his pictures, for a text. It is filled with remarks that are original, brilliant, paradoxical, sometimes startling. It is exasperating at times, almost profanity provoking, but in spite of this it is fascinating.

There are at least three essential points, says our author, on which Watts was at one with the nineteenth century—and completely out of accord with the twentieth—making him one of the most conspicuous exemplars of Victorian idealism. These are:

"First, the skeptical idealism, the belief that abstract verities remained the chief affairs of men when theology left them; second, the didactic simplicity, the claim to teach other men and to assume one's own value and rectitude; third, the cosmic utilitarianism, the consideration of any such thing as art or philosophy perpetually with reference to a general good. They may be right or wrong, they may be returning or gone forever; theories and fashions may change the face of humanity again and yet again; but at least in that one old man at Linnerslease, burn, and will burn until death, these convictions, like three lamps in an old pagan temple of stoicism."

Watts's achievements are his allegories and his portraits. He has always painted "like one upon a tower looking down the appalling perspective of the centuries toward fantastic temples and inconceivable republics." "He is meek, but he claims to inherit the earth." His allegory, according to Mr. Chesterton, is not literary. It is not the symbol of language, the symbol of a symbol; it is one symbol of the reality, and language is another. Portraiture he has raised to a level never before attained in English art, so far as significance and humanity are concerned:

"This man has attempted, whether he has succeeded or not, to paint such pictures of such things that no one shall be able to get outside of them; that every one should be lost in them forever like wanderers in a mighty park."

After much magniloquent praise, the author admits that the whole of Watts's work is not technically triumphant. He has often been in the dark.

"In such an hour the strange and splendid phrase of the Psalm he has literally fulfilled. He has gone on because of the word of meekness and truth and of righteousness. And his right hand has taught him terrible things."

The book is an admirable monograph. Mr. Chesterton thinks for himself, and he makes his readers think. Whether they agree or disagree with what he writes, they must admit that his writing is always interesting and stimulating.

Father Louis Hennepin's "A New Discovery." Reprinted from the London issue of 1698, with introduction and notes by R. G. Thwaites. Two volumes, with portrait and maps. McClurg & Co. $6 00.

If Father Louis Hennepin had been content with giving a truthful record of his real discoveries, his reputation might still stand as high as that of most of the explorers of his day. He was the first to describe, with the fullest details, the Falls of Niagara and St. Anthony, and nowhere can there be found a more vivid and picturesque account of the enterprises of La Salle and the manners of the North American savages at the time when they first came in contact with the white man than in his pages. This restless friar was, indeed, a wanderer by nature, a born explorer. "I was," he says, "passionately in love with hearing the relations that masters of ships gave of their voyages. I used often to skulk behind the doors of victualing houses to hear the seamen give an account of their adventures. The smoke of tobacco created pain in my stomach, while I was thus intent upon giving ear to their relations. For all that, this occupation was so agreeable and engaging that I have spent whole days and nights at it without eating; for hereby I always came to understand some new thing concerning the customs and ways of living in remote places and concerning the pleasantness, riches and fertility of the countries where these men had been." Unfortunately, the good Recollect Father was a most unconscionable liar, but he was *splendide mendax*, for his mendacity is always entertaining and sometimes delightful. His most audacious fabrication was his claim—ten years after La Salle's death—to have been the first discoverer of the mouth of the Mississippi. The proofs marshaled by Mr. Thwaites in his excellent introduction

to the work before us are overwhelming and show that Hennepin never reached the lower waters of the great river. But, altho there is hardly a chapter that does not exhibit him as an arrant braggart for whom truth had no meaning when a chance of self-glorification came in his way, this picturesque vagabond was a man full of resource, energetic, adventurous and hardy. His geographical and ethnographical descriptions are graphic and truthful, and add greatly to our knowledge of the North American interior during the last third of the seventeenth century. Besides the reader is protected by the abundance of the footnotes in the present edition. Mr. Thwaites is always lying in wait for the fascinating rogue, and trips him up remorselessly when he indulges in his cold-blooded plagiarisms and tarradiddles. We have little doubt that a Boy's Hennepin, done by a judicious hand, would be quite as interesting as a Boy's Marco Polo. The text is adorned with a number of illustrations, title pages and maps carefully reproduced in *fac-simile,* and the biographical notice is much more than a mere list of titles; it is a methodical and critical introduction to the sources, done with evident care and sure to be of great utility to students of this period of our history.

Morals: The Psycho-Sociological Bases of Ethics. By Prof. G. L. Duprat. Translated by W. J. Greenstreet, M.A., F.R.A.S. London: The Walter Scott Publishing Co., Ltd. Imported by Charles Scribner's Sons. $1.50.

Those who are interested in the scientific bases of Ethics will find much of profit in this book. It is a distinct contribution to the subject. The object of Ethics, as conceived by the writer, is not to determine *a priori* an end that shall thereupon be established as a moral standard for the evaluation of particular acts; but, rather, to utilize the analyses of human tendencies contributed by psychology and sociology with a view to establishing a hierarchy of such tendencies. In the critique of ethical methods of the past the psychological viewpoint is subtly maintained. The author emphasizes the subjectivity of various theories whereby the theory becomes a manifestation of the temperament of its expounder rather than the outcome of a scientific induction. Indeed, moral theory is recognized as furnishing data for a scientific Ethics to work upon. The test of an adequate moral theory is the possibility of its practical utilization. Under the caption, "Psychological Ideal," Professor Duprat makes use of contemporary psychological science. The detailed analyses of ideational types and emotional temperaments here find practical justification in consideration of the effects of such types upon character and moral temperament. The treatment is necessarily suggestive rather than detailed. The psychology of the criminal is treated sanely. Since morality is conceived as the possibility of a comprehensive synthesis, a systematizing of tendencies, impotence to make such a synthesis through emotional or intellectual instability would necessarily be fatal morally. From the sociological standpoint the tendencies that make for solidarity are emphasized. No theory that conceives man as an isolated individual can do justice to the facts of the moral life. The Ethics of both Tolstoy and Nietzsche are found inadequate. The former does violence to the natural tendencies of the human individual, as those tendencies are revealed by psychological analysis. Nietzsche, on the other hand, shows an inadequate conception of the relation of the individual to society. The Uebermensch, in fact, does not impose his scale of values upon a slave-people, but is himself the realized ideal of the people. Moral education must be determined by the psycho-sociological tendencies of the morally deficient. In proportion to the recognition of self-determinism as the only adequate conception of will-determination must society assume responsibility for the health of its members. This is the more necessary in that moral suggestion is essentially a function of society.

Bryan's Dictionary of Painters and Engravers. Edited by George C. Williamson. New York: The Macmillan Co. $6.00.

The third volume of the revised edition of *Bryan's Dictionary of Painters and Engravers* contains more than 250 new biographies, besides over 700 corrections of the old text. One of the most valuable of the additions is the

series of articles on Anonymous Masters, especially those of the German school, by Miss Ffoulkes, who has laboriously collected all available evidence and consulted modern German scholarship for expert criticism on mooted questions of authenticity. The monographs on different masters do not vary so much in quality as in quantity. The fact of the editor's being an Englishman may account for the undue amount of space given to English artists. It is a nice matter to discriminate between the relative merits of leaders of different schools of art, and personal proclivities do influence the most just of men, but it does seem out of all true proportion that the English Millais, who is chosen to represent the pre-Raphaelites, should have three and a half columns devoted to him, whereas the French Manet, who stands for Impressionism, is disposed of in half a column, and that Sir Frederick Leighton should occupy seven columns, while the great Millet is considered worthy of but two. Such is English provincialism. But in spite of this patriotic partiality the Dictionary is indispensable to all libraries and to every individual whose business or pleasure it is to be familiar with the lives of great artists.

The Castaway. By Hallie Erminie Rives. Indianapolis: The Bobbs-Merrill Co. $1.00.

There used to be a Byron legend, but we had supposed the world had grown a little hardened to the glamour of that misguided poet's life. Now comes a young woman, who makes him the hero of a burning lyrical novel,—a hero, noble and chaste, against whom an evil world has conspired to blacken his character. *O sancta simplicitas!* There is a wicked man in the book, one Trevanion, who goes about Europe disguised as "Milord," and with his debaucheries and madnesses deliberately fills the world with tales of Byron's reckless ways. The climax of absurdity is reached when the Countess Guiccioli enters the scene. The ingenuity with which the author sanctifies that very simple-minded lady is really an extraordinary study of psychology—wherein not the Countess, but her apologist, is the subject. Miss Rives has followed the main events of Byron's life pretty closely, but she has twisted almost every incident and every character out of recognition. It must be admitted that the book has a kind of double interest: First, in the cleverness exercised in making black appear as white; and, secondly, in the power of keeping the reader's curiosity awake to know whether she willfully misrepresents history or has been honestly blinded by a strange and belated form of hero-worship. As for us, we prefer Byron with all his frailties upon him.

The Geography of Commerce. By Spencer Trotter, M.D., Professor of Biology and Geology in Swarthmore College, Pennsylvania. New York: The Macmillan Co. $1.10.

This textbook is the first of a commercial series edited by Dr. Cheesman A. Herrick, Director of the School of Commerce, Philadelphia Central High School, and designed to cover ultimately the whole field of commercial education. It combines a study of the physical geography of different countries with that of their commercial and industrial conditions, and aims to show how the adjustment of men to their physical environment produces certain economic results. The book is elementary; but, tho it is a complete manual as far as it goes, it contains an excellent list of authorities at the end of each chapter by which the student can further pursue the subject. The main motive evidently is to acquaint the youth of our high schools, as well as more advanced readers, with the new importance of American commerce as a factor of world civilization; and, accordingly, a clear statement of the regional geography, resources and various departments of internal commerce of the United States is followed by an account of our outlying possessions and the wider trade outlook of the country resulting from expansion. An excellent feature of the book is the variety of its graphic illustrations. Numerous maps show the rainfall, the isothermal lines, the forest regions and the distribution of natural products of the different countries, as well as their predominant and minor industries. The position of this country in the world's markets is also graphically illustrated, together with its prospective development under the new political expansion.

Ethics of Democracy. By Louis F. Post. New York and Chicago: Moody Publishing Co.

That Henry George is still a living force, able to call forth the energy and enthusiasm of men, is evidenced by this brilliant book of Mr. Post, probably the leading exponent of Single Tax ideas in the country. Vitalized by the zeal of the reformer, and strengthened by a keen critical intellect, the *Ethics of Democracy* will do much to encourage that small but vigorous band of men who, deemed dangerous by conservatives and half-hearted by ultraradicals, nevertheless consider themselves as "root-and-branch" reformers. It is a book of not one, but many, ideas. Written for the purpose of presenting the principles of Single Tax, it affords insight into the general social theories of its author and the movement he represents. Five of the seven parts into which the book is divided consist of an examination of the principles of democracy and its various institutions, universal suffrage, the jury system, etc., and an arraignment of modern economic and social tenets and practices. Mr. Post is an optimist, but he sharply distinguishes his optimism from the kind that rocks itself to sleep on "whatever is, is right." In his attack upon the ethics of modern business life and consequent political corruption he maintains that great fortunes cannot be made honestly, for if the dishonesty is not individual it is social in permitting an individual the economic taxing power that wealth commands. The economic tendencies of the day—business concentration, the trust movement—are viewed from the same standpoint, and the relation of Single Tax to Socialism presented. In his analysis of politico-economic tendencies, free competition, the wage system, foreign trade, various economic principles, he points to the Single Tax solution as the only salvation from moral and economic disaster.

How to Know Oriental Rugs. A Handbook. By Mary Beach Langton. D. Appleton & Co., 1904. $2.00.

Armed with opportunity and taste, together with an almost equally useful factor, enthusiasm, Mrs. Langton has produced an account of the Oriental Rug in its history and variety that adds immensely to one's keenness on the subject and weaves it full of romance and lore. Through her eyes one sees the Persian and Turkish women, each with a soul for art, patiently working long hours each day for years for ten or fifteen cents a day. So we may buy for a hundred dollars or less three years of the weaver's life. Aside from its beauty, almost every line of a fine rug means something to the maker and to the initiated, for into it are woven the religion and poetry and mysticism of the Unchanged East. The curious repeated figures, the little "Noah's Ark Animals," the symbols of life's greater interests, the passages from the Koran, taken alone or in the complete rug, they all mean something. Mrs. Langton gives us the key to this symbolism, and one might well follow the example of the Moslem and walk only with bared feet on the Kermanshah. After the "Story of the Rug"—a short story and worth attention in this era of short stories—alas! so often their chief is a plot to get money—the value of the book lies in the chapters on the Persian, Caucasian, Kurdistan, Turkish and Turkoman species, not forgetting particular attention to Indian and Chinese rugs. Some fifty varieties are described. How they are woven, or, more strictly, how they are knotted, for they vary from forty to eight or nine hundred knots to the inch, the peculiar dyes used, effects of the climate and of character—all this is curious knowledge and it trenches hard on the folk lore of the land of Hafiz and Omar, a land whose art and thought are clearly not in verse alone.

Literary Notes

A NEAT little volume of authorized selections from the poetical work of Sir Lewis Morris is published by E. P. Dutton, New York, for 75 cents, in limp leather binding.

...."Recent Literature on Interest (1884-1899)," by E. v. Böhm-Bawerk, is a supplement to the author's "Capital and Interest," and discusses the criticisms of his theory of interest and the substitutes for it which have been proposed (Macmillan's, $1.00).

...."As a Chinaman Saw Us" (Appleton & Co., New York, $1.25) is a sharp and somewhat amusing criticism of American society, politics and civilization, but there is nothng in

it to indicate that it gives the Chinese point of view.

....A summary of the leading American Decisions on the law of copyright and literary property, from 1801 to 1903, together with the United States law, compiled by Arthur S. Hamlin, is published under the title of "Copyright Cases," by G. P. Putnam's Sons. New York, $2.00

....An account of the prosecution of Theodore Lyman for criminal libel by Daniel Webster, for charging him with having conspired with other leading Federalists in 1807-8 to break up the union and reannex New England; is published by C. E. Goodspeed, Boston ($3.50).

....William McKinley will stand in American history as the personal exponent of the policy of protection, and since, in spite of all efforts to the contrary, the tariff is and will remain a real issue in our politics, it is fortunate that Putnam's have republished the essay on "The Tariff in the Days of Henry Clay and Since," written by McKinley in 1896, a few weeks before his nomination for the Presidency.

....The International Studio publishes as a special summer number a history of the Royal Academy from Reynolds to Millais, edited by Charles Holme (John Lane, New York, $2.00). It is elegantly printed, with nine plates in color, seven in photogravure and numerous other illustrations. Interleaved are *fac-simile* autograph letters of prominent members. The volume is of value both as a history of British art and as a work of art in itself.

...."The American Immortals" is a handsomely printed book containing biographies of the twenty-nine men who were selected to have their names inscribed in the Hall of Fame of New York University. The names are arranged in ten classes: Men of the Revolution, Statesmen, Jurists, Men of the Civil War, Men of Letters, Preachers, Philanthropists and Educators, Inventors, Artists and Naturalists. The lines are written by George Cary Eggleston and illustrated by excellent portraits. (G. P. Putnam's Sons, New York, $3.50).

....Persons afflicted with rheumatism, whether they are patients or impatients, should read Edward S. Lent's amusing narrative of his sufferings at the hands of physicians and metaphysicians of all degrees and some without degrees (published by the *Brooklyn Eagle*, $1.25). Mr. Lent speaks from experience, since he has been blistered and bathed and dosed and electrified and demonstrated upon in all the ways known to medical science and nescience, with very little advantage to himself, but much to the pleasure of readers of the book.

Pebbles

College Girl: "Oh, how my watch annoys me, ticking under my pillow." *Her Chum:* "Why don't you get one of those silent midnight watches?"—*Life*

...."There's one thing I can't understand about Parker." "It seems to me he's made his position plain enough." "He has, as far as he could, but it doesn't appear that a gypsy fortune teller ever informed him when he was a boy that he would some day be greater than a king."—*Chicago Record-Herald.*

....The standard Fairbanks story, which he can tell with much gusto, bears repetition because it is illustrative of several matters: "I was campaigning in Iowa with Governor Gear," said Senator Fairbanks, "and one night Joe Blackburn, of Kentucky, was in the audience. He happened to be making a campaign on the other side. After the meeting he met us and proposed to step into a convenient place and get a drink. I was very tired with my effort and the suggestion struck me most favorably. 'What will you have, Governor?' asked Mr. Blackburn. Governor Gear was thoughtful for a moment and then replied: 'I think I'll have a glass of mineral water.' 'Fairbanks, what do you want?' asked Blackburn. 'I should like a glass of milk,' I replied. The waiter stepped forward and looked inquiringly at Mr. Blackburn, whose face wore a peculiar expression. 'Oh,' he remarked, with extreme disgust, 'bring me a piece of pie!'"—*Pittsburg Dispatch.*

....With patriotic effusion, I send you my greetings and congratulations, and congratulate myself as well on this day of grateful impressions that is to make an epoch in the annals of our contemporary history. It is necessary not to forget that if the restoration, without asking where they come from, accepts all who wish spontaneously to serve its cause that a rule of its program is the purity of the doctrine and the pulchritude of the proceedings. Every one of you carries undoubtedly in his conscience, shaken still by the past storm, a painful vibration; every one of you brings, as gathered in the ambient air of the localities, a strange blast that shakes up his spirit with emotions consisting at the same time of grief and comfort, and thus, by virtue only of this alternative, your souls of patriots ought to have found the true orientation of the providential purposes. But many souls did not keep faith in that emergency at any risk predominating of an authority energetically steady and always decorously dressed out by the honor of the person who exercises it; many spirits hesitated, or were overflowed by the muddy waves of the disaster, that had all the phases, all the aspects of great desolations, etc.—*From the recent address to Congress of President Castro, of Venezuela.*

Editorials

The Democratic Ticket and Policy

The Gold Democrats have returned to their party and will vote for its nominees. Proof of this is seen in their presence and influence in the recent convention, in the utterances of the powerful journals that have represented them for eight years, and the published opinions of their leaders. Some who began to vote for the Republican ticket in 1896 will be Republicans for the remainder of their lives, but a great majority of those who were repelled by Mr. Bryan and his platform will now vote for Parker and Davis. They have been moved by a consuming desire to renew their allegiance to the party. Judge Parker's telegram opened wide for them the door that was already ajar. In their eagerness to return and in their rejoicings over the conditions that permitted them to do so, there is some political significance of the practical kind, which their opponents cannot afford to overlook. It is Mr. Bryan that now finds the situation an unsatisfactory one, but he is to vote for the ticket. Those who stand with him will vote for it. The Republicans will be confronted at the polls by a united Democratic party.

Considered with respect to existing conditions, Judge Parker is almost an ideal candidate. He has not offended any one by declining to vote for the party's nominees in the last two campaigns; at the same time he is the choice of those who did decline so to vote, and he is committed to the support of the gold standard. His character, his career, and his opinions, so far as these have been disclosed, deserve and demand the respect of all good Americans. One cannot study the life work of this man, his early struggles against adverse conditions, his steady advance in the profession which he now adorns, his disregard for the accumulation of riches, his modesty, and the healthful simplicity of his manner of living, without feeling that here is an American of the best type and of the kind that the American people have delighted to honor. His telegram was the fruit of an impulse which such a man could not avoid. He did not ask for the insertion of a gold resolution in the platform; he desired that the convention should not be misled, and he was willing to take the consequences. There was in this the courage of an honest man, not twisted by ambition. It was too late for such a message to deprive him of the nomination, but this he could not surely know.

We would not minimize the merit of this act, but it is not impossible for a man like Judge Parker to have some knowledge of current politics. The press of his party in New York has been saying that the cause of his party would be hopeless if neither its platform nor its candidate should say a word for the gold standard. It had said this emphatically that very morning, and had urged him to make good the great gap in the platform. If his action was determined in part by this urgent advice, as well as by his own view of the course an honest man should take, this is not to his discredit. Moreover, not until that Saturday morning did he ascertain that the Williams money plank had been rejected.

The Democratic party sets up against the forcible and admirable personality of Mr. Roosevelt the not less admirable personality of the Chief Judge of New York's highest court. The two men are personal friends. We shall not now compare their qualities. So far as the campaign shall turn upon the character and careers of the two leading candidates, it will be concerned with men of blameless lives, high ideals and unquestioned patriotism.

Ex-Senator Davis is also a man who has achieved great success by his own exertions and ability, making his way upward from small beginnings. The evidence of his success is seen in the accumulation of great wealth and the exertion of a commanding influence in commercial affairs. But the nomination of a man 81 years old was a blunder. His name weakens the ticket, except in West

Virginia, where it may reverse the vote of the State, and in Maryland, where his power, together with that of his cousin, Senator Gorman, may cause a similar change. Mr. Davis's views concerning the tariff are like those of his cousin, which are not approved by a large majority of his party in either the radical or the conservative section. His attitude toward the Trusts is that of the multi-millionaire capitalist, whose fortune has been derived from railroads, coal mines and the iron industry. It is this nomination, rather than that of Judge Parker, that tends to confirm Mr. Bryan's assertion that the convention was controlled by plutocratic influences. We believe there is very little difference between Mr. Davis's political creed and that of his Republican son-in-law and business associate, Senator Elkins.

We shall not begin to see clearly the dominant issues of the campaign until after the publication of the candidates' letters of acceptance. The currency will be an issue, so far as the Republicans can make it one by their attacks upon the action of the St. Louis convention and its Platform committee. Mr. Bryan may give them some assistance. Silverism is dead, but the Democratic party must expect to suffer in debate for avoiding any reference to that fact in its platform.

The most important questions of domestic policy now before the American people are those which relate to the recent and enormous increase of individual and corporate wealth and power by means of special privileges, combination, and evasion of law, and to the influence of this power upon legislation and government. It is because of the relation of the tariff to this power and wealth, rather than on account of differences of opinion as to the expediency and equity of protective duties, that the question of tariff revision appeals to the masses. For similar reasons, the public is and ought to be interested in projects for the restraint of great Trust corporations and for the supervision of railroads. We are inclined to expect that in some form these questions, to which all platform utterances concerning the tariff, the Trusts and the powers of the Interstate Commerce Commission directly relate, will be the dominant issue, altho with many the personality, impulses and tendencies of Mr. Roosevelt and Judge Parker will be paramount.

The tariff should be revised, with special reference to those duties, no longer needed for real protection, that have become mere instruments of greed and extortion. These are the duties under the shelter of which there have been formed those combinations that in their prices greatly favor the foreign buyer at the expense of American consumers. It is against such duties that the attack should be directed. Mr. Bryan, whose earnestness, frankness and courage have frequently excited our admiration, blundered when he caused to be inserted in the Democratic platform the declaration that "protection is robbery." Not under such a banner is successful assault upon the evils and abuses of the present tariff to be made. Nor could a successful campaign against the money power be conducted upon a platform calling for the free coinage of silver at the ratio of 16 to 1. Mr. Bryan has yet to learn that it is folly to contend against great and strongly intrenched evils in these days with the discredited and worthless weapons of medieval times or half civilized peoples. In the use of such weapons he has wasted much energy and caused much disturbance, ending with increasing the evils he sought to abolish and the power he hoped to overcome.

His weakness in this respect has been also the weakness of his party. The remedies proposed by it under his direction have been justly regarded as worse than the disease to which they were to be applied; or the treatment suggested was believed—partly as the result of experience—to be that of an inexpert enthusiast rather than the deft work of an educated and skilful surgeon. To accomplish a repression of the evils to which we refer, Mr. Roosevelt is inclined to go further than the policy of other Republican leaders will permit. If the Democratic party is to make any real progress in an assault upon them, it must be led by some one having not only Mr. Bryan's earnestness, sincerity and personal influence, but also that full knowledge of the nature of the evils and the causes of them, and that ability to select and use the most effective methods for attacking them, which he does not possess.

The Late Mayor Jones

With the death of Toledo's Mayor, Samuel Milton Jones, a figure unique in American public life passes from view. In a day when political success seems hardly possible without a disregard or a sacrifice of ideals, without barter and compromise, this man lived out his ideals, stedfastly refusing to barter or compromise, and yet was four times elected to the Mayoralty of a large city, three of these times against the fiercest antagonism that an organized opposition could wage. He declined to make his peace with the political machine, and the machine in turn sought to destroy him. He stood resolutely against the rapacity of great corporate interests, and these thereupon leagued themselves with the machine. And he refused, over and over again, to take any steps, or to permit his friends to take steps, toward the building up of an organization for the safeguarding of his political future. Yet in spite of the opposition of the machine, of its subservient press and of the corporations, and in spite of an entire lack of organization, he repeatedly discomfited his enemies at the polls. He had the confidence and love of a great part of his fellow-townsmen, which he retained to the end of his life, and so supported, he could afford to ignore the machinations of his opponents.

Born in poverty, his youth and early manhood were passed in a hard struggle for a livelihood. His education was meager, comprising some thirty months of schooling up to his fifteenth year. At fourteen he was a wage earner, and at twenty-four he was in business for himself. What the world calls "success" came to him, and he prospered. But to no man did success in business ever give less satisfaction. With his acquirement of wealth he came to a realization of the great burden of social distress that rests upon all communities—the disemployment, the poverty and the hunger that everywhere attend the industrial development of the race. He was by nature religious, and it was a religious rather than an ethical sense in him that was shocked by the needless misery that makes its home in the great centers of population. That some men should be wealthy while others were destitute seemed to him a profanation of divine law. With the Socialists, he blamed the capitalist system, with its wage labor and its profit making, as the cause of social distress, and he therefore waged warfare against that system.

His practical benevolence was notable. He treated his employees with an unmatched liberality, and he gave generously to the poor. Yet mere philanthropy he denounced unsparingly. It was, in his view, an unctuous giving back of petty doles out of the great wealth gained at the expense of other men. He was sincerely ashamed of being a rich man; and those who knew him intimately believe that had it not been for his family obligations he would cheerfully have renounced his possessions.

Yet despite his virtues, despite his passion to do good, it must be confessed that the practical effect of his life and work will be but a faint impress on the future of society. Much of his good, in the Shakespearean phrase, will be interred with his bones. The reforms he was able to effect in the municipal administration of Toledo were few and of small fundamental import. He leaves behind no organized movement to carry on his work, no institution to embody his principles. With his death the city of Toledo goes back into the clutch of the machine. And the reason is not far to seek. The growing ascendancy over him in his later years of the Tolstoyan philosophy effectually blinded his vision to the practical work he might have done. Tolstoyism, tho it has a social bearing and a social ethic, is essentially individualistic and passive. It views mankind, it is true, as the children of a heavenly father, owing duties to one another through that relationship. But it views them as a multitude of separate units, and not as the inseparable components of a great social body. Of the social body—that tremendous and complex mechanism which is the evolution of countless ages—it has no concept. Its appeal is to the individual against the aggregate of which he is but an insignificant and generally pow-

erless fraction. It asks him to refrain from force in a world of force and oppression, to disarm among armed men, to renounce possessions where all must, in the very nature of things, seek to possess. That the only possible social progress lies in the perfecting of the social mechanism, and not in the futile attempt to escape from it, is a truth which Tolstoyism avoids or does not see.

This philosophy grew upon Mayor Jones in his later years, blending with his earlier collectivism and producing a somewhat curious complexity of view. Tho still able to recognize an intrenched capitalist "system," he seems to have concluded that its elimination or correction would most likely be achieved only by individual practice following upon individual exhortation. And so the powers which he had, and the greater powers which he might easily have had, as Mayor, were slighted, and the institutional reforms which another in his place might have effected were left to time and chance. He was a great and a good man, sincere beyond most men, democratic in his friendships, simple in his tastes, warm hearted and generous. And tho in accomplished work of an enduring kind he failed, the inspiration that flows from so noble a life remains with us as an eternal heritage.

Love Before Marriage

THAT romantic love is a species of insanity is an old theory; but, since it has been again promulgated by a New York clergyman in a recent address, public attention has been directed to it and it requires consideration.

Romantic love is not a form of "insanity," as it has been so often called, but it is an inspiration, and the lover is an idealist. He is a young Columbus seeking his feminine hemisphere, and we are as sensible in calling him a "lunatic" as the fifteenth century wiseacres were in calling the discoverer of this country a fool. Having studied the chart of his heart the lover finds himself short one Eve in dimensions. Insanity would consist in never recognizing the defect or attempting to remedy it.

Besides, during this period of adolescence the mind no less than the body undergoes a profound change. Love is only one of the evidences a young person shows of his evolution in the scale of things. With children, intelligence is prismatic, love an unenlightened affection, piety an unsophisticated obedience to spiritual laws they do not really comprehend. Not until after the age of puberty is the youth capable of *personal* comprehension, of an intimate psychic relationship to himself or to others. When the shock comes he is startled into a different sense of things. However dull he may be naturally, during this quickening human springtime his mind leaps into action, winged with a thousand mysterious suggestions. He is like one rising from the sweet somnambulance of innocency. It is day break for him. And in this first keen light he receives an emotional impression of the heavens and the earth. He becomes a rainbow thinker because he is young and new and belongs in the substance of his spirit to this highly colored region. The fact that he becomes the poet laureate of some woman's charms during this inspired period is only one evidence of the change in him. Besides being a lover, he is also a fledgeling philosopher and a prospective priest, for every young man gets a sentimental call to serve before the altar during this initial time. His consciousness ends in God by a sort of divine conceit.

So far, therefore, from calling any part of such an awakening "insanity," it is a duty to teach that love is a gifted form of sanity. It is a normal ecstasy as beautiful as the blossoming of a rose, and as much in the right order of things. For they are mistaken who suppose that the religionists have appropriated all the goodness there is; honest love is a righteousness of nature, a sincere fulfilment of the prophecy of life, as sacred as prayers or fasting. Moreover, it is not simply the begetting genius upon which the quality of posterity depends, but it is the heavenly power of illusion we have toward one another. It is the grace by which imperfect, hard featured humanity is exalted into beauty and perfection. Without it the meanness of men and the homeliness of women would be unendurable. Above all, we degrade the consciousness of youth when we define

love as a sort of physical insanity, and pave the way to license and immorality. We are getting too much disillusioning knowledge about ourselves these days, anyhow, and we talk it too plainly before the children. Young people are no more like old ones than pansies and "sweet williams" are like thorn trees. But we are not satisfied with their kingdom of heaven simplicity; we call their misdirected energies, their inexperience, their natural experiments, sins; we brand the frank love of youth as an insanity and think we are instructing them. So we are, in precisely the same manner that the serpent instructed Eve, and with much the same result.

But love before marriage leads naturally, tho unfortunately not always inevitably, to love after marriage. This still more important question we must reserve for next week.

Balfour's Blunders

THE present British Parliament is approaching the end of its term. History will give it no honor. It is owned by the Tory Conservatives, and it has done and is still trying to do their will. It was elected in the heat of the South African war and elected wholly on that issue. It was confessedly and solely a Jingo campaign. The appeal was made to the country to ignore domestic issues, and consider only the necessity of bringing that war to an honorable conclusion. Accordingly Churchmen and Dissenters, Conservatives and Liberals, were besought to sink their differences and patriotically to support the party and Government which had conducted the war, and give it a mandate to conclude victory and peace. The electors were given clearly to understand that no other issue was before them. Speaking in Manchester in October, 1900, Mr. Balfour said:

> "Whatever your politics may be, or to whatever party in the state your allegiance has been given, remember that this election does not turn on any of the old questions that have divided the electorate in previous elections."

Such declarations by responsible leaders could be multiplied indefinitely. They were quoted the other night by Mr. Asquith in the House of Commons, and Mr. Balfour heard them in silence. They pledged his Government to bring in no new divisive party issues.

The war ended and peace was concluded. A great South African state is assured. But the Conservative pledges were soon broken. At the command of the Established Church an Education Act was passed, detested by Liberals and Nonconformists. This could be done because an enormous majority in the House of Commons gave Balfour's Government the power where it did not have the right. The result has been such a demonstration as has hardly been seen since the days of John Hampden, who said it would not have ruined him to have paid that twenty shillings, but it would have made him a slave. Thousands of men, led by their noblest ministers, have refused to pay taxes for religious teaching in Church schools, which they could not approve; their property has been seized and sold at auction to pay the religious tax, and venerable men have been sent to prison like John Bunyan. Every day's journal tells the tales of distraints all over England. No wonder the people are angry and every bye-election shows serious loss to the Government.

And now, rendered desperate by their waning strength, the Tory Government is putting through, by wholesale closure, shutting off full debate and stifling hundreds of amendments, a bill, generally known as the Brewers' bill, which rouses the indignation of all the temperance reformers and all the Nonconformists, and of a considerable section in the Church of England. Under a late previous law the local magistrates had the right to refuse licenses for the sale of liquor where in their view the community was already sufficiently supplied with saloons. There has been a great awakening in Great Britain of the public conscience as to the evils of intemperance, and in Birmingham and many other places the magistrates refused to issue many licenses for which the brewers applied, and refused to renew other licenses. This stirred the indignation of the brewers, who practically own the public houses and let them to their agents. They brought a case before the courts, claiming a vested right in the business of a public house, which was wrongfully destroyed by the refusal to renew a license.

The judge decided against them, saying that the right expired with the year of license. Appeal went to the House of Lords, and finally to a Judicial Commission, but in each case the brewers were defeated. Then, the law being against them, they told Balfour's Government that the law must be changed, and a vested right must be created. This the new bill does, and a most iniquitous bill it is. It takes the power of refusing license from the local authorities and puts it in the hands of a small county commission, which will be dominated by the Tory squires. Further, no reduction can be made without giving compensation to the publican, which means the brewer who owns the publican, for the loss of his business. Of course, this recognition of a vested right to sell liquor vastly increases the value of the business in any transfer. It has been computed that it adds a value of $1,500,000,000 to the "Trade."

Now, the purpose of this bill is clear. The brewers are, with the Church, the bulwark of the Tory party. The public houses will supply an enormous vote. That vote will be assured to the Tory party in the coming election. Without it they will be overwhelmingly defeated. It gives them their last hope of success. The Balfour Government is sold to the Breweries. This bill must be passed now or never. The coming election will make it impossible to save the saloons, for that requires an overwhelming Conservative majority. Pass the bill, and it will take long to repeal it, for the House of Lords stands in the way.

The bill passes, by the aid of vigorous closure, and once more it raises a bitter division in the people of England. The conscience of England is as hot against it as against the Education Act; and, fortunately, the Established Church is not a unit in its support. At the meeting of the Representative Church Council just held the majority of the Bishops, after a long discussion, voted 12 to 7 to disapprove the bill, and the Archbishop of Canterbury and the Bishop of London found courage to support the bolder Bishops of Hereford and Salisbury in their opposition. But the clergy, by 87 to 37, favored the bill, as did the lay members, 63 to 15, and gave it a large majority on the united vote. Still we have an assuring sign indicating that it may not long be true that in England the Church and the brewery shall hold loving fellowship.

The Effect of the War on Russia

THE opinion expressed by M. Kniajnine in this issue that the war will result in the weakening of governmental absolutism in Russia is receiving daily confirmation. Already it is announced that exile and imprisonment by administrative process will be done away with, and that no punishment will be inflicted without legal trial. This abolishes the worst features of Czardom, the system of arbitrary arrest and condemnation of political suspects, which has excited the indignation of the civilized world and formed the tragedy of innumerable novels and melodramas. Considered merely as a penal measure there is much to be said in favor of exile and forced colonization as an alternative to imprisonment. It was the high character of many of the political "criminals," the secret arrest on information of spies, the sudden banishment without trial or opportunity of defense, the hardships of the journey, the difficulty of appeal and redress which have made the Russian exile system the synonym for cruelty and injustice. If this has in truth been abolished, it is like the fall of the Bastile in France, for it is questionable whether it is not necessary to the autocracy.

Three causes are now contributing to the growth of disaffection among the people: the heavy financial burdens laid upon them by the Russian occupation of Manchuria, the failure of crops and the falling off in trade and manufacture, and the inefficiency and incapacity shown in the Russian military operations. The Trans-Siberian Railway cost over $500,000,000 and so far it has not been used for much except the transportation of troops and their supplies. The magnificent docks and buildings of Dalny are now in the hands of the Japanese. The Russian war ships in Port Arthur are valued at over $150,000,000, and there is no way apparent by which they can be long kept out of the hands of the enemy. Tolstoy may exaggerate the unwillingness of the Russian peasant to be sent to the war, but it can hardly be doubted that it is his

spirit of loyalty and custom of obedience which sent him to the front, rather than any enthusiasm for the cause, such as inspired him in the war against Turkey in aid of oppressed fellow Slavs.

Under these circumstances it is not to be wondered at that a desire for a change is reported to be common among all classes, including the court circle, and that unprecedented leniency is shown by the police toward expressions of dissatisfaction. In Warsaw 1,000 Socialists were permitted to march unmolested through the streets carrying red flags inscribed on one side "War Against War" and on the other "Down with Czarism." A copy of the constitution prepared by Count Loris Melikoff for Alexander II and which that Emperor is said to have been about to sign when he was assassinated has been recently presented to the Czar by an unofficial adviser. Still more significant is the fact that the censor permits the *Novoe Vremya* of St. Petersburg to publish an article containing the following bold words:

"Our people ought to have freedom. Our national organism is shattered, and it can only be repaired by the infusion of new blood—that is, by the central authorities and the bureaucracy allowing the healthy, popular will to assert itself. The present war is a terrible trial, but more terrible still is the moral weakness of state and society it has brought to light. We want more truth and more freedom."

The Busy Index

THE *Frankfurter Zeitung* of June 22d, 1904, states that the Index has added to its list the work of Abbé Houtin on Americanism and "Nostra Maxima Culpa," or "Die Traurige Lage der Kirche" of the parish priest, Vogrinec, of Kaernthen, Austria.

L'Abbé Houtin is no stranger to the Index, which had banned already his two works, "La Controverse" and "Les Questions Bibliques," as well as his public letter to his bishop. It is rather curious, however, that he rehearses nothing new. "La Controverse" touches upon the origins of the sees of France, as also upon its ancient shrines. "Les Questions Bibliques" is a *résumé* of the opinions held by Catholics during the nineteenth century. In both books his authorities, with hardly an exception, are Catholics of high standing. Houtin, however, pitted one author against another in a way which serves to bring out their crotchets, and, too often, ignorance. His crime lies in thus stringing together and laying before the public such hazy, unfounded notions of Church history and Biblical studies.

So again in his latest work, "L'Americanisme," Houtin brings into the volume the many discussions which have appeared in Europe and America over the Catholic Church in the United States, such as The Life of Hecker, Monsignor O'Connell's speech on Heckerism at the Freiburg Congress, the dismissal of Monsignor Schröder and resignations of Dr. Pohle and Dr. Peries from the staff of the Catholic University, Washington; the removal of Bishop Keane from its rectorship, and Leo XIII's letter on Americanism. Nothing is new, but the French Abbé has an uncomfortable way of putting two and two in such wise as always to make them equal four. If asked whether two plus two equals four we might answer: Hardly, but two plus two equals one hundred minus ninety-six. Something shifty and underhanded stands out in the second answer. But it is not Houtin's, who writes *four* in the deepest black.

Vogrinec in his preface apologizes for his German, as he is a Slav. His work probably was shipwrecked on his plea for the abolition of celibacy. We were aware that Cardinal Lavigerie had asked Rome to exempt the native African priests from the yoke of celibacy. A writer in *La Revue du Clergé Français* (October, 1902) refers to this petition and proves that Protestant missionaries in foreign lands are surer to succeed because they have wives, who make a home for them and so shut out the loneliness and homelessness which ever beset the life of Catholic missionaries. Nor is this the only comfort of Protestants, but—and especially so—the missionary career is in the eyes of all Protestants most noble and honorable, whereas, on the other hand, Catholic missionaries receive little encouragement from Catholics and are too often a laughing stock to their brother clergy at home.

Now as to celibacy, we have the best authority for saying that the first nails in its coffin have been driven home. Some,

if not all, of the bishops in the United States, so we have been told, have secret faculties to dispense deacons and subdeacons from celibacy. Hence, such youths as are unwilling to take the further step or are found unfit for the priesthood have a way of escape in this healthy dispensation. Moreover, we learned from trustworthy sources that when the Latin American bishops were in Rome some years ago they presented informally a request that celibacy be abolished in the lands south of the Gulf of Mexico. This was put aside. But the bishops of Latin America received faculties which authorize them to allow the valid and lawful marriage of a priest and his concubine when either is in danger of death. Now, as priests and their mistresses may get typhoid, pneumonia and other fatal sicknesses, and as many women when in child-birth are *in extremis* and yet recover afterward, it follows that, granted the aforesaid dispensation, a lawfully and validly married priesthood is the outcome. Of course, nothing of this appears in the published official acts and decrees of the Church in Latin America. It is all *sub rosa.*

The great merit, however, of Vogrinec's work is the catechism, which takes up a large portion. It is an honest effort to bring into harmony with the Church's teaching the results of biblical and historical studies. In a word, the Slav pastor of Austria carried out the wishes expressed some time ago by " Sacerdos " in the New York *Sun.* The author was careful to submit his work to the Church authorities of Vienna. Formal permission to print was not given, but Vogrinec was informed in an official note that the work was under examination. This probably was enough to warrant him to go on and bring out his book, in which he gives both his letter and the official answer.

The Secret of Success

A POOR young man from the country recently came to New York " to succeed in life." His intention was sufficiently large to include fortune and fame from any direction. But to make sure, he purchased a copy of Abraham Lincoln's biography, that he might regulate his course by the experience and precepts of a great man. This was logical, but what is logical is not always practical. He thought success was like the " piece " he learned to speak at school. Besides, he selected the wrong text-book. He was not a young Lincoln; even if he had been, there is no longer a demand for black locust rails in New York. And he failed, not because he was incapable, but because he missed his cue. Not only that, but he discovered that success does not depend merely upon virtue or principle. The wicked flourished like a green bay tree, and the good appearance they made at the business tempted him to cheat in order to win. But no one has thought to write a volume " entitled " The Men Who Fail," and so his ignominy is simply a matter of court records.

Meanwhile the fact remains that modern aspiration is founded upon the competitive instinct, and he is a sort of craven who dares not strip for the race. The very spirit of the times challenges him. It furnishes examples of pluck and energy, a whole library on " self-made " men—all of which the longing, unmade men accept with the confidence of sick people who buy patent medicine. And this is a very good way to learn the secret of other men's success, but it is at least an open question if any one ever made a fortune merely by following the precepts laid down in " Poor Richard's Almanac." For that is a business which depends more upon the man than the prophet. It is an original proposition worked out by each adventurer according to his ability. And no matter how sensational the story of his success reads in the next volume of the " Self-Made," he attained by main strength, by his own wit, and not according to the plan of another's achievement.

The one conclusion proved is this: To the shrewd man life is a game; to the ambitious, a race; to the wayfaring and the brave it is a battle, but for the successful man it is all these things. He is scarcely a Sabbath day's journey from the Arcadia of youth when the successful men who have gone before hurry out to meet him with a card up their sleeves. In such a situation the biographies of great men will avail him little if he cannot play the best game. Even then it is the cheapest kind of succcess. It simply demonstrates the agility of his mind and

the adjustable cleverness of his principles. Later comes maturer ambition. Success takes the fairer form of fame. He is in the race for her favor against many rivals, with a cloud of witnesses to herald the issue. But all this has to do with the appearance of things. The secret, the real photograph, of his success depends upon another matter. Let him win the game and finish the race with credit, there still remains the day when he must enter the lists to fight, not for gain or fame, but for himself, for what he is. Gone are all his competitors now, gone the crowd that cheered him. The very world takes leave of him, and he stands alone before the powers and principalities of his own darkness. How did it come to pass, this hour of destiny toward which all his games and races have hurried him unsuspecting? It is like an altar suddenly set up in his market place ready for sacrifice. In his heart every man knows the victory or defeat of days like these. But it will not be recorded in his biography, because to all appearances it does not count. But really it is the most secret and the most important thing to know about success. For it is the God hour, when a man recognizes the features of his own soul in his achievement.

Capital and Labor—The Point of View

The most certain indication that the problem of labor unions is in a fair way of adjustment is found when each side is able to see the issue from the standpoint of the other side. Recently the writer spent a week among the workmen and employers of a great industry, which has been completely unionized within the past five years. He was struck by the frequent use of the expression, "Well, that is a good thing from one point of view, but see how it works," and so on. Five years ago such an expression was almost never heard. The workmen saw nothing in the employer's policies except discrimination, oppression and grinding. The employers saw in the unions only senseless trouble-making, restriction of output, insubordination and destruction of the industry. The employers could not see a question from the standpoint of equality, and the workmen could not see it from the standpoint of efficiency. Already this blindness has gone. The former condition of frequent unorganized strikes has given way to organized freedom from strikes. The employers meet the union committees or agents even on the pettiest grievances, and a large amount of time is taken in these conferences. So far has each side advanced that some of the workmen were able to make the sweeping statement that all of their troubles in the past had been due solely to misunderstanding.

In the sense that each misunderstood the other's point of view this statement is true, but to understand is not always to be convinced. Each side continues as strongly as ever to stand out for its interests and keeps itself in readiness to strike or lockout. Doubtless this equal power to inflict damage has much to do with the willingness to see the other side. But it would be invidious and suicidal to say so when both are so diligently trying to be fair. Coercion works smoothly when not mentioned. Its greatest service is in predisposing the parties to take enough time to get the other point of view. When that is accomplished the adjustment is sooner or later worked out.

This is true even of those abstract rights and "principles" which each side considers fundamental, but which are utterly antagonistic. At the present time discussion happens to be centered on the "open shop" *vs.* the "closed shop," and there could apparently be no opposing principles less capable of compromise. But it is significant that in those industries where employers and unionists have learned to take the "other point of view," these so-called principles have disappeared, or, rather, human ingenuity has gotten around them without sacrificing them. The parties are so busy settling grievances as they arise, where the personal element is uppermost, that they concede to each other its own sacred realm of abstract ethics. If, however, they cannot settle their grievances then they appeal to the public on the ground of the violation of the moral law, and so the public hears the discussion only in the field where it is irreconcilable. When this public dis-

cussion, which places both sides in a false position, has had its run, it will be discovered that in the great majority of unionized industries, with but slight interruption, employers and workmen have already learned to adjust their principles to the other side's point of view.

The Appointment of Mr. Byrne

Of course, it was with the knowledge and consent, if not at the suggestion, of the President that Mr. William Michael Byrne, recently of Delaware, was appointed Assistant United States District Attorney at New York. We cannot understand why the suggestion was made or the consent given. This is the Mr. Byrne who resigned the office of District Attorney in Delaware in order that he might run for Congress in the Addicks interest to defeat the regular Republican candidate, Dr. Ball, who had the support of the Republicans whom Addicks could not control. Having accomplished the purpose of Addicks and caused the election of a Democrat, Mr. Byrne sought to regain the office which he had resigned. Mr. Roosevelt sent his appointment to the Senate, where the Judiciary Committee rejected it by a vote of 7 to 5. Some months later he was appointed again, and again (as in the first instance) the opposition was led by Senator Hoar, the result being an adverse report. Since this second defeat, Mr. Byrne has become a resident of New York. He does not deserve to hold a Federal office. His appointment in this city is a political blunder, in a State where the Republican party cannot afford to be responsible for such acts. The party invited sharp criticism by its prompt acceptance of the Addicks delegates from Delaware at the Chicago convention and its rejection of the delegates sent by those Delaware Republicans who have stedfastly fought against Addicks and all his works. At the same time it accepted the Spooner delegates from Wisconsin, rejecting those chosen by the regular La Follette convention, and making no effort to harmonize the two Wisconsin factions. It is admitted that this controversy in Wisconsin makes the State a doubtful one. Independent voters are not attracted to the Republican ticket when aid and comfort are given by the party to Addicks and his agents, whether it be in the national convention or in a New York Federal office.

Pan-Presbyterianism

Because such a meeting as that of the Pan-Presbyterian Council, just held in Liverpool, does no business and decides nothing, it does not follow that it does no good. It is a noble expression of the essential oneness of the Churches of the Reformed name the world over, and an influence to their consolidation. They count over five million communicants and 32,000 congregations and four million Sunday school scholars. The most interesting discussions had to do with questions of biblical criticism, and liberal views had their full share of presentation. It is pleasant to know that no speaker was heard with greater delight than Prof. Henry Van Dyke, of Princeton, whose assigned subject was "Christianity and Current Literature." We wish we could quote from it at length; but we must mention his illustration of an old woodman in the Adirondack forest who used to say that he wanted to go up to the top of a certain mountain as often as his legs would carry him, because it gave him such a feeling of "heaven up-histedness"—and it is hard not to quote his record of the Christian lessons which the greatest authors of Europe and America have given us:

"I read in Shakespeare the majesty of the moral law; in Victor Hugo the sacredness of childhood; in Goethe the glory of renunciation; in Wordsworth the joy of humility; in Tennyson the triumph of immortal love; in Browning the courage of faith in God; in Thackeray the ugliness of hyporcrisy and the beauty of forgiveness; in George Eliot the supremacy of duty; in Dickens the divinity of kindness, and in Ruskin the dignity of service. Irving teaches me the lesson of simple-hearted cheerfulness; Hawthorne shows me the hatefulness of sin and the power of penitence; Longfellow gives me the soft music of tranquil hope and earnest endeavor; Lowell makes me feel that we must give ourselves to our fellow men if we would bless them; and Whittier sings to me of human brotherhood and Divine Fatherhood. Are not these Christian lessons?"

Church Needs of Paris

As far back as 1845 a commission, the joint outcome of the then Archbishop of Paris and the Prefect of the Seine, determined that the outside limit in point of numbers of the parishes in Paris should be 30,000. The results were trivial, for in more than thirty years not a single parish church has been built in the French capital, which meanwhile has grown enormously. At the present moment the parish of Our Lady of Clignancourt numbers 105,000 souls. It is larger than the diocese of Tarentaise with its 60,000 subjects, and almost the size of the Catholic population of the diocese of Mende, viz., 110,000. Altho larger than Rouen, with its round hundred thousand, yet it has only one parish church and two chapels-of-ease, while the city in which the Maid of Orleans was burned at the stake has ten parish churches. In Vienna there exists the same lack of parish churches. Its municipal authorities have just fixed on 30,000 as the maximum number for a parish, and they have ordered the building of twelve parish churches in the capital of Austria. These statements we find in the official French Catholic organ, *La Semaine Religieuse,* April 2d, 1904, which sticks not at calling Paris "the most abandoned diocese of France from the religious standpoint." One would fancy that Cardinal Richard might mend his own fences and not worry over the few stray pickets missed from the home of Loisy at Bellevue.

While the "Slocum" disaster and the inadequacy of the official inspection of steamboats at the port of New York still excite public comment, the testimony of Admiral Melville and others as to the influence that has prevented remedial legislation should not be overlooked. The passage of carefully prepared bills, designed to cause surely a strict and sufficient inspection of safeguards on passenger steamships, including those engaged in ocean traffic, was blocked, they say, by the "shipping interests." Are these shipping interests, so hostile to Congressional legislation for the safety of passengers, the same shipping interests that have so persistently asked Congress for subsidies?

One lesson to be learned from the proceedings against those who assaulted Mrs. Biddle, in New Jersey, is that there should be new legislation, imposing a heavier penalty for such a crime. It appears that one of these three scoundrels had been imprisoned for a short term for a similar assault upon a young woman. The negro who was burned at Wilmington for rape had been convicted of a similar crime some years earlier, but had been punished by only a short term in a New Jersey prison. The penalty for such an offense as was committed at Mt. Holly should be nothing less than imprisonment for life.

Those who admire the courage shown by Judge Parker in sending that telegram to Mr. Sheehan should not forget the courage exhibited by Mr. Bryan four years ago. At Kansas City the Platform Committee was divided upon the question whether the currency issue should be ignored. Mr. Bryan sent word that if it should be ignored, he must not be considered as a candidate for the nomination. This he did before the platform was adopted and, of course, before any nomination had been made.

It is not so many years since no Nonconformist could be admitted to Oxford or Cambridge University, and some people seem still to think that English scholarship is confined to the Church of England. The highest honor at Cambridge is that of Senior Wrangler, and from 1860 to 1904 there have been 25 Nonconformists who have gained the coveted honor, leaving 20 for Anglicans, Catholics and Agnostics combined.

It is a question that admits of discussion whether the ecclesiastical administration of the Catholic Church is as wise as Protestants usually think it. For example, it has in this country 75 theological seminaries, where a dozen would be better by far. It has 197 so-called colleges for boys and 646 colleges for girls, nearly all of which are mere academies under a deceptive name. Most of the 7 universities have a better claim to their name.

Financial

Judge Bradford's Decision

After the defeat of the Harriman or Union Pacific interests in Minnesota, last April, they renewed in New Jersey their protests against the plan proposed by Mr. Hill and his associates for a distribution of the assets of the Northern Securities Company, these assets being Northern Pacific and Great Northern stock, which carries control of the Burlington railway system. The decision of Judge Bradford in New Jersey, announced last week, is a victory for the Harriman interests, so far as it goes; but it does not touch the merits of the main contention. It only grants a preliminary injunction restraining the Hill interests and the Northern Securities Company from distributing the assets according to their plan. This restraint is imposed in order that the distribution shall not take place until a decision as to the fairness and legality of the proposed plan shall have been reached in the courts. In all probability, this final decision will be made by the Supreme Court at Washington, for the contending parties are inclined to carry the question to the court of last resort.

The control of great railway systems depends upon the final settlement of this controversy. To the Northern Securities Company the Harriman (Union Pacific-Southern Pacific) interests contributed about $78,000,000 of Northern Pacific stock. They demand that the same stock shall be returned to them; but the Hill interests propose to return Great Northern as well as Northern Pacific shares, requiring the Harriman interests to take about three-sevenths of the total in Great Northern. Thus the Harriman interests would lose control of the Northern Pacific, control which they bought and which is represented by the $78,000,000 of stock contributed. As control of the Northern Pacific would not only deprive the Hill interests of one of their two roads to the Pacific, but also would carry a moiety of the joint control of the Burlington system, the stake is worth fighting for. If the Harriman interests should be victorious, Union Pacific, Southern Pacific, Northern Pacific and, probably, Burlington would be in their possession. If the Union Pacific, however, or one of its subsidiary companies should admit the ownership of a majority of the stock of the Northern Pacific, a parallel and competing transcontinental line, there might be a demand for the enforcement against it of the law that was used in the Northern Securities suit.

The Year's Foreign Commerce

An official statement of our foreign commerce in the fiscal year ending on June 30th, completed at Washington last week, shows that the sum of exports and imports, $2,451,574,623, was larger than ever before, that the exports of manufactures surpassed those of any previous year, and that the exports of domestic products exceeded those of any other country. The figures are as follows:

	Exports.	Imports.
1904	$1,460,829,539	$990,745,084
1903	1,420,141,679	1,025,719,237

Exports were larger than in any other year except 1901; imports exceeded those of any previous year except 1903. Exports of manufactures (the returns are not yet complete) in eleven months exceeded by $17,000,000 those of the corresponding months of the record year, 1900. The excess of exports over imports was $470,084,455, against $394,422,442 in 1903. It was in 1901 that the largest excess was shown, $664,592,000, the imports then having been only $823,000,000. The value of goods imported free of duty last year was $453,823,136; those on which duties were paid were valued at $536,921,948. Exports of breadstuffs showed a decline of $70,000,000, but this was more than made good by increases of $54,500,000 in cotton, $11,500,000 in mineral oils, and $12,500,000 in cattle, hogs and sheep.

Philadelphia has sold $16,000,000 of thirty-year 3½ per cent. municipal bonds at 101.036, the bid of a syndicate led by J. & W. Seligman & Co., of New York.

....Dividends announced:

Atch., Top. & Santa Fé R'way (Serial Debenture), Coupon No 5, payable August 1st.

Louisville & Nashville R.R., 2½ per cent., payable August 10th.

Phenix Ins Co., 5 per cent., payable on demand.

Insurance

The Withdrawal of the Mutual Life Insurance from Germany

The following letter written by President McCurdy, of the Mutual Life Insurance Company, just made public, is noteworthy, first, because of the explanation it gives of the company's withdrawal from Germany. It is important likewise because of the laying down in it of certain principles that are very broad in their application to present day problems in many fields:

NEW YORK, May 27, 1904.

EMORY MCCLINTOCK, ESQ., Actuary.

DEAR SIR.—I acknowledge receipt of your letter of the 23d inst., inclosing a translation of a letter addressed to you by Dr. Gruner, president of the German Imperial Supervising Office for Private Insurance, dated April 8th last.

Leaving aside the discussion of technical questions, I come to the consideration of the important principle involved in this proposition. Briefly, this is the surrender of the privileges, duties and powers of the Board of Trustees of this company to the Imperial Supervising Office. The acceptance of the terms of Dr. Gruner's letter would imply concurrence by me in the opinion, evidently held by the supervising office, that the Trustees of this company, acting in accordance with the authority and powers conferred upon them by the company's charter, are either incompetent or unworthy of managing its affairs.

Since the company was originally expelled from Prussia, in 1895, the principle involved has been practically the same as it is to-day, and it is against this principle that the Mutual Life has persistently and constantly contended. To agree to make the management of the company subservient to any governmental regulations which now exist or may at any time hereafter be imposed by the German Empire, or subservient to the will or political aims of the Imperial Chancellor, without the right of recourse to any court of law, and under penalty of expulsion and the confiscation of business established, would be beyond the legal authority of the present Board of Trustees, and, if attempted, would be a departure from principles which are national, and are as old as the foundation of this country as an independent Republic. The charter of this company is analogous, in its fundamental principle, to the Constitution of the United States and of the constituent States. This principle recognizes the right of individuals or corporations to manage their own affairs to suit themselves, provided the laws necessary for the conservation of society are not infringed. It is this basic principle which has fostered and stimulated the industries of this country; it is this independent, responsible direction of corporate affairs which has placed this country, in many branches of commerce and industry, ahead of any other country in the world, and it is this independence of direction, involving a corresponding sense of moral as well as legal responsibility, which has made the Mutual Life Insurance Company the largest, and probably the most successful, corporation of its kind in any civilized country.

In the business of life insurance, which is fiduciary in its character, it is universally recognized that the greatest publicity should be given to the condition of the company and to the actions of its Trustees and officers, in order that the public may have a clear insight into the affairs of the corporation; but so long as such public statements show the solvency of the institution and the honesty of its management the action of the Board of Trustees, which is the freely elected representative of the policyholders at large, is independent and cannot be questioned.

During our negotiations with Prussia, and subsequently with the German Empire under a new insurance regulation, the company has endeavored in every way to meet the requirements of the Government. Inquiries into methods and practices have from time to time been multiplied and expanded; to these inquiries the fullest possible answers and explanations have been made. That stage of the negotiations seems now to have been passed, and we are confronted as *sine qua non* for admission to the Empire with the demand that the management of the company shall be practically turned over to the authorities of the German Empire. This we respectfully and positively decline to do.

I should be glad if you will communicate this decision to Dr. Gruner by the hands of our Director General for Germany, Baron von Gablenz, who will make him a formal statement to the same effect. Yours very truly,

RICHARD A. MCCURDY, President.

Insurance Statement

THE HOME INSURANCE COMPANY, NEW YORK.

The one hundred and second semiannual statement of the Home Insurance Company, of which Elbridge G. Snow is President, has just been made public. The total assets, July 1, 1904, amount to $17,437,140. The cash capital is $3,000,000. The reserves for premium fund. unpaid losses, taxes, reinsurance and all other claims amount to $8,419,332, leaving a net surplus of $6,017,807, or a surplus as regards policy holders of $9,017,807. A semiannual dividend of 7 per cent. has been declared.

The Independent

Vol. LVII NEW YORK, THURSDAY, JULY 28, 1904 No. 2904

Survey of the World

The Field of National Politics

Ex-Senator Davis, the Democratic candidate for Vice-President, attended a conference of prominent Democrats in New York last week, and on the 20th went up to Esopus, where he talked with Judge Parker, whom he had never seen. For a man of his age (nearly 82 years) Mr. Davis exhibited unexpected vigor. It was decided that each of the two candidates should receive formal notice of his nomination at his home. The convention's committee will perform its duty at Esopus on August 10th and will call upon Mr. Davis some days later. Those who attended the New York conference were Senator Bailey, Senator Gorman, Messrs. Belmont, Ryan, McCarren, Sheehan, Guffey, Meyer, McLean, Kern, Edward Murphy, Jr., and two or three others. Charles F. Murphy, the Tammany leader, was in Michigan, but was represented by Victor J. Dowling. He has been invited by Judge Parker to call upon him at Esopus. The visitors at the Judge's home had not, up to the end of the week, been fully satisfactory to a prominent Gold Democratic newspaper in New York, which editorially expressed a hope that he would soon seek the counsels of a "quite different class," and that it would soon hear of the presence at Rosemount of such men as Judge Gray, Mr. Olney, John G. Carlisle, Judge Harmon and Edward M. Shepard. Ex-Senator Hill, whose home is in the neighboring city of Albany, had not been seen at Rosemount. Some explained his absence by a story about the Judge's memorable telegram to Mr. Sheehan. This story, the substance of which has not been attacked, is that Mr. Hill urged Mr. Sheehan to suppress the telegram and thus "to save Judge Parker from the consequences of his hasty act." Senator Daniel, chairman of the Platform Committee at the recent convention, in the course of a signed statement, correcting certain published accounts of what took place, says:

"A minority report would have been made in favor of recognizing the gold standard as settled, but for the fact that it would have produced, as members of the committee (Mr. Bryan and others) declared, other minority reports from them on a number of questions, and great confusion would have resulted. So it was agreed that no minority reports be made."

He also says that after the reception of Judge Parker's telegram it was his purpose to move that the rejected gold plank be added to the platform:

"Mr. Sheehan came to me immediately, and at once I took the gold plank of the subcommittee in hand, went to the stand, took my seat by the chairman, and was about to take the floor to offer it as an independent resolution. At this juncture a member of the committee, others concurring, came to me and suggested that as I represented a compromise report I should offer no other resolution. I replied that I might differ with him, as the platform matter was ended and an exigent situation was presented, but I would not debate the question of propriety, and yielded to this opinion."

Senator Culberson says that at no time was it possible to have a gold plank, and that if one had been adopted, the Southern and Western delegates instructed for Parker would have regarded this action as a release from the obligation thus imposed.—Judge Parker, Mr. Davis and many others

urged Senator Gorman to take charge of the campaign, as chairman of the national committee, but he positively declined. Mr. Sheehan also refused to take the place. At the end of the week it was expected that the chairman would be Mr. Thomas Taggart, member of the committee from Indiana. Mr. August Belmont said he had not been a candidate for the office, and could not take it if it should be offered to him. Judge Parker will probably leave the bench before August 8th, in order that his successor may be chosen at the November election.

Opinions and Political Changes

Mr. Cleveland, in a published article, sees the party entering the campaign with "hope and confidence." As an organization, he says, it has been "freed from the financial delusions that have made it weak." This is "too apparent for denial." No action of the late convention "can be construed," he asserts, "in any other way than as an acknowledgment of the establishment of the gold standard, and a willing pledge to its maintenance." "Of course," he continues, "it would have been a matter of great satisfaction if we could have had a declaration in the platform committing our party in distinct terms to the acceptance and constant defense of the gold standard—not because of an unexpected increase in gold production, but on grounds of economic wisdom and national honor." Still, "such a platform assurance was not necessary either on sentimental grounds or to make gold standard conditions more certain." He warmly praises Judge Parker for "filling the blank in a disabled platform." No man, he says, "ever did so much for the cause, in so many directions and in so short a time."—On the other hand, Mr. Oscar S. Straus, Minister to Turkey in Mr. Cleveland's first administration, and later the successor of ex-President Harrison as a member of the Permanent Court of Arbitration at The Hague, has gone over to the Republican party, saying that "a party which cannot unite, or has not the wisdom or the courage to unite, in putting a sound-money plank in its platform is not sufficiently reconstructed to be intrusted with power." In a letter to President Roosevelt, dedicating his best service to the latter's election, Mr. Straus says that he has always been a Democrat, "latterly a Cleveland Democrat." In a public statement he points to the President's action with respect to the coal strike, the Miller case, the Venezuela controversy, the open door in China, and the massacre of Christians in Turkey, saying that "the moral leadership of his Administration has made itself felt throughout the world."—Mr. Carl Schurz has sent to Judge Parker a letter, saying:

> "The principles and opinions you are known to hold as to the currency, imperialism, the tariff and the civil service strongly commend themselves to men of my way of thinking. But if, as an independent, I ever was doubting for what candidate my duty commanded me to vote, your action on the terms of your nomination has completely solved that doubt."

This action, he continues, demolished the last pretext for still treating the gold question as a live issue, and set up a noble standard of moral courage and civic virtue.—Ex-Senator Pettigrew, who was chairman of the South Dakota delegation at St. Louis, virtually bolts the nomination of Parker in a public statement, saying that Bryan is "the grandest figure in American political life," and that "a political party that would discard his leadership for the leadership of Belmont and Hill and the former slaveholders of the South certainly has not exercised that judgment and conscience which forebode success."—Judge Robert Hunter, a prominent Republican of Louisiana, has gone over to Parker because, he says, Roosevelt has forced the negro issue into the campaign.—Mr. William Rockefeller, of the Standard Oil Company, has declined to be a member of the Campaign Committee of the Union League Club, in New York. The press regards this as evidence of his opposition to the Republican ticket.

A Platform Suggested by Mr. Bryan

Mr. Bryan says he is now "free to undertake the work of organizing the radical and progressive element in the Democratic party." Therefore he publishes an outline of the new doctrines he would like to "engraft upon the party creed." The

money question, he remarks at the beginning, "is for the present in abeyance; while bimetallism is as sound in theory as ever, the necessity for it is now not so apparent." He believes that "the time will come when the people will again turn to bimetallism and reject the gold standard, but this period will not come while times are good." He invites Democrats to consider a plan for the Government ownership and operation of the railroads. "Consolidation after consolidation has taken place, until a few men now control the railroad traffic of the country, and defy both the legislative and the executive power of the nation." Purchase of the roads by the Federal Government seems to him more objectionable than ownership and operation by the States, because it would mean "an enormous centralization of power." "The several States can own and operate the railroads within their borders just as effectively as it can be done by the Federal Government, and if it is done by the States the objection based upon the fear of centralization is entirely answered." He would have a board of representatives from the several States to deal with "the joint traffic." In cities, the party should espouse the cause of municipal ownership of municipal franchises. The Post Office Department should "embrace a telegraph system." A progressive Democratic party must stand for an income tax and a tariff for revenue only, he says, and without an income tax it will be difficult to secure effective tariff reform. The income tax plank was omitted this year "because the men in control of the party thought it would jeopardize success in the Eastern States." But this objection cannot have weight "when the party goes forth, as it must ultimately, to appeal to the masses." The party should stand not only for the election of Senators by the people, but "for direct legislation so far as the principle can be conveniently applied." It should consider whether Federal judges ought not to be elected by the people for limited terms. It should be the champion of the laboring man, striving to protect his rights and interests. The contest thus outlined, Mr. Bryan says, must be made, whether the party wins in November or not. "If Mr. Parker is elected, his administration will rid us of imperialism and of the threat of a race issue, and give us greater freedom in the taking up of economic questions." It is evident, Mr. Bryan remarks, "that the conservative Democrats, as they call themselves, will never give the country any relief from the Trusts."

Mr. Folk for Governor

Joseph W. Folk, the famous prosecuting attorney of St. Louis, was nominated for Governor of Missouri at the end of an all-night session of the Democratic State convention on the 21st inst. Throughout the canvass he had been opposed by the party machine, which appears to have been in sympathy with the "boodlers" he has been prosecuting; but his friends controlled the convention. There were two other candidates, Police Commissioner Hawes, of St. Louis, and Mayor Reed, of Kansas City, but before the roll-call was finished, on the first ballot, Mr. Hawes moved that Folk be nominated by unanimous vote, and then the head of the ticket was quickly chosen. Mr. Folk and his friends were satisfied with the platform and all of his associates on the ticket, except Samuel B. Cook, for Secretary of State, and Albert O. Allen, for Auditor, both renominated. It is said that these represent the machine. They were successful because many of the delegates, including some who stood for Folk, had been instructed to vote for them. Hawes brought 111 delegates from St. Louis. Nearly all of these the Credentials Committee (controlled by friends of Folk) accepted, altho there was much evidence that the election of them had been marked by fraud and intimidation. The evidence, however, did not prove that they would not have been chosen without such assistance. It was known that Cook had witnessed the payment of a bribe to a State Senator, and a resolution asking him to withdraw was introduced and referred to a committee. He was nominated on the first ballot. If elected, Cook and Allen will be two of the five members of the Board of Equalization. Accepting the nomination Mr. Folk made a forcible speech. He had been fighting corruptionists with all the powers at his command, he said; he had no favors to ask of them and no quarter to give. The battle against boodle in

Missouri had only commenced; if he should be elected he proposed to make the State the most unhealthy place in all the land for corruptionists to operate in. So long as God should give him life and strength he would combat the things that dishonor and oppress. The platform declares that the paramount issue in Missouri is the eradication of bribery from public life. It promises unremitting warfare against corruption, and pledges the party "to hit corruption and hit it hard, whether in our own ranks or in the opposition party." It calls for laws making null and void all franchises obtained by bribery, extending to five years the term of the Statute of Limitations, and making professional lobbying in the Legislature a felony. Returning to St. Louis on the 22d, Mr. Folk at once resumed the work of prosecution, and before night two more "boodlers" had been sentenced.

The Beef Workers' Strike Renewed

An agreement was reached by the beef companies and their employees, on the night of the 20th, providing that the men on strike should resume work, pending arbitration; but the strike was renewed on the 22d, immediately after the strikers had presented themselves at the packing houses, at the hour set for their return. They assert that the agreement was violated by the packing companies. It provided that the "wages and working conditions of all employees now on strike" (unskilled laborers, of course, included) should be submitted to arbitrators, before whom any grievance might be brought:

"The packing companies to retain all employees now at work who wish to remain, and will re-employ all employees now out as fast as possible, without discrimination. Any former employee not re-employed within 45 days from the date work is resumed to have the privilege of submitting his or her case to arbitration, on the question of discrimination."

On the afternoon of the 21st the packers offended the strikers by issuing a circular pointing out that they had reserved the privilege of retaining all the non-union men who had been hired, and adding the following words:

"The privilege of arbitration within the time limit of 45 days covers the question of 'discrimination' only, and is in no way intended to guarantee to the striking employees that they will be taken back and given the places now filled by non union help."

The strikers said this was not a fair construction of the agreement. When they appeared at the packing houses on the 22d they were told that not more than half of them could be employed. Their officers assert that there was gross discrimination, that good workmen known to be union leaders were rejected, that others were selected here and there without regard to priority of application, that many were told that they might never be taken back and that the Armour Company's superintendent said to them: "You went out like cattle; we'll take you back like cattle." By order of President Donnelly, the strike was at once renewed. Then, at a fruitless conference, the unions declined to permit another attempt to enforce the agreement. The packers, in a signed statement, denied that discrimination had been practiced, or that the agreement had been violated by them "in any particular." In another signed statement, the unions said that violations of the agreement had been admitted by the packers. The union men of the allied trades—firemen, engineers, blacksmiths, coopers, teamsters, etc., 14,000 in all—who had not yet gone out in sympathy, sent to the packers an ultimatum. Declaring that the agreement, having been violated, was null and void, they demanded that "all" the butchers be taken back within 48 hours, and "all" the other employees within 10 days. This had no effect, and on Monday morning the original strikers were joined by 10,000 of these men. There were negotiations for another conference, but at last accounts the packers were scouring the country for non-union men and were erecting stockades to protect them.—The cotton manufacturers at Fall River having ordered a wage reduction of 12½ per cent. for the 25th, their employees decided to strike. On that date very few of the 25,000 workers affected went to the mills, which may be closed for an indefinite time. A reduction of 10 per cent. was made in November last.—The question of the "open shop" has

been raised by bricklayers employed upon the new War College buildings at Washington. A non-union man who happened to be a negro was added to the force, his name coming from the Civil Service eligible list. The 28 white union bricklayers demanded his discharge, saying their rules forbade them to work with a non-union man. Captain Sewell, of the Engineers, the officer in charge, replied that they had better change their rules, as it would be easier to change them than to change the Constitution of the United States. Whereupon they quit work. The negro was retained, and five additional bricklayers have since been employed.

The Wreck of the "Maine"

Some weeks ago, R. H. F. Sewell, of New Orleans, informed the Navy Department that he had entered into a contract with the Cuban Government to float the wreck of the battle ship "Maine." He asked whether our Government had any claims upon the property. The Acting Secretary of the Navy, Mr. Darling, replying on the 18th inst., said that altho the Department did "not contemplate undertaking any work upon the wreck," it could not with propriety "give a letter or other paper which would be in the nature of credentials to be presented to the Cuban Government." Nor did any Executive Department, Mr. Darling continued, "have the power on behalf of the United States, to abandon the wreck of a public vessel:"

> "The disposition of the public property of the United States rests with Congress; and this Department would not undertake to give an acquittance or relinquishment of any rights of the United States in the wreck of the 'Maine' for the obvious reason that Congress might thereafter at any time, by enactment, direct that a different disposition thereof be made."

This action of the Department seems to prevent the raising of the wreck by Mr. Sewell or any other person who has sought to do the work under a contract with Cuba. Joseph De Wyckoff, of Havana, asserts that he agreed with the Cuban Government, on June 8th, to raise and remove the wreck within a year, and that he is to pay $5,000 for the privilege. He also says that he intends to begin work at once, and expects to make a considerable profit out of the material, as the ship represented an expenditure of $5,000,000. Altho Cuba desires to have this obstruction to navigation removed, it is said that she has never addressed our Government on the subject. The wreck has been lying in Havana harbor six years, virtually abandoned by the United States.—It is expected that Cuba will negotiate an additional loan of $10,000,000, half of which will be used in paying the soldiers of the revolution, while the remainder will be expended upon public works.

The Chamberlain Program

Notwithstanding the split in the Unionist Party, and the indications of successive by-elections that they will be in a hopeless minority in the next Parliament, Mr. Joseph Chamberlain and his supporters show courage in maintaining their Protectionist policy. The Tariff Commission, for whose report Mr. Chamberlain was waiting, has been published. It declares that in the iron and steel trade British production and exports have declined in comparison with other countries, altho they have increased in amount; but they have not maintained their relative position. The imports of the colonies are more and more from other countries. The increase in the value of cotton exports is due to the increase in prices, not in the quantities of goods. The cause of the relative decline is, it says, the practice of other countries that enjoy protection to dump surplus products, after a profit on home sales, on British markets. This is done especially by Germany and the United States. It is the British system of free imports which makes this practice of dumping possible. The commission, therefore, recommends that Great Britain shall adopt a system of tariffs of three grades. There shall first be a general tariff with a low scale of duties for foreign countries which admit British wares on fair terms. There should be a still lower preferential tariff for the colonies which give preference to British productions, with a view to free trade within the British Empire. There should be a third maximum tariff for countries that lay a corresponding tariff o British imports, but this would be subject to reduction by negotiation to the

level of the general tariff. Ten days before this report was published the Unionist members of the House of Commons entertained Mr. Chamberlain at a dinner at the Hotel Cecil. Out of 348 members 200 attended the dinner or were necessarily detained, leaving 148 who were not in sympathy. Mr. Chamberlain made a very patriotic speech, in which he hardly spoke of the kind of protection that he desired, but dwelt eloquently on the importance of consolidating the Empire while it could be done. He insisted that the day of small nations was past, that nations could become great and strong only by following the example of the United States in forming a single nation out of separate colonies, of Italy in uniting its separate divisions under one Government, and of Germany in creating one Empire out of dissevered kingdoms and duchies. He tells how he was converted to protection while urging against it, and he concludes:

"We must throw aside the pedantry of the schools; we must be prepared to make concessions, aye, we must be prepared to make sacrifices if sacrifices be called for; and we must seize this opportunity to take the first step toward the erection of that great edifice which we hope will endure in the ages to come, and carry to distant posterity the glory of the British name."

The Royal Declaration Against "Popery"

The effort to secure a modification of the Royal Declaration required of the King of England on his accession to the throne has again proved abortive. The form of this Declaration is very offensive to Roman Catholics. It requires the King to denounce the doctrine of the Mass, as well as to promise to "maintain" the established religion of the country, whether in England or in Scotland. The question of changing the Declaration came up three years ago after the succession of King Edward, and a committee of the House of Lords was appointed to devise a new form which should not be offensive to Catholics. Then Lord Salisbury suggested that it would be well for the Catholic Peers to stand aside and trust to the good feeling of their Protestant associates. But the effort was an entire failure. The committee appointed consisted wholly of Protestants, and, without consulting the Catholic Peers, they brought in a report in which these words were put into the Royal mouth:

"And I do believe that the invocation or adoration of the Virgin Mary, or any other saint, and the Sacrifice of the Mass, as they are now used in the Church of Rome, are contrary to the Protestant religion."

This was laughed at by the Catholics, who declared that they also repudiated the "adoration" of the Virgin Mary, and that the rest of this Declaration could be taken by the Pope. So the attempt was then a failure. Now the Catholic Peers have lost patience, and have again brought up the subject. The Duke of Norfolk was quite willing that, in view of the public feeling, the King should be denied liberty of conscience and should be held to the acceptance of the Protestant faith, but he would consent to no condemnation of the Catholic faith. The King might "maintain" the Church of England, and also the Church of Scotland, but he must not denounce the doctrines held by twelve million of his subjects. The Duke of Norfolk's resolution in the House of Lords led to a long debate. Every one disclaimed any desire to insult the Catholic faith, while feeling it necessary to maintain the Protestant succession. The Earl of Jersey offered an amendment, which ran thus:

"That this House, while desirous that no expression unnecessarily offensive to any of his subjects should be required of the sovereign on his accession to the throne, is of opinion that nothing should be done to weaken the security of the Protestant succession."

This was accepted, as the principle to be followed, and it was then moved to appoint a committee to see whether any unnecessarily offensive words might not be expunged. This was immediately put to a vote, and negatived by 103 to 36 votes, thus showing, as the present Marquis of Salisbury said, both their sense of the importance of the subject and their incapacity to deal with it.

The Russian Bluff

The week has been an exciting one in diplomatic and financial circles owing to the seizures of merchant vessels by Russian cruisers in the Red Sea. It will be remembered that two ships of the Russian Volunteer Fleet, the "St. Peters-

burg" and the "Smolensk," were, after some parleying, allowed by the Turkish Government to pass through the Dardanelles from the Black Sea, as merchant vessels, and that they passed through the Suez Canal and then assumed the status of war vessels. The Vounteer Fleet was organized some ten years ago. Ships were built by the public subscription of various provinces and named after them, designed to be used in commercial business during peace, but to become cruisers in time of war. By a treaty to which all Europe is party the Russian ships of war in the Black Sea cannot pass out into the Mediterranean, and equally no war ships can enter the Black Sea from the west. So as merchant ships the "St. Petersburg" and the "Smolensk" escaped from the Black Sea, all armed and officered, but with some transparent concealment of their character. As soon as they reached the Red Sea they began their work as regularly commissioned vessels of war, and began searching and seizing vessels suspected of carrying war material to Japan. First the British steamer "Malacca" was seized, sailing from Antwerp to China, and then the German vessel "Prinz Heinrich" was detained and her masts taken. Other seizures followed, but these were enough to startle the rulers and excite the public mind in England, Germany and France. It was shrewdly suspected that this was the execution of a deep purpose to embroil Russia with Great Britain and other Powers, so that Russia, seeing her weakness, might yield to the voice of the world and cease the war, rather than be seen to be beaten by despised Japan. But it would seem that the commissioning of these transformed merchant vessels to act as cruisers and seize cargoes for Japan was not the act of the Department of State presided over by Lamsdorff, but of the Ministry of Marine and the clique of Grand Dukes related to it, and who are responsible for the present war. It does not seem to have occurred to them that there could be any question of the right of a vessel to be a merchant ship to-day, for the purpose of passing the Turkish forts and outwitting the treaty, and a war vessel the next day, without having meantime visited a Russian port. But immediately the question was raised in Parliament and in the public press everywhere whether this was allowed by the laws of nations and by the treaty, and the answer was, except in Russia, in the negative. Further, under the present international rule ships carrying a neutral flag are safe from seizure, altho they may be stopped and searched if there is reason to believe that they are carrying war material for the enemy. In the case of the "Malacca" war material was being carried, but it was not for Japan, but for the British forces in China, as was evident by the mark of the broad arrow on the cases, which perhaps the Russian officers did not understand. Equally, under the existing laws of nations the Russians had no right to seize the Japanese mails, and, indeed, they restored them by a later vessel, which they detained, only holding the letters from a German company that manufactures arms.

The Russian Diplomatic Retreat

The end of the Russian bluff came when the "Malacca" was taken back through the Suez Canal, to be brought as a prize before a Russian prize court. Feeling in Great Britain was at a white heat. Orders were sent to the British vessels in Maltese harbors and elsewhere to proceed to Egypt, and one or two were sent through the Canal to the Red Sea to prevent further seizures. There was serious danger of war if Russia did not back down. Germany was showing less anger, and France could not approve. So Russia yielded and agreed that no further seizures should be made, and that the "Malacca," which had hastened out to sea before the arrival of the British vessels, which very likely had orders to seize her by force, should be taken to an Algerian port, and, after a formal examination in the presence of the Russian and British Consuls, should be released. Orders were sent to the raiding cruisers to make no more seizures, and, on this being known, the excitement was allayed, altho several further seizures had meantime been reported, but declared by the Russian authorities to be due to the vessels at sea not having received the orders to desist. This, however, left open and undecided the question of the right of the Russian Government to take out its vessels of the Volunteer Fleet as merchant vessels and then transform

them at sea into vessels of war. It is now stated that this question has been forced upon the Russian Government by its unfortunate escapade in the Red Sea, and under pressure from Europe, Russia has completely backed down, and will not withdraw other of its fleet from the Black Sea. The act of the commander of the "Smolensk" in seizing the "Malacca" Count Lamsdorff attributes to "an excess of zeal," and makes an apology. The Czar is credited with the withdrawal from the untenable position assumed by his Minister of Marine in ordering the vessels on their cruise in the Red Sea.

Renewed War Activity

For several weeks there has been little to report from the seat of war, in part owing to the early coming of the rainy season, the first rains being followed by a short period of pleasant weather. But now, just as the settled rains were beginning, we have news of much activity the past week. The reports from Port Arthur are still much confused, and it is evident that the Japanese have made only slow approaches, but are preparing for a speedy attack in force. A Chinese report of 4,000 Japanese killed by a mine is not confirmed. But the approach of the northern wing of the Japanese army to Liaoyang gave much concern to General Kuropatkin, and he ordered an attack on General Kuroki's forces in the Fenchuling Mountains. The attack was made by General Keller, but failed to dislodge the Japanese, who, after two days' fighting, pursued the retreating Russians. The Russians acknowledge a loss of a thousand men. The main fight was for possession of the Motien Pass. The attack began under cover of a dense fog, and 20,000 Russians are said to have been engaged in it. The Japanese loss was much less than that of the Russians, and is said to have been about 200. But the Japanese activity in the north, threatening Liaoyang and the railroad between that city and Mukden, seems to have been intended to mask an attack in force on Tashichiao, Yingkau and Niuchwang. For some time the Japanese army has been only six miles from the southernmost strong Russian camp at Tashichiao, since the capture of Kaiping. They have been landing reinforcements near Yingkau, which is the port of Niuchwang. There has been sharp fighting only eight miles east of Tashichiao, with reports of heavy losses on both sides, but yet not a general engagement, unless one began on Saturday last, when the smoke of battle was clearly visible from Tashichiao, as also from the roofs of Niuchwang, which the Russians are deserting. It would seem to be the plan of the Japanese to gain possession of the coveted port of Yingkau, which would greatly reduce the difficulty of supplying any stores for their troops in their northern advance. The demonstration against Liaoyang would seem intended to withdraw northward a part of Kuropatkin's army.—During the week the Vladiovostok squadron has again been out to sea, steaming slowly, to save coal, and looking out for vessels bringing supplies for the Japanese from Europe or America. One vessel has been captured and sunk, and two others taken as prizes, English and German, and the Japanese have warned all merchant vessels to remain in port, but are much concerned for several large steamers that are nearly due from San Francisco and Portland.

Minor Items

Some anxiety is felt for the health of King Christian, of Denmark, who has been visiting the relatives of his grandson, Prince Christian, in Mecklenburg-Schwerin. His private physician, Professor Schou, has been summoned to see him. King Christian is 86 years old, and his children and grandchildren are connected with nearly all the royal families of Europe.—The success of the Harvard-Yale athletes in their contest with those of Oxford and Cambridge last Saturday was quite all they hoped for. They won six contests out of nine. They were beaten in the two-mile, mile and half-mile runs, while the Americans won the hundred-yard dash, the quarter-mile run, the high jump, the broad jump, the high hurdles, and throwing the hammer.—There are fresh reports of extensive massacres of Armenians in the region of Mûsh and Lake Van. Hundreds are said to have been assassinated.

The Meat Strike

BY ERNEST POOLE

[Our readers will remember the article we printed by Mr. Poole a short while ago concerning the rise of rents on the East Side of this city. At that time Mr. Poole was a resident of the University Settlement. He is now in Chicago and has taken up his residence in Packingtown so as thoroughly to investigate the strike at first hand. We expect to print in a subsequent issue the autoblography of a Lithuanian immigrant who has worked in the stock yards, and whose narrative will throw an interesting side light on the lives of the strikers.—EDITOR.]

IN the coal strike the union was able to hold out until it forced a national crisis; forced the American people, including their President, to think hard and fast, not alone of abstract unionism, but of certain concrete union demands; forced them to thoroughly investigate the facts, and to look up the records, both of the union and the Coal Trust.

The meat strike of 1904? Can the National Meat Workers' Union hold out long enough to create such a crisis as will again thoroughly arouse the people? In the first week of the strike the prices of meats all over the country have jumped 30 per cent. Already the people have been deeply stirred. Already they are demanding the facts—demanding that the union prove by facts whether its claims be just—and demanding of the Meat Trust that it show by facts the reasons for the enormous rise in meat prices that has come in the last four years. The attitude of the farmers toward the labor union may now be cleared as never before. Already both political parties, who evaded the labor issue in their Presidential conventions, are beginning to feel from every side a steadily increasing pressure forcing them to come out of the woods and into the open.

There is but one question for the public to consider here. This question is so deep and vital that it does not first appear. To reach it we must first see the more immediate cause of the strike.

Of the 60,000 men on strike 40,000 are engaged in different kinds of unskilled labor. Under the union's last annual agreement, these unskilled men received 18½ cents per hour. A few received 19 cents, many others 17½ cents, but the largest number, like the 15,000 in Chicago, received 18½ cents an hour. This wage is much lower than it first appears, for as the men average but forty hours' work a week throughout the year, 18½ cents per hour means only $7.40 a week. On May 28th, when this annual agreement expired, the union demanded that this 18½ cents be made the minimum wage in all cities. This the Trust has refused to do, and since May 28th they have in Chicago reduced nearly a thousand unskilled men to 16½ cents per hour, thus showing their future policy of wholesale reduction. Finally the union—having in vain protested against this reduction—broke off negotiations, and the whole 60,000 struck solely in the interest of the 40,000 unskilled laborers.

I examined first into this more immediate cause.

The union's point of view is easy to understand. A month ago I asked Michael Donnelly, the union's president, whether he would accept this threatened reduction of wage. He promptly answered "No. We cannot possibly accept it." "And yet John Mitchell has accepted a reduction for his union," I said. "The miners can do it," said Donnelly. "They had already forced up their wages high enough so that they could afford to accept a slight reduction, but how can you expect these unskilled men to do it—how can you expect a man with a family to accept a reduction from $7.40 a week?"

To find what kind of living such a wage could give I came a week ago to live here in "Packingtown." I came in across Bubbling Creek, a waterway thickly coated with grease and filth and

MICHAEL DONNELLY
The Strike Leader

garbage, with carbonic acid gas boiling up from the impure masses below. From the bridge here the main street stretches away into Packingtown. On this street, from the bridge I counted 27 saloons in one solid row. A few blocks to the left twenty tall slaughter house chimneys pour black smoke over the sky. To the right, one-half mile away, are the great tracks of the Pennsylvania Railroad. The tracks of the Grand Trunk cross one-half mile ahead. At midnight now I can hear the endless freight trains go rumbling shrieking by. No wonder the three babies across the yard have waked up and are screaming. From this district the skilled workers, having won higher wages, have moved out into better air. In here live the unskilled—the men on $7.40 a week. Many by strict frugality have kept their cottages fairly comfortable and wholesome. Others live in wretched basement rooms. A family of five in one room is not uncommon. The more recent Polish and Slavonian and Lithuanian immigrant men live often in boarding houses, where one small bedroom does for four boarders. On a night like this such rooms are stifling and noisome from the 20 chimneys and from Bubbling Creek. In winter—so the doctor here tells men—such rooms are even more unwholesome, for the thin board walls give scant protection from the keen zero blasts off Lake Michigan.

Such living is what comes from $7.40 a week. The demand that it may not be made worse is not exorbitant.

The Trust's point of view is equally easy to understand.

"Yes, it is hard," I heard yesterday from the superintendent of one large packing house. "It is hard that this wage must be reduced. But it can't be helped. It's simply the law of supply and demand. The supply of labor is steadily growing larger. Had you come here last week at 6 a.m. you would have seen over 5,000 men looking for jobs. As the depression grows worse there will be 100,000 men out of work in Chicago. They will crowd out here. They won't demand 18½ cents. They will be glad to get even 15 cents. Why should we pay more than we have to? We certainly have the right to hire labor as cheap as we can."

From a business standpoint this view is entirely right. Yesterday I gave it to one of the common laborers. "It ain't right!" he said at once. "I have worked six years for the packers. If they got half shut down by the depression then I would have to suffer, too. But they ain't shut down. They're doin' a big business. They're puttin' up prices higher every year. Now, what I want to know is, Ain't I a part of the show? If I am, why shouldn't I get my share of their prosperity? At any rate, why should I go down in wages, just because the packers see a chance to make still more money by squeezing me?"

Should men be treated as mere expense items or as fellow workers and fellow sharers with the employer? This is the immediate question for the public to consider here.

But beneath this question lies a far deeper issue. Why do the 20,000 skilled workers throughout the country strike for the 40,000 less fortunate laborers? Because in the fate of these 40,000 lies

the whole future life and power of the union. "All our leaders see this," said one of Donnelly's right hand men to me this morning. "We've seen it for years." So has the Trust. This strike is only the climax of a long slow development—a growth from the strictly non-union shop toward the union shop.

Four years ago in the yards the non-union shop prevailed. The packers, untroubled by the united demands of labor, disregarding individual demands of the men, very naturally made their own profits the supreme consideration.

"In those days," a former foreman told me, "if I could save one twenty-fifth of a cent on the expense of killing each beef I knew that I would be preferred over other foremen. I was constantly trying to cut down wages in every possible way by driving individual bargains with separate men. The other foremen were doing the same. Some of them got a commission on all expense they could save below a certain point."

In hours likewise, the men were not considered. The work rushed or fell off as the consignments of live stock came in. It was cheaper for the packers to kill their stock very soon after its arrival. One day the men worked eleven hours, the next day three hours, the next fourteen hours, the next none at all.

The men, forgotten by the packers, were constantly abused by the foremen. There can be no question of this fact. For this bitter memory has lived four years and is still heard on every side. One instance will illustrate hundreds of others. It was late afternoon on a stifling August day in the cattle killing room. The heat from the blood and the odors from the butchering were frightful. In the midst of the heat and turmoil an old Bohemian was feebly trying to keep up with the high pace at which the foreman was driving his men. The old man blundered. The foreman shouted some direction, but the old man could not understand it. Suddenly the foreman seized him with both hands by the collar and shook him like a rat. The next moment the foreman lay unconscious on the floor. The man who had struck him down was discharged the next day for insubordination.

This was the non-union shop, and the ideal shop from a purely business standpoint. But four years ago the union was formed in spite of strict precautions of the packers. The union grew. The packers felt its strength. Then slowly, without any general strike, wages were forced up over 25 per cent. for the skilled workers. Hours were made more regular, foremen's abuse was abolished.

Packingtown

But meanwhile, when the packers were forced to pay higher wages and to work more regular hours, often to a great disadvantage, they began the more swiftly to develop machinery and specialization of work. One month ago in a big packing house I was shown the effect of this change. Here I spent several hours going about with the superintendent. Even to my unpracticed eye it was plain that the entire industry was being swiftly transformed. Where one man had killed and dressed a hog, now the wretched beast traveled dangling from a long chain through room after room while over a hundred men did each one small part in the dressing and cutting and cleaning.

In other places I found the work even more simplified by subdivision or else done wholly by a machine, which only needed a man to feed it. "It is easier," said the superintendent, "for a lower class of mind to grasp this work. I'll go even further. The lower mind can do it better. We prefer these immigrants, because when once you have pounded it into their heads just what they are to do and they learn to do that *one* simple thing, then they will stand and do it as stupidly and reliably and steadily as a machine from morning until night." "Then," I asked, "do you mean to say that as machinery develops here the man bright enough to have other thoughts and feelings of his own is not so desirable as this stupid immigrant, whose mind is vacant while he works?" "Yes," he answered, "that is true."

That same morning at six o'clock I had gone through the yards and had seen some 5,000 men looking for work. Most of them were fresh immigrants, Lithuanians, Bohemians, Slavs and Poles. It is these people who are welcomed by the packers. It is a well known fact in two large packing houses immigrants are always the ones picked out from the morning crowd at the door. These unskilled stupid laborers would be willing, if necessary, to work for half the wage that American workmen require. It is easy then to see why the packers welcome them and why they are so developing their industry that these men, together with the increasing thousands of women, shall more and more take the place of the skilled workers, the men who use their own brains, the men who are intelligent enough to form a strong and formidable union. These more intelligent workmen, who have formed the backbone of the union, now see that unless this tendency can be checked the union will be swamped. When a ship has a great gap in its bottom that gap must be stopped or the water will rush in from below and the ship will sink. The union is trying here to stop this gap below. They know that unless they can enforce a minimum wage as a check to this steady lowering of the price of labor they will be forced to compete with millions of immigrants and with millions of women and young boys and girls, who are in increasing numbers being drawn into American factories. "Yes," said a union leader two days ago, when I spoke of this prospect, "we all see it coming. It is a tremendous problem, we know that, but all we want is that in settling this problem the good of the workers be considered as well as the good of the packers."

This sets the question for the public to consider. Shall an industry be developed for the profit of the employer alone, or shall the welfare of the workers be considered of equal or even greater importance?

The public too often thinks that one man can call a strike in an hour. It took six weeks and 60,000 men to call the meat strike. The successive steps were as follows:

On May 9th, at the National Convention of the union at Cincinnati, 200 delegates met from local unions all over the country and agreed upon the wage scale which is now demanded.

The Executive Board of eight men met with President Donnelly, discussed this scale, presented it to the packers, and discussed it with them many times during the next six weeks.

When this discussion failed on the question of the wage for unskilled labor, then the Executive Board put the question by referendum vote to every local union in Chicago, St. Louis, Omaha, Kansas City, New York, St. Paul, St. Joseph, Ft. Worth, and several other centers. The unions all unanimously decided to strike.

In some 25 packing centers through

the country delegates from the local unions met in central bodies and again discussed the question. These central bodies finally ordered the Executive Board to call a strike.

The Executive Board then discussed the most suitable time for striking.

Then, and not till then, did Michael Donnelly, the president, send the word rushing over the wires which started the great strike machine in motion.

Since the strike began I have been living next door to union headquarters, and have gone there frequently. It is a busy scene day and night. The long outer hall is crowded with an endless stream of all nationalities stopping before the rows of local union desks to pay their dues and get fresh union buttons. In the inner room you may find groups of leaders discussing the latest move or waiting for others. Every few minutes a door is dashed open from a still smaller room where three or four big leaders are constantly in conference. Some one from outside is called in. A telegram is sent in cipher, or the long distance telephone is used. Every hour brings fresh bulletins from other cities. Word comes demanding Donnelly's presence in St. Louis, and he goes there to speak on Sunday. Earlier in the week he was constantly going down town to confer with President Gompers, of the American Federation of Labor.

Meanwhile you hear the constant buzz outside of voices in the big outside room speaking in Polish, Lithuanian, Bohemian, Slavic. You look out the open windows at the hundreds crowding the street corners below. You go out and walk through the district and see 25,000 men of all nationalities idle in the streets; some sitting on their door steps with their wives and babies, others restless and out of temper from the stifling air of Packingtown, others excitedly discussing the strike. As you listen now to one and now another of the five different languages, as you pass through the different districts where different nationalities live, then Packingtown begins to seem like a little world in itself. You feel that here is a great mass of humanity, the kind that is hardest to manage, the easiest to inflame, the slowest to understand. To control this mass, to arouse its best feelings and to curb its worst passions, to steer it safely through this crisis, is the task which now confronts the union leaders.

The union must try to do three things. It must attempt to arrange arbitration. It must keep down violence. It must keep up loyalty. At this point it is possible only to show how the union has entered the struggle.

So far all attempts at arbitration have failed. For not arranging arbitration before the strike was called each side now blames the other. The packers claimed that they had offered to arbitrate twelve hours before the men stopped work. Donnelly replied that the offer had come too late to stop the great strike machine, which had been already set in motion all over the country. The packers claimed that they had sent in this offer but a few hours after Donnelly had notified them of the strike to be called. Donnelly claimed that they had known it several days before. There can be no question that they did know it some time before, and yet they are partly right, for they should have received some official notification.

Since the strike was called several meetings have taken place. The union in its proposition for arbitration made three demands, all of which the packers refused. The first two demands were, that the Arbitration Board should not be allowed to decide on a reduction of wages, and that, pending the board's decision, all workers should go on working at last year's wages. These two demands the union has withdrawn. It still, however, holds to the third demand, which is, that all members of the union be taken back at once into their old places of work as soon as the arbitration begins. This the packers have refused also, on the ground that they cannot discharge the non-union men whom they have already secured to fill some of the strikers' places.

So far the union has made two concessions. The packers have conceded nothing. The fight seems to have begun in earnest. The second task before the union leaders is to keep down violence. Everywhere on fences and

on trees you may see this notice, which is printed in English, German, Lithuanian, Polish and Bohemian:

"We can win if we stand by the union. If we obey the union's rules to molest no person or property, and abide strictly by the laws of this country. All men on strike should retire to their homes and attend their various union meetings for all information. If you follow the above instructions, you will be of great assistance in helping to win this strike. YOUR ORGANIZATION WILL NOT ASSIST YOU IF YOU GET INTO UNLAWFUL TROUBLE."

To keep them out of unlawful trouble the leaders are making strenuous efforts. Yesterday morning at six o'clock I stood at Whiskey Point. It was here in '94 that blazing cars could be seen all along the railroad. It was here that United States Regulars engaged in pitched battles with the strikers. As I stood here with a crowd of strikers I saw a stocky, red-faced, red-haired Irishman come swinging along, dinner pail in hand. He was employed in some minor line of work in the yards and had not considered himself on strike. From the crowd a dozen men jumped out. "Yer a scab!" cried one. "Who said that?" demanded the fiery Irishman, turning short around. "Me! I said dot," growled a huge Dutchman. "What do yez mane by sayin' it?" cried the Irishman, his face growing two shades redder. "We'll show ye," cried the crowd. "Come on!" cried the Irishman. But suddenly a union official rushed up, thrust through the crowd and put his arm on the angry man's shoulder. A few moments later I saw them sitting peacefully together over a cooling can of beer. Soon after that, another union leader drove up in an old buggy in which he had been driving around the yards. "No slugging?" "None at all," was the answer. "Good! Keep it up," and he drove away.

The leaders have asked the squads of police who are constantly patrolling the streets to send instant word to union headquarters when a street fight breaks out. I saw one begin. Two men rushed out of a saloon pounding each other. Both were strikers, but the crowd of a thousand men and women were mostly Polish, could not understand English, and so thought that one of the fighters was a scab. In a moment the street was a sea of angry faces, stones began to fly at the squad of police. The police drew their revolvers and fired. One man fell, shot in the shoulder. Then suddenly down the street came six union leaders marching abreast. In a few minutes they had quieted the crowd. The trouble was over.

The third task for the union is to keep up loyalty. This will be uncommonly hard for this reason: common labor is most easily replaced, and the packers are beginning to fill the strikers' places. Salesmen, buyers, foremen and assistant superintendents and managers of branch stores are being taken from their work in all parts of the country. The packers claim that these skilled men will instruct the new, unskilled workers who are being hired from cities east, west, north and south. This method is being pursued in many cities besides Chicago. It is hard to know just how far to believe the packers' statements of their success. The union claims that it knows just how many available butchers there are in America, for John Joyce, one of the leading secretaries, has received every week during the past year bulletins from every union shop in the country. The union claims that it knows just how many places are empty and how few skilled men the packers can hire to fill these places. It is sending this word to strikers all over the country in order to offset the statements of the packers.

Meanwhile the union has been reinforced by scores of foremen who are in sympathy with the strikers and are unwilling to work with non-union men. The 14,000 engineers, carpenters and other mechanical workmen in the Chicago stockyards are also ready to strike in sympathy. Other organized labor is offering its support.

So the two sides line up and the struggle begins.

(1) Should men be treated as mere expense items or as fellow workers and fellow sharers with the employer.

(2) Shall an industry be developed for the profit of the employer alone, or shall the welfare of the workers be considered of equal or even greater importance?

These are the two questions for the outside public to consider.

July 18—CHICAGO STOCKYARDS.

The Connecticut State Building at St. Louis

BY EMILY S. G. HOLCOMBE

[Mrs. Holcombe is Second Vice President of the Connecticut Society of Colonial Dames and for eleven years has been the Regent of the Ruth Wyllys Chapter of the Daughters of the American Revolution. She is therefore especially qualified to write of the old Colonial Connecticut Building at the St. Louis Exposition, where she is one of the National Commissioners of the Connecticut Commission.—Editor.]

AMONG the State buildings at the Louisiana Purchase Exposition is one already taking first rank and distinguished as the "Gem of the Plateau of States." The Connecticut Building is as pure and true an embodiment of State history and State pride as could well be created. Built upon the lines of a charming old house in Hartford, which was once the home of the literary Charles Sigourney and wife, and later for many years the residence of Lieutenant-Governor Catlin, it represents a type of house and of people characteristic of Connecticut.

The doorway is a wonderfully beautiful example of an elaborate Colonial entrance, and together with some fine interior woodwork once adorned a stately house in Norwich, from which it was removed only last April. As one steps upon the Sigourney porch and enters through the Hubbard-Slater doorway, he feels himself indeed in the atmosphere of bygone days, and standing in a great hall, wainscoted to the ceiling in the fashion so loved by our ancestors, he finds himself surrounded by inheritances from an historic past, which link him to the generations and occurrences long

since passed away. Before enjoying the delight of color and harmony so noticeable in the treatment of the Connecticut house, or the beautiful paintings, the choice specimens of antique furniture, the eye of the visitor is caught by a unique creation hanging upon the wall, there placed other States who through ancestral ties claim kinship with this ancient commonwealth, might be very proud of what Connecticut could fitly present, and would eagerly respond to the suggestions of the hour and the influence of this Connecticut storehouse of treasures, where

Copyright, 1904, Louisiana Purchase Exposition Company

to attract his attention, and if he be of Connecticut stock to charge his soul with an awakened sense of love and loyalty to the grand old State, which perhaps for the first time he now learns is entitled to the name of "The Constitution State." Here is the evidence where "he who runs may read," for the Connecticut coat of arms is placed beneath the title "Connecticut, the Constitution State," and on either side are quotations from renowned historians proving the justice and fitness of the title.

The furniture is all old and genuine, representing the various periods from about 1600 to 1830. This was selected with great care and with the hope that the Connecticut Building would prove to be one of such rare beauty and interest that all citizens of Connecticut, or those of has been made plain "Its story, its purpose and its aim." Distinguished Connecticut artists have loaned wonderful paintings for the adornment of the walls, the walls themselves being covered with choicest silken fabrics of antique design, which are gifts of a famous silk manufactory in Connecticut.

In the room to the left of the entrance hall are fine examples of the First Empire period; a sofa and console table being quite remarkable specimens of the ornate type. In the room to the right is a high mahogany secretary, inlaid, an heirloom from Col. Benjamin Gold. In the hall is a collection of pieces of more ancient date; a six-legged highboy of walnut. feather-banded and entirely original, has "steps" on the top, and on this eminence is a charming variety of pewter. This

is of the 1700 period, and a "Sunflower" or Connecticut chest represents 1660. An oaken "press cupboard" bearing initials and date testifies it was made for E. R. in 1698. Tables of many varieties and interesting chairs, all of the early period before the introduction of mahogany, give to this hall a most ancient and attractive appearance. In the great drawing room is found an elaborate array of beauty. The walls are covered with superb brocade of Louis XV design, in cream of softest tints, brightened by the accompaniment of heavy satin curtains of rich crimson. Here is the famous Chippendale sofa, for more than a century in the Ellsworth mansion at Windsor, which to-day is much the same as when George Washington was an honored guest within its stuff has had to take the place of the original material. Its journey to St. Louis was its first removal from the old drawing room where it had occupied a place of honor since the eighteenth century. There is in this room a bewildering array of treasures, and the lover of the antique might well revel in such a collection, comprising beautiful specimens of Dutch, Queen Anne, Chippendale, Hepplewhite and Sheraton, with a few specimens of choice First Empire; a corner cupboard of mahogany holds an exquisite set of old rose luster china and Lowestofft and Newcastle pieces. A walnut lowboy, feather-banded, with drop handles and everything original, stands below a Washington mirror, the eagle on the top of which commands a view of a rare apartment. Among the pieces one no-

Copyright, 1904, Louisiana Purchase Exposition Company

hospitable walls. This sofa, undoubtedly the resting place of General Washington on the occasion of that visit, was imported with a set of chairs before 1790 by Chief Justice Oliver Ellsworth; the same ornamental brass nails fill the same places, tho a second dress of rose colored tices is a "wing chair," with claw and ball feet; a "kettle drum" oak bureau of the seventeenth century, a "tip table" from the house of Gen. Jeremiah Wadsworth and a wonderful pair of old brass sconces, brought from Venice more than a century ago. In the dining room are an

exquisite Hepplewhite sideboard and corner cupboards, filled with a fascinating array of china, a Pembroke breakfast table, a First Empire dining table and a set of Chippendale chairs. In the library or "genealogical room" are very interesting charts of early Connecticut families. These are executed in water color. Coats of arms, official services, personal details and sketches of ancestral English homes and churches are introduced, making an exhibition of exciting interest to the thousands who boast Connecticut ancestry. The large table in the center of the room is a rare and perfect example of the early oak dining table, and was in use perhaps as early as 1670 in the famous Grant house in East Windsor Hill. Here also is a beautiful maple lowboy from the same house, and a little table with turned legs, which holds a carved "Bible box," and the chair which was Washington's seat in the first Continental Congress, and Governor Jonathan Trumbull's ("Brother Jonathan") chair, in which he sat in the old square pew in the Lebanon church during the Revolution. A quaint and charming desk in the corner was the property of Colonel Knowlton, of Revolutionary fame, and two old Dutch chairs are fine specimens of the 1720 period. Two generous piazzas at the rear of the house look out upon venerable forest trees and abound in comfortable chairs, many being of the Windsor pattern, and a "Desk-Windsor chair," upon which have been written many sermons and poems.

In the four bedrooms are four high post bedsteads, ornamented with beautiful drapings which are exact copies of antique hangings; one has four carved posts, pineapple top and carved headboard; another, with two posts only carved, has a plain headboard; another, a tent bedstead from the well known Leffingwell family in Norwich, and the fourth is a plain cherry "four-poster," long used by Chief Justice Oliver Ellsworth, and the one on which he breathed his last in that home he estimated to be the loveliest in the world. This is the Windsor room, and here is a Chippendale chair, one of a set of fourteen imported

by Gov. Roger Wolcott, and brought by his granddaughter, Fluvia, wife of Col. Roswell Grant, to the Grant homestead. The spinning wheel upon which the deft fingers of Abigail Wolcott Ellsworth spun for the family needs is here also, and an ancient chair from the same Ellsworth house, a Queen Anne armchair from the Hayden family in Windsor of 1710 period, and a still more ancient piece, a table of 1660 owned by Edward Griswold. In company with the Norwich tent bedstead is a very old piece (originally from the same vicinity of Norwich), the Alden highboy, claimed by tradition to have been brought "over seas" in the "Mayflower" by John Alden. This may be doubted, but it was certainly the property of the first Alden in Connecticut, descending through the Alden-Glazier-Preston branch. A Brewster chair in this room is also claimed to have been on the "Mayflower," and tho this tradition may be also questioned, it belonged to the first Brewster in Norwich, Conn., and has descended through various generations of the family.

A souvenir history of early Connecticut, with a catalog of the paintings and furniture, will be given to all those who are interested in Connecticut, the Constitution State.

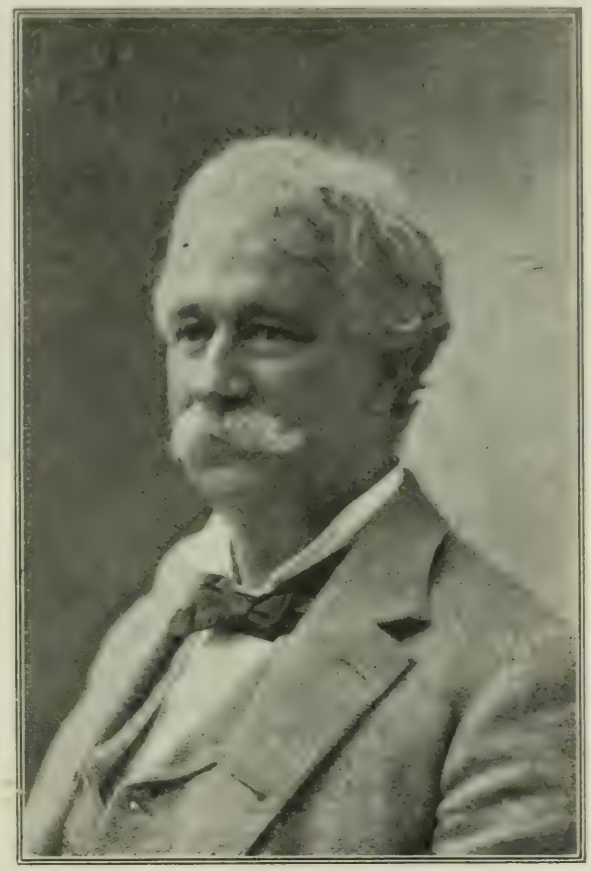
Reminiscences of My Literary and Outdoor Life

BY W. H. H.—"ADIRONDACK" MURRAY

[The Rev. William Henry Harrison Murray died at his ancestral homestead, at Guilford, Conn., on March 3, 1904, in his sixty-fourth year, having been born in the same room in which he expired April 26, 1840. It is a question whether he is best known throughout the country to-day because of the fact that for many years he was one of the most eloquent and distinguished preachers in America, because of the numerous volumes of choice literature which he produced during his varied and every way remarkable career, or because some thirty-five years ago, at a time when the Adirondack region of New York was almost an absolutely unknown and unvisited wilderness, he brought out a little book and delivered a series of lectures which almost in a twinkling set the entire country to investigating the charms of this region, made the Adirondacks a summer resort of international repute, awakened a memorable battle of opinions as to the correctness of some of his more glowing descriptions of the North Woods, and gave to him the sobriquet of "Adirondack," by which he was almost universally known, as author, preacher, lecturer, sportsman, traveler and educator, throughout the remainder of his life. The following article is the last thing Mr. Murray ever wrote, and was completed a few weeks before his death. It will be concluded next week.—EDITOR.]

A DREARIER prospect for a nation was never seen than existed in this country forty years ago, when considered from the standpoint of popular recreation. The gospel of rest had not been preached, and the people as a whole were not only ignorant of, but totally indifferent to, the causes which underlie national development—sound minds in sound bodies.

And this will appear more singular when you consider two things—the stock from which we sprang and the characteristics of the continent. There has never been a dominant race whose cultivated and aristocratic classes were not given to outdoor sports. The Romans, the Greeks, the Medes and Persians, the Egyptians and the Assyrians—a field of survey that stretches 8,000 years backward—each and all, as judged by the habits and pastimes of their upper classes, were passionately fond of outdoor sports. But neither Assyrian nor Greek loved pure air and manly exercise more than the English, whose blood runs strongest in our veins. By right, if the law of heredity had not by other forces been made inoperent among us, we should never have been as we were in 1860.



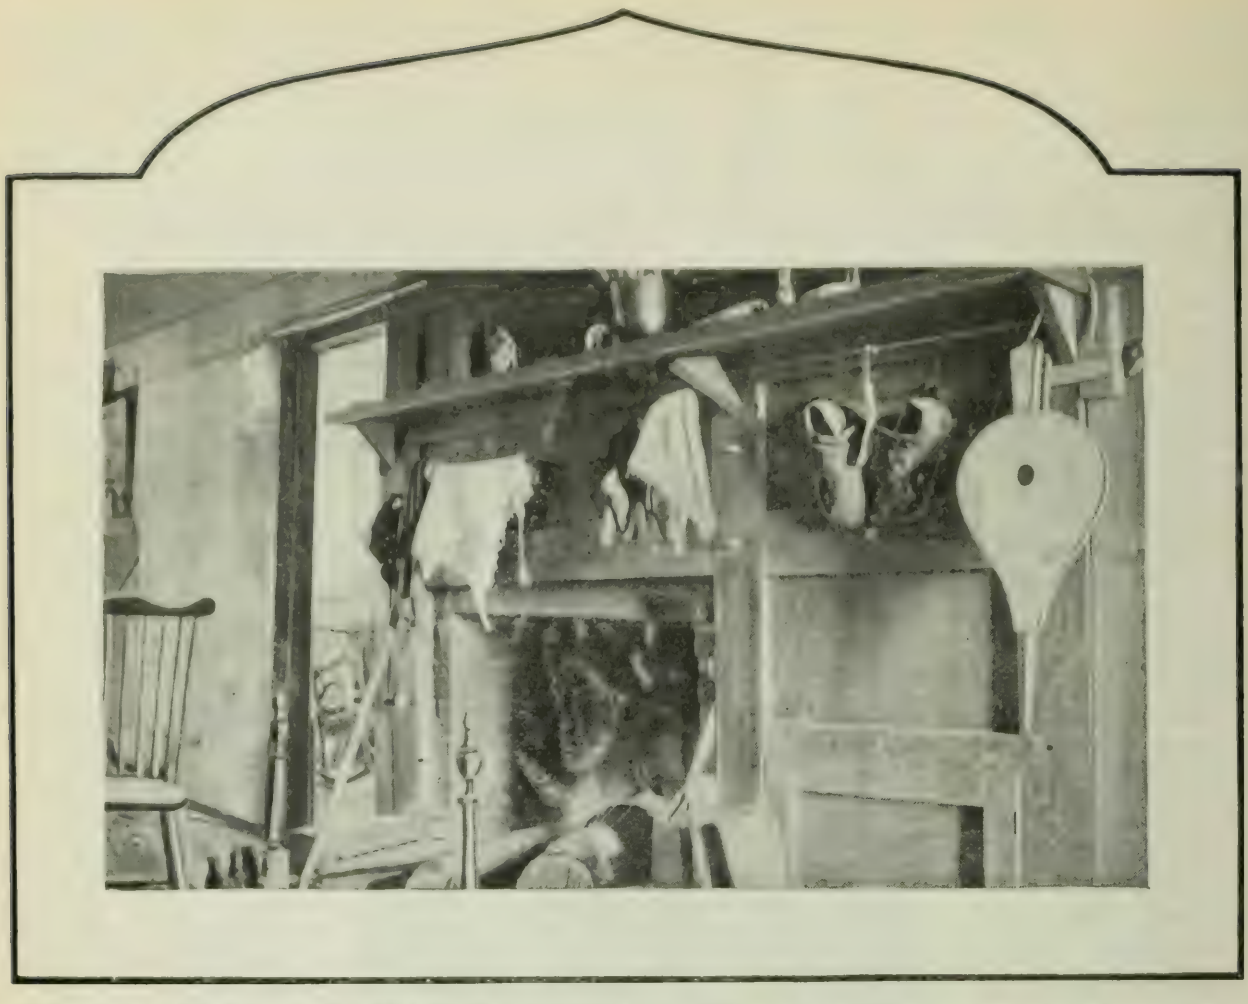
But the national indifference to outdoor life and sport and the ban put upon them by the refined and wealthier class seem all the more strange and inexplicable when one recalls the nature of our national environment. Seas, rivers, lakes and streams everywhere filled with fish, gamy and delicious; woods and mighty forests on all sides full of deer, moose, caribou, buffalo and elk; every stream challenging the trapper's skill, every bay and sedgy pond speckled with waterfowl; the whole continent threaded with unexplored rivers and streams; nature inviting and wooing us to come and see her monstrous mountain ranges, her magnificent forests, her grassy and floral prairie levels, wide as the horizon's rim, and such sweet varieties of scenery as no other nation ever held within its boundaries—how could we, a people thus placed and bred, ever have become so inmuch to the health and loveliness of their women and the vigor and vitalness of their men?

But at last the artificial began to tire its own devotees and the conventional wearied its disciples. The old parental different to the habits of recreation and those noble outdoor sports which add so sap began to stir in the transplanted stock. An uneasiness as to the present condition of things was abroad in the land. "Nervous prostration" began to occur. It was a new name and a new thing. The fathers never heard of it. Death became sudden—horribly sudden. Softening of the brain and troubles

caused by overstress and strain multiplied. Clergymen, lawyers, merchants, doctors all began to feel that the pace was too hot and too risky to keep up. In short, the individual began to think, and when the individual begins to think the beginning of revolution has come.

And no greater revolution ever occurred than that which brought about the entire change in the thought and habits of the American people touching outdoor life and the sports and types of recreation representative of it.

I do not expect that you younger men around me can fully appreciate the vastness of this revolution, because you were not born under the old *régime* of ignorance as to what the body and mind of man required for health and healthy work, and accustomed to the freedom of thought and life of to-day, you cannot realize the bigotry and tyranny of those who controlled the religious forces of that time. The immense influence of ecclesiasticism was fearlessly applied to make ministers artificial. All forces of individualism were fused and run into one mold. Theological seminaries turned out preachers as bakers turn out ginger snaps—all colored alike and all equally and sickishly sweet.



W. H. H. MURRAY
From Photograph Taken in 1898

Independence of thought and method was forbidden the clergyman. Even his wardrobe was canonized, and a man's breeches became a bifurcated section of holy vestments, while the pastorates of larger salaries were given, with a grateful recognition of Providential guidance, to the candidate with the whitest necktie and the deepest shade of pallor on his face. I, myself, being of a conservative tendency, escaped for the most part the persecutions then in vogue to make men in the orthodox ministry say what they knew was not true and seem what they were not, and yet I recall that in one of my first settlements in a small country village the orthodox standing of the church was scandalized because I slid down hill with the boys and batted "sky balls" for the members of the local baseball club to catch; while the crack of my rifle practicing at woodchuck shooting made the venerable sewing society lively for a week!

It is full thirty years since, in one of the oldest and most honored churches of the country, over whose great membership I was as servant seven years, loving and being loved by all, I, in a public address one Sabbath morning used these words:

"I hold that beyond all other men clergymen should live as much as possible outdoors. Like plants they need air, they need sunshine, they need the ministrations of the natural. In this way they become simple, devout, bold and true. Nature inspires no cowards. Nature begets no pedantry. Nature suggests no bigotry. The spirit of devotion tabernacles among the hills. Neither saint nor sinner can truly worship God while he sleeps under a shingled roof. Visions of duty, vast, sublime, overwhelming, never come to one who sleeps in a chamber whose measurement is ten by twelve. You must leave your houses, my people, and go forth into the open air; leave the city and go into the wilderness, and there, far from human habitations, make your bed beneath the stars, and lift your eyes toward the magnificent dome in which they shine, and feel the weight of the immense distances settling on you, before ever you can know the majesty of God or the solemn joy of which the soul is capable when it is lifted heavenward in worship."

The Fireplace and Mantel in the Murray Homestead. Above the woodwork of the mantel, which is 260 years old, hang Mr. Murray's famous old Louis rifle, his paddle, powder horn and drinking cup

But the laity were in the same slough as the clergy. Saint and sinner were wading in the same ditch. They did not know what resting meant. Imagine, a tired out, overworked and nervously exhausted man going to Saratoga between 1860-65 to rest! Between the average cooking at the hotels, the gambling, the horse-racing, the brass bands and the cathartic tendencies of the waters, a man might as well,—well, as between Saratoga and Tophet, a man with good judgment who wanted a quiet, peaceful and sweetly restful vacation would, without a moment's hesitation, choose Tophet.

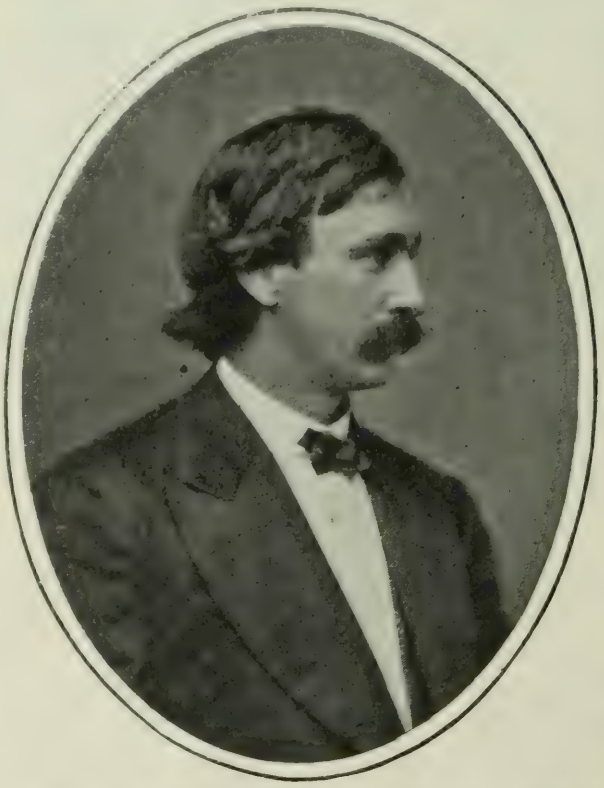
For these thirty years, by voice and pen and example, I have done what I could to make my countrymen and countrywomen love the outdoor life and seek the pleasures and health belonging to it. For such services as I have rendered my reward has been ample.

Such was the state and condition of things in the country touching recreation and outdoor life, when unexpectedly and without any previous announcement, a book was published in Boston by the house of Ticknor & Fields which brought the matter to the front of public discussion. Boston at that time was not improperly called "The Athens of America;" its literary traditions were all of the nobler sort, and the house of Ticknor & Fields represented that which was the best in American literature. What we know as "commercialism" had not touched it with its rot. Only the best in American as well as English thought, whether in poetry or prose, found expression in its printing presses. The list of the authors who honored it and whom it honored, whether old or young, included those whose promise was the highest or whose achievement in letters was beyond question. Longfellow, Lowell, Whittier, Holmes, Emerson, Hawthorne, Motley, Prescott, Agassiz, Phillips, Everett, besides other and younger men and women of equal excellence, but of less volume in performance, made the house famous. At the head of this great establishment, representing what was choicest

and most worthy in American letters, was James T. Fields, the only great publisher that America has ever produced. Educated to a degree rarely attained by an American, gifted with a literary sense amounting almost to intuition, appreciative and critical both, with the suavity of a courtier, but honest as a Christian, his guidance of a great establishment was as helpful to American letters as it was honorable to himself. There is among us to-day no such publisher, no such publication house, no such company of authors, and no such companionship of letters.

Such was the house and such was the man who was at the head of it that in the spring of 1869 brought out a little volume with the title, "Murray's Adventures in the Wilderness; or, Camp Life in the Adirondacks." Having knowledge of all the facts and being the only one living who has, I have been urged by many whose judgment, not to say wish, should have weight in such matters, to give the facts such narration as shall place the popularization of the Adirondacks, its origin and order of development, beyond misunderstanding; for to-day the Adirondacks are admitted to be not only the most uniquely beautiful playground on the continent, but also the best advertised one in the world.

The first thing to be noticed of interest is that this volume, "Murray's Adventures in the Wilderness," which originated not only the movement toward the Adirondacks as an unsurpassed playground, but introduced new habits of thought and practice among the people, was the work of a practically unknown person. The author was a young man some twenty-six years of age, a graduate from Yale and a clergyman who had served in several country churches and had recently been called to the Park Street Church in Boston. This was all that was known or could be learned of him, for he had never been seen or heard from the platform of the lyceum, neither pamphlet nor contribution to the great journals had ever come from him. Nor did he belong to a family of ancestral prominence or literary traditions. And it is safe to say that one week before the announcement of his little volume was made not a single person in Boston or in Connecticut or among the Yale alumni could have suggested the possibility of anything from his pen being published by the house of Ticknor & Fields. And yet it all came about in a very simple way. And as some things, during the years, have been said and printed that were not accurate touching the matter, I will give you the simple facts of the case as they occurred.



When in Yale I had as one of my classmates Josephus Cook, who afterward became celebrated as a lecturer on theological subjects. Indeed, he was a fellow deacon with me in my class, for at that time each class while in the Freshman year elected three of its members to represent the class in religious matters and to serve as deacons in the church during their Senior year. The three of us were supposed to have represented the characteristics of the class. Crosby was of Bangor, Me., and represented its piety, Cook its intellect, and I the possibilities of the position. Cook was a great student and overthought himself. A good many people thought he was crazy. The only trouble that I could ever see with him was that he had brain enlargement, and that was a malady that the orthodox clergymen of that time did not understand. The D. D.'s did not know how to diagnose the case, so when he returned after several years 'study in Germany, he came to me and said, "Murray, I can't get a hearing in the orthodox pulpit of Boston."

Now Cook was a scholar and an orator of great force, and along some ranges of thinking he was the ablest man that orthodoxy had produced since Jonathan Edwards was born, and so I asked him why Dr. ————, who occupied a prominent position in Boston at that time, would not admit him to his pulpit. Whereupon Cook blurted out, "Because he says I am insane." "Oh," I exclaimed; "the only trouble with the Doctor is he does not understand you. He has never had the least touch of your kind of insanity in his family;" and then I added, "Look here, Josephus; I don't know what you think in theological matters and I don't care. You are a ripe scholar and you are going to have a hearing in Boston. Since I came to this pulpit I have surrendered it twice to other parties, once in exchange with Mr. Beecher and once to Newman Hall, of London, to start the subscription list for his Temple

there, and the third man will be you next Sunday." I need not say that Cook was profoundly moved.

A few weeks after, Cook called at my study in a state of the highest feeling, for his success had been sudden and great. Orthodoxy had accepted him as its standard bearer and he saw usefulness and fame ahead. I had evidently done him a great service. And, beyond doubt, he was anxious to reciprocate, and he had come around to tell me of four things that I must do or obtain before I could look upon Boston as captured. And these were the things:

First, I must speak in Music Hall. Second, I must be invited by the old Massachusetts Total Abstinence Society to deliver its annual address in Tremont Temple. Third, I must have a book published by the aristocratic Unitarian publication company of Ticknor & Fields, and, fourthly, I must have a contribution from my pen in the *Atlantic Monthly*. "Well, Josephus," I said, "as I will probably never write a book, and have no wish to be a magazinist nor desire to speak in Tremont Temple, or in Music Hall either, unless some invitation comes to me naturally in the course of years, I don't see much chance of my capturing Boston, as you put it."

W. H. H. Murray, Age 37. Photograph taken in 1877, when Mr. Murray was at the zenith of his Boston fame as a preacher and author

How feeble is the foresight of man, and how unconscious he is to-day of what will be to-morrow. For within a week each one of these four things to which Cook had given such emphasis had come to pass in a most natural way and without plan or effort of mine. For that afternoon a delegation of citizens invited me to deliver a religious address some evening in Music Hall, and another committee came to invite me to give the annual address before the Total Abstinence Society in Tremont Temple. How the other two came about will take a moment to explain.

It is known to many of you that in the early years of my ministerial life I was pastor of the Congregational Church of Meriden, Conn. For a young man my pulpit work was tasking, for my congregation was a large and intelligent one, and from a sense of duty as truly as from a wish to meet my obligations faithfully, I had to be a close student. In order to make myself more perfect in English composition, and, I may add, to keep my mind buoyant and out of conventional ruts of expression, so to speak, I was in the habit each day of doing some small bit of work, at least, of a secular and vivacious nature. Nothing was more natural with one of my nature and habits of outdoor life than to choose Adirondack subjects both for the purpose of literary practice and mental recreation. Hence there gradually grew up a collection of original material that were unique, and being rewritten time and again, were in the construction of the sentences and verbal discrimination as perfect as I could make them. But I certainly never anticipated that they would be published or remembered in after years by myself or others, and they never would have been but for an accident, if anything which shapes life and action may be called an accident.

Now, there was published at that time in the city of Meriden a newspaper called the *Meriden Recorder,* the proprietor and editor of which was a Mr. Luther G. Riggs. "Luther," as we called him, was a *rara avis,* as the phrase is, a small and, I may say, unbound edition of Horace

Greeley. I always liked Luther, for he was a true man at the core and praised his friends beyond discretion and cursed his enemies with most refreshing earnestness. He was a member of the Methodist Church, and no one, so far as I know, ever doubted his piety; at least I never did, for I looked upon him as thoroughly converted, save as to his vocabulary. That, at times became too vivid and picturesque to be saintly.

One day Luther came running to my study in a state of mind not easily appreciated save by some country editor in like circumstances. It was one o'clock and he must go to press at five, and there was three columns of space absolutely blank. He bounded up the front steps and tore into my study without knocking, and described his predicament in language which compelled me in the interest of wise precaution to throw the matchbox into the open grate. "You must give me something, Parson," he shouted. "A section of an old sermon, a portion of a Sunday school address, a bit of temperance talk, a report of a Sunday school convention which was never held—something you have never used—any worthless stuff to fill up the space." By that time I was laughing with boyish abandon, and I exclaimed, "Luther, I have the very thing you want—meets your description perfectly. Here is a bit of manuscript called 'Crossing the Carry.' I have never used it and never shall. You are welcome to it." And I tossed the small roll into his lap, and away he went on the run. An hour later I had occasion to go down to his office to hand in a Sunday notice, and as my head lifted above the top of the rickety stairs and commanded a view of the compositor's room, there stood Luther at a form with the manuscript pinned up in front of him, working like grim death, his face streaked with black marks where he had wiped the tears away with his grimy fingers. In this way the several descriptive bits which made up the bulk of "Adventures in the Wilderness," and which subsequently became so noted, were first given to the world. I do not recall that when thus first published they attracted any attention in the State or received the slightest recognition from the public press.

Now we will return to my study in Boston. The committee which had just invited me to make the annual address in Tremont Temple had bowed themselves out and I was standing in front of the open doors, when my eye chanced to fall upon a roll of newspaper cuttings made from the *Meriden Recorder* of the Adirondack articles which Riggs had published, when instantly there came to my mind the suggestion that I ought to

The Historic Murray Homestead, Near Guilford, Conn., Where for Ten Generations the Famous Sportsman and Author's Ancestors Have Lived. Mr. Murray in the Foreground.

have a book published by the great publishing house opposite, and I said to myself, "Why not take them across the street and see if they will do anything with them?" I give my word that I was so utterly ignorant of the conventional way of procedure in such a matter that I saw no impropriety in approaching unintroduced and unfathered, so to speak, the head of the house, or sensed impropriety in my reckless procedure. And it was the utter innocence of my ignorance and the outspoken frankness of my wish in the matter, coupled with that courtesy for which he was noted, that caused Fields to give me the favorable regard which he did. For no sooner had I entered his presence and told him who I was than I stated briefly and frankly why I had called upon him. "I regret to say, Mr. Murray, that our list of publications was closed last week, and it would be against the custom of the house to enlarge it. And may I ask," he added, "have you the manuscript with you?" And he evidently wanted to make the fall of my expectations as easy as possible. And in return I handed him the cutting from Luther G. Riggs' paper. The change which came over Fields's face as he took the roll was simply indescribable. Pausing a moment as if to study his words, he quietly said, "This house has never printed any manuscript that has been published in small country papers." By this I was perfectly conscious of the blunder I, in my ignorance, had made, a blunder which would have been shameful to me and insulting toward him had I not proceeded innocently ignorant of the proper course to pursue in such a matter. This he perceived, and with charming adroitness and a noble wish to relieve my embarrassment, he said, "Mr. Murray, while we cannot publish this material, I do not doubt much of it will be interesting reading, and if you will kindly allow me to take the roll home with me it will give pleasure to both Mrs. Fields and myself, who have heard of your love of outdoor life, to peruse some of them at our first opportunity."

Two days after I received a note from him asking me if I would kindly come over and call on him for a moment. As soon as I could command the time I went across the street and sent up my card to his office. I shall not while I live forget a single phase of that interview. He received me standing with several chapters of my manuscript lying loosely on the desk before him. "Mr. Murray," he said, "both Mrs. Fields and myself have read these papers attentively. They are very unique. We do not recall anything that is just like them. Here," he added, picking up several leaves, "is a descriptive bit entitled 'A Ride With a Mad Horse in a Freight Car.' May I ask, did you write that piece?" "I certainly did," I replied. "And here is a piece," he added, taking up another set of leaves, called 'Fantom Falls.' May I ask, did you write that?" My reply was again in the affirmative. In like manner he questioned on the chapter called "Crossing the Carry," and I gave him the same answer. Now, friends, in all my pulpit career I had never in all the ups and downs of it allowed myself the privilege of getting mad, and up to this point in the conversation I held myself perfectly in hand. But now I said, "Mr. Fields, you are aware that your interrogations are most unusual for one gentleman to address to another in our position, and I feel at liberty to ask what you mean by it?" "Simply this, Mr. Murray," he said, "your method of interpreting nature and your humor are unlike anything that we have ever seen. This little book, I am confident, is destined to a great career. We have decided to reopen our list this spring and illustrate it in the best manner that time will permit. We also request the privilege of printing in the next month's issue of the *Atlantic Monthly* the descriptive article named 'A Ride With a Mad Horse in a Freight Car.'" And this is the way that the little volume known as "Murray's Adventures in the Wilderness," which inaugurated not only the great popular movement toward the Adirondacks and introduced the new *régime* of recreation, but which has given me a name which overshadows those by which I was christened, came to be given to the public.

Raisuli

BY WALTER B. HARRIS

[Our readers will remember the article by Mr. Harris we published a few weeks ago and recall that Mr. Harris is probably the best authority on Morocco questions in Europe. He has traveled and explored extensively about Morocco and is the correspondent there of the London *Times*. As he was captured himself by Raisuli a short while ago, no one is better qualified to write about this remarkable bandit than he.—Editor.]

RAISULI, the Moorish brigand, has certainly been the "man of the day" for the last few weeks. On his account a squadron of American war ships and a British battle ship as well lie in Tangier Bay. Governments have spent small fortunes in telegraphing, and Ministers Plenipotentiary have passed sleepless nights. There have been panics and warnings in Tangier, where the country houses are deserted—all on Raisuli's account. Nor has this excitement been unreasonable, for this last act of his, the breaking into the country residence of Mr. Perdicaris and the carrying off of that worthy gentleman and his stepson is, even in Morocco, by no means a common occurrence. To find one's drawing room suddenly invaded by a host of barbarous looking armed men, to witness the panic which naturally ensues, and then to be bound and taken away on a long night march over wild hills and kept for five weeks or so by the brigands seems more like a story of the Middle Ages than of the twentieth century. But the details of Raisuli's *coup* are too well known to need further description here. Rather it is my purpose to give some account of the man himself, which I can claim to have some ability to do, as only twelve months ago I was myself the victim of the brigand, and remained in durance three weeks before my release was obtained.

My capture was not so romantic as that of Mr. Perdicaris. I was riding in the vicinity of Tangier, and, falling into an ambush, was carried off at once to the rocky hill of Zenat, where Raisuli was. In half an hour I found myself in his presence. I had known him in former days, before he had taken to a career of adventure and crime, and found him but little changed in appearance. He is a well built, rather heavy man of some five and thirty years of age. A short, dark beard covers his chin, and, like most mountain Moors, he wears his head shaven with the exception of one long scalp-lock, which, neatly plaited, he wears tucked under the folds of a dark blue cloth turban. His costume consists of a short brown "jelab," or hooded cloak, worn over the usual white cotton undergarments of the country. This cloak does not reach below the knees, and his legs are bare. A pair of yellow shoes upon his feet complete the picture. In color he is very white, his skin being strikingly so, but red cheeks and lips give him almost an effeminate look. His eyes, under heavily arched eyebrows, are his best point, tho he is by no means a desperate looking man, and wherever one might chance to come upon him one could not fail to be struck by his carriage and bearing. At the time of my capture he was surrounded by about two thousand men from the local tribes, who had hurriedly collected at the hill of Zenat, on account of an attack that had been made upon the place by the Government troops. The still smoldering houses of the village showed the work of devastation that had so lately taken place, of which I was destined soon to have another example, for Raisuli led me to the sole remaining portion of his house, and, in order to protect me from the threatening crowd of fanatical tribesmen, pushed me into a small dark room and shut the door, he himself, with his faithful followers, guarding it on the outside. The sole light that was able to penetrate into this room was through the cracks in and round the door, and entering as I did from the bright sunlight, I could at first distinguish nothing. I sat down in the dark on the floor, for Moorish rooms seldom contain any furniture, but in a few moments was surprised to feel

that I was reclining on something damp. As my eyes grew accustomed to the gloom I was able to distinguish a recently beheaded corpse lying beside me, in a pool of the still flowing gore in which I was seated! Such was my first introduction to Raisuli's house. As a matter of fact, the man had been killed by the troops and decapitated in order that his head might be taken back to Tangier as a trophy, and I had only been put into the same quarters for the reason that no other place was at hand where, Raisuli thought, I would be safe from the threatening crowd.

Mulai Ahmed Ben Raisuli—to give him his title in full—is descended from an old and respected family of Tetuan. He is a "Shereef"—that is to say, a descendant of the Phophet Mohammed—and the tombs of his ancestors at Tetuan are much venerated, and often resorted to as places of pilgrimage. He is a man of some education from a Moorish point of view, writes classical Arabic in a most beautiful hand, and talks with the accent and intonation of the Moorish aristocracy. I am fortunate enough to possess a fluent knowledge of his tongue, and during the long, weary days of my captivity I think that Raisuli and I discussed almost every topic of conversation under the sun. I found him pleasant and intelligent, yet I knew that, like so many Orientals, I was seeing only the better side of his nature, for he is vindictive and cruel on occasions, as many of his crimes—and they have been numerous enough—clearly show. On one occasion, some seven or eight years ago, he murdered the wife of his brother-in-law, and her mother, a few days after the wedding. The bridegroom was a certain Shereef of Abrish, who had married first Raisuli's sister, and was taking as another wife, which is distinctly allowed by the Mohammedan religion and law, a girl from his own village. This so enraged Raisuli that he proceeded from the mountains to his brother-in-law's house, where he broke in by force and shot the girl and her mother. Only last year he was guilty of almost as brutal a crime, when, having captured one of his former enemies, he sold him to some tribesmen whom he (the captive) had in some manner wronged. Having paid Raisuli the price of his prisoner, the purchasers calmly cut his throat at the door of the room in which Raisuli himself was seated, and where the whole monetary transaction had taken place in the presence of the victim, who well knew his fate. These two instances are sufficient to show that altho Raisuli's manner can be almost captivating at times, it would not do to place too much reliance upon his kindness of heart.

His career as a cattle thief and brigand has not been altogether an uneventful one, for some years ago, while still a very young man, he was caught by the Moorish Government and incarcerated for some years in the prison at Mogador, the most unhealthy and most feared of all the prisons of Morocco. During the time that I was his captive he used to beguile the weary hours by long descriptions of his prison life, and I remember even now every word of the graphic description of an attempted escape, how at nights he filed at his heavy chains and fetters, and after months of work cast them off. Three other prisoners had joined him in his plot to escape, and they succeeded in breaking out of the prison, but the narrow streets of Mogador puzzled them and they lost their way. The alarm was given and the town gates closed, and all were recaptured. Loaded with still heavier chains—the scars of which are deep on Raisuli's ankles to-day—he underwent another two years of imprisonment and fever, eventually to be released on influential Moors intervening on his behalf with the Sultan.

On his return to Northern Morocco he went back to his old life. He collected a band of desperate men and looted village after village. Complaints were made to the Moorish Government on all sides, and troops were sent to effect his capture. They did nothing, or very little, for his name carried fear with it, and every tribesman was his friend and warned him of impending attack. Last year the troops seemed closing around him. On June 16th they attacked his stronghold at Zenat, and the same afternoon I was captured. The troops were at once withdrawn at his demand, and, after long and wearisome negotiations, skillfully conducted by Sir Arthur Nicolson, the British Minister, and the young Shereef of Wazan, I was exchanged for 16 tribesmen, who had been captured and im-

prisoned by the Moorish Government at various periods.

There is no doubt that Raisuli would have made far larger demands had I not had a number of personal and influential friends among the mountain tribes by whom he was surrounded. It was thanks to their energy on my behalf that he was not allowed to add to his original demands any of the extravagant proposals which he has done in the case of Mr. Perdicaris.

Some idea of Raisuli's character can be gauged by his behavior in this latter case. His demands, which have been acceded to by the Moorish Government, were six. (1) The dismissal of the Governor of Tangier; (2) the disbanding of the Northern army; (3) the release of some fifty tribesmen who had at various times been captured and imprisoned by the native Government; (4) the payment of a ransom of $70,000; (5) the arrest and imprisonment of certain Government functionaries; and (6) his own appointment as Governor of five northern districts, extending in all to some 700 square miles of territory. The impotence of the Moorish Government to use any other methods obliged them to give in on all these points, and to-day—for Mr. Perdicaris and Mr. Varley were released yesterday and arrived in Tangier last night—Raisuli is in possession of all that he demanded. It certainly does not read like a story of the twentieth century, for, even tho Morocco is far behind the times, Tangier, it must be remembered, is in view of Europe, contains a large European population and is the diplomatic capital of Morocco, for it is there that the representatives of the foreign Powers reside.

As to Raisuli's future, it is difficult to prophesy. That his punishment will be demanded by the British and American Governments is certain; that he will ever be punished is not certain. His prestige is very great among the tribes, he has now acquired wealth, and by his birth he is a "shereef"—a descendant of the Prophet—and these three facts render his arrest very conjectural. Whether the Sultan could allow him to enter upon his duties of governing the districts that he has extorted by this last *coup* of his is another question. It seems on the face of it impossible that the Moorish Government can allow a man to hold official posts whose punishment two foreign Powers are demanding. Yet if the Sultan confiscates these lately granted honors, it may well be that Raisuli will make yet another daring attack upon Tangier, and carry off some influential European or American, whose fate would certainly be a miserable one, for Raisuli would absolutely refuse to surrender his captive unless the Power whose subject he had seized would guarantee him the full enjoyment of the concessions he has obtained from the Sultan, and no Power in the world could consent to do that. Unfortunately, the Moorish Government is so weak and incapable at the present moment that it is quite impossible for it either to undertake the capture of Raisuli or to be able to give security for the lives and property of Europeans and Americans living in Tangier. There seems to be but one solution, that France, whom all the Powers recognize to have the most important interests in Morocco, should undertake the organization of a police force, which, by aid of patrols, should grant immunity from capture to the subjects of all the Powers. But France hesitates even to perform this simple duty for fear of awakening suspicion and fanaticism in the interior of Morocco, and thus damaging her chances of carrying out a policy of "pacific penetration."

The near future will decide this question, but meanwhile Raisuli remains a present and existing danger. His movements will be watched with considerable interest. He is at home almost anywhere, and seems, no matter among what tribe he may find himself, to be able to procure a house to live in and quarters for his band of followers. His principal residence is at Zenat, only some two hours' ride from Tangier; but with the exception of one or two short visits he has not resided there since I was set at liberty, some eleven months ago. His residence consisted of three or four thatch cottages—they had just been burned down when I was a captive there—with a more pretentious building of stone, consisting of two rooms, with the usual flat roof of the country. The whole collection of buildings were constructed round a sort of open yard, into which at night the cattle and goats were driven. A few fig trees stood in the center of this

yard, giving a welcome shade, and under them a sort of platform, built of stone, had been raised, a little terrace, as it were, for the owner of the place and his friends to sit upon. Beyond the dwellings was a fruit garden, through which a tiny stream of clear water rippled, falling from rock to rock with pleasant music. Quantities of giant canes—as large as tropical bamboos—had sprung up beside the rivulet and waved their tall, elegant heads, bending to every wind. Above the village rise precipices and crags, the ideal spot for a brigand's home. Away below the stony hill sloped steeply to the plain, which stretches away for several miles toward a range of mountains. Whether Raisuli will return to this picturesque haunt of his is doubtful. It lies too near Tangier to be immune from sudden attack, tho the place itself is easily defendable. It is more probable that he will build himself a residence in some tribe less exposed to a military expedition, where he will be able to reside in peace and safety until the exigencies of the situation may necessitate further action on his part.

Raisuli's followers vary in number, according to the success of his raids. After the loot of a few hundred of cattle men hurry to join him from all parts of the country, to desert him again when he is less active. Curiously enough, altho this band of his is composed largely of outlaws and thieves, they behave themselves extremely well, except when turned loose to pillage and murder. They are for the most part men of some little education; that means to say, in Morocco, can read and write. Almost without exception at the time of my captivity they paid every respect to their religious duties, and prayed the regulation number of times a day. As to their behavior toward myself I have no complaints to make. Altho the riff-raff of the tribesmen who had swarmed to the spot were often rough and rude, I was never insulted or maltreated by any of Raisuli's men, and I believe that Mr. Perdicaris has made the same statement with regard to himself. Altogether Raisuli and his band are a strange anomaly—one and all men with pleasant manners when they like, but guilty of any ferocious crime when the spirit moves them. It was my lot to see the mutilated body of a Moorish soldier whom they had just killed, and nothing but a mind of terrible cruelty and depravity could have invented the revolting horrors and indignities they had perpetrated upon the corpse. I should add, in justice, that Raisuli himself was not a party to this barbarity.

Morocco is a country of "ups and downs," and Raisuli has experienced both—gentle birth, a thief, years in prison, a brigand, and now the Governor of many districts and a wealthy man by the concessions that he has been able to extort from the Moorish Government. What his ultimate fate may be it is impossible to say. He may live to a great age and die in the odor of sanctity. His tomb, like those of his ancestors, may become a place of pilgrimage—or his head may be brought into Tangier one of these days held high on the bayonet of a mounted soldier. To the Moor all things are written in the book of fate, and Raisuli often told me that he awaited his future with unconcern, knowing that everything is in the hands of God.

KASBA-EL-BAIDA, TANGIER, MOROCCO.

The Truth About Santo Domingo

BY H. GOODING FIELD

[Mr. Field is an Englishman. He has just arrived from Santo Domingo, where he has spent the past year traveling all over the island Republic and meeting all classes of citizens. He is interested in the commercial development of the country and takes an optimistic view of the situation there.—Editor.]

WHEN the idea of visiting Santo Domingo first occurred to me, I mentioned the subject to a friend of mine in New York—a reasonably intelligent man—and he informed me that he would be glad to give me a letter of introduction to a close friend of his at Manila, Philippine Islands, and who would, undoubtedly, be able to make my trip to Santo Domingo a pleasant one. Looking to the fact that there is a matter of over 20,000 miles between Manila and the Republic of Santo Domingo, it can be safely inferred that the geographical situation of Santo Domingo is not well understood; the ignorance of general conditions in Santo Domingo, in the light of such palpable lack of knowledge, can be well imagined.

While it is a singular fact that this magnificent tropical island, comprising an area of 28,249 square miles, situated equidistant between the islands of Cuba and Porto Rico, has progressed less and is less known to-day than any other part of the Western Hemisphere, the reasons which have caused the lack of development of this marvelously fertile and productive country are, at length, overcome by the establishment of a new, strong and intelligent Government, under President Morales, and the positive and active co-operation with the present Administration of Santo Domingo by the United States Government, whose officials are fully alive to the unusual opportunities offered to American capital in that country. These new conditions insure a discontinuance of political dissensions, an era of permanent prosperity, and an immediate development of its natural and other resources, unsurpassed in any country of the world.

All historical accounts of Santo Domingo agree as to its unusually healthy and salubrious climate. At many points in the interior the temperature, at no season, falls below sixty degrees or rises above eighty-five degrees. Both in the deltas and valleys, and to the very summits of its mountains, the soil is rich and productive, yielding anything which will grow in a tropical climate. The highest mountains in the West Indies are in Santo Domingo, their altitude being over 10,000 feet above sea level.

The Writer at Bonao, Yuma River

It is a well-known fact that the Republic of Santo Domingo has been, and is even still, confounded with the Black Republic of Haiti, which comprises but one-third of the western end of the island, the balance, some 20,000 square miles, being the Republic of Santo Domingo.

During my travels in Santo Domingo—unattended for the most part—extending over a period of twelve months, the honesty of the Dominican strongly impressed me. In this connection the following incident would substantiate these statements. Upon asking a large and prominent merchant of Santiago, an important interior city, the legal process of collecting debts under the Dominican

The Cathedral at Santiago

law, he informed me that their statutes provided the means of collecting, as in the United States, but that in his long experience as a merchant he had not found it necessary to use the courts for this purpose; that his credits to Dominicans covered a large area and, in the aggregate, a considerable sum; a certain date was fixed for payment to him of these advances made—usually the payment was promptly made—but, if for any reason a debtor could not then pay, he gave his reasons, which were always satisfactory, and when payment at another date was promised, it was promptly made. I mention this conversation to show the integrity of the average Dominican farmer or laborer.

It has been asserted in the press that the practice of voodooism is rampant in Santo Domingo. I can positively state that there is not a semblance of truth in this statement. The religion of the Dominican people is Roman Catholicism. I have been a witness, on many occasions, to simple acts of devotion in the most unpretentious huts in the interior and other parts of the republic. The moral standpoint of the Dominican is good. They hold as sacred the marriage vow, and, from my personal observation, family relationship is everything that could be desired. Every facility and courtesy has been shown me and my associates—all foreigners—in our travels by the officials of the Government, without regard to political distinction, and it is everywhere apparent that the foreigner is accorded privileges in Santo Domingo fully in keeping with the treatment received in other civilized countries, the repeated statements to the contrary notwithstanding. There are to-day, in successful operation in Santo Domingo, a number of large enterprises owned exclusively by foreigners, who are, and have been for years, availing themselves of the opportunities presented in that country for the safe investment of capital.

The Dominican of the better class is cultured, with a charming personality. It has been my privilege to attend many delightful musical and literary evenings with Dominican families, but their apparent reserve to foreigners, in their homes, can be easily attributable to lack of large association with the outside world. The country has been, and is still, a *terra incognita,* but fair-minded strangers who have visited the republic cannot but admit that the intercourse with the intelligent Dominican, both from a business and social standpoint, is most agreeable.

A friend of mine—a Belgian, and long a resident of Santo Domingo—told me the following little story, which bears strongly on the faith of the Dominican on matters of religious belief. My friend was traveling in the interior and he met a man laboring under the load of a large barrel of water which he had taken from a stream some three hundred yards distant, for the purpose of watering his small banana and corn patch. As the stream in question was a rapid one, my friend advised the man to dig a small ditch and run the water to his patch, thus obviating the necessity of laboriously carrying the water to his garden. After several minutes consideration on the part of the Dominican, he elicited the following reply: "If God Almighty had intended that the water be on my land He would have put it there." This answer, it can be readily seen, precluded any further argument, and the Dominican is still wearily carrying the water.

I have attended many dances in the coast and interior towns, and what struck me most forcibly was the refinement of the people. Not that such should not be the case, but, in a country—as has been so emphatically stated by Mr. Thorp in a recent number of THE INDEPENDENT—where the civil wars were waged with a

brutality hardly credible to people who do not know the Dominicans, I was dumbfounded to find a people well behaved, courteous and with the same polished manners to be found in other, tho better known, countries.

Santo Domingo, as I have stated before, is a *Terra Incognita*. A lengthy Mining Report, which appeared in the *Knickerbocker Magazine* of March, 1863, contained the following extract:

"During the sixteenth century Santo Domingo furnished more gold than all Europe had previously in circulation. Its exports, during prosperous mining years, sometimes exceeded $30,000,000 per annum. With the introduction of experienced miners and suitable machinery, results equally satisfactory can be obtained to-day. What is known bears but small relation, probably, to the unknown mineral wealth of the island."

It is not perhaps generally known that the extent, character and quality of timber in Santo Domingo is unequaled in the West Indies or any of the South American countries, and embraces, in immense quantities, all the precious and hard woods, such as mahogany, satin-wood, ebony, lignum vitæ, lance wood, roble or Dominican oak, log wood, baitoa, mara, etc., and the long leaf yellow pine. The Santo Domingo mahogany and satin-wood bring from $120 to $130 per 1,000 feet, board measure, in the rough, at any port of the republic. While many of these valuable woods have been cut off near the water courses and the ocean, there are vast and virgin forests of enormous extent of all these precious woods and pine yet untouched for lack of railroad transportation to bring them to the coast and to market. From the Report of the United States Commission sent to Santo Domingo by the United States Government in 1871, among other matters, the report was made that on the mountain slopes, at different hights, grow in abundance both the choicest cabinet woods, as mahogany, satin-wood, etc., and a great variety of timber, especially suitable and valuable in house building and ship building. There is also, apparently, an inexhaustible supply of the most valuable woods which are used in manufactures or which have medicinal value, as logwood, fustic, aloes, etc. In various places the Commissioners saw houses constructed chiefly of mahogany. Within thirty miles of the principal northern seaport were frequently seen large logs of mahogany of the best qualities, undoubtedly left to decay by the roadside for lack of means of transportation. Notwithstanding the abundance of such valuable timber, no saw mill was found on the island.

Manzanillo Bay and Samana Bay, located in the northwesterly and easterly parts of Santo Domingo respectively, are perhaps the most important deep-water and protected harbors in the whole of the West Indies, the depth of water at Manzanillo Bay, as per hydrographical maps of the United States Government, being from five to forty-five fathoms, where the entrance and the harbor will admit, in perfect safety, the largest vessels afloat. It may be noted here that this Manzanillo Bay is immediately upon the line of the great commercial channel from Europe and the United States to the new Panama Canal, hence its immense future importance as a great naval and supply station for the vessels of the world. This is also the bay which the United States Government for many years has contemplated acquiring for a naval station, which acquisition will, unquestionably, be made within the early future. Because of no line of communication with the interior of Santo Domingo from this bay, there is not a habitation to-day upon its shores.

All that is needed in Santo Domingo is capital and enterprise to develop the immensely valuable natural resources of

Hotel Central, Santiago de los Caballeros

the country. Labor is cheap—from forty to fifty cents per day, and intelligent labor at that—and it is also abundant. Vast tracts of wonderfully fertile country await merely up-to-date methods of cultivation to convert them into rich producing areas. Water is everywhere plentiful. Railroad facilities are badly needed in Santo Domingo. The present antiquated means of transportation, with few exceptions in the republic, render impossible profitable and extensive development.

The present Government, under President Morales—a far-seeing, intelligent and careful administrator—is fully alive to the fact that desirable immigration is also necessary to bring about any radical change in the present conditions in Santo Domingo. Whatever the policy of the United States Government will be, it can be reasonably supposed that a country of such unsurpassed resources, known even to the Spaniards of the fifteenth and sixteenth centuries with such immensely profitable results, can no longer remain a sealed book.

New York City.

A Tidal-Wave in the Atlantic

BY T. JENKINS HAINS

Author of "The Wind Jammers," "Mr. Trunnell," "The Cruise of Petrel," Etc.

THE word *tidal-wave* is usually applied to the rise in the sea following in the wake of the moon, computed accurately from tables which show the time after the moon's transit it should take place. There is another meaning to the word, however, when applied to one of the great mountains of water which sometimes precede or follow earthquakes. These huge waves are quite common in the South Pacific, and there is seldom a year in which some seismic disturbance does not send forth a tremendous rolling sea. In many cases they roll across a comparatively calm belt, taking the vessels afloat within the vast limits completely unawares and causing death and destruction to all who do not contrive to weather them safely.

On the day following the first eruption of Mt. Pelée, in Martinique, the British steamship "Aldebaran" (*not her real name*) was steaming across the core of the Gulf Stream in longitude 74-50 W. and about the latitude of the lower part of North Carolina. The day ended fine, but shortly after sunset it began to bank up heavily from the southwest. The wind, which had been light and northerly all day, came in fitful gusts from the southward, accompanied by sudden squalls of rain. By 8 o'clock at night it was blowing a stiff gale from the southwest, and a heavy sea commenced running with the general current; but as the ship was large and heavy she made little of it while running off with the lift on her port quarter.

It was my first watch that evening, and being mate, it was my duty to see that everything aboard was shipshape and secure for the night. The lookout was set and the man cautioned to keep a sharp watch out for vessels, for we were right in the track of coasters bound north. The passengers were all below and most of them were turned in; so I came upon the bridge for a lonely vigil of four melancholy hours without any one to pass a word with until midnight.

After taking command of the ship and seeing that all was as it should be, I began my solitary walk to and fro on the forward part of the bridge to con the ship and pass the time until I should be relieved. We were plunging along into the blackness at fifteen knots an hour and at every turn I would try to get the fields of my night-glasses dry enough to take a quick look ahead. It would be quick work to clear a vessel without a masthead light on such a night, and the wholesome dread of the poorly lighted coasting

schooner began to get on my nerves in a most disagreeable manner.

The hours dragged along until six bells (eleven o'clock), when the captain came on deck to take a last look around before turning in for the night. He was a very timid little fellow, and immediately began to find fault with the lookout kept, claiming that there was not enough diligence shown and that the ship would undoubtedly get into trouble. After fuming around the bridge for several minutes he found that nothing had been gained by his nervousness and he turned in. Just as he closed the door of his room the lightning flared furiously and the thunder crashed with a terrific detonation. This brought the little skipper on deck with a jump and he came rushing for the bridge rail.

It had been his custom to leave the hatches off during the run through the tropics. This was to air the holds, and he always kept them off until the last minute before allowing the battening down which must take place when the sea begins to come on deck. Twice during the night had I suggested placing the covers on as the sea began to increase, but each time had received a negative answer. Now I suggested it again, intending to place them on my own responsibility just as soon as he turned in. This time he acquiesced and I started down the ladder to the main-deck, whistling, or rather piping, for the watch to follow me.

We had been at work only about a minute when the lookout sung out: "Light dead ahead, sir," coming aft to give his cry again.

Before we could get a good look into the darkness a huge form rose on the port bow and tore past not three fathoms distant, the roar of the seas from the two vessels resounding above the gale as they echoed between the high sides. We had not even time to swing a fathom to starboard, and the danger had come and gone in a twinkling. Had we struck it would have meant the end of either one or both ships, for the schooner was plunging ahead close hauled and we were going full speed. Her light had not shown until we were within a few hundred feet of her, and she, seeing our mast-head lamp, knew we were a steamer and that she had the right of way. It was a close call.

Almost immediately following her came a great steamer, heading very slowly into the sea, and while we watched her go past the lightning and thunder suddenly burst forth with a vigor from a squall approaching from the southwest. For an instant the downpour was tremendous, and all the time the lightning flared incessantly. Then the ship suddenly began to roll in a mountainous sea, which sent things tumbling about wherever they were not lashed fast.

All the watch laid aft to secure the after-hatch, for the sea was now beginning to come on deck.

This was not an easy undertaking now, for the ship was rolling decks under at each swing, and a hatch cover adrift was not a pleasant thing to wrestle with. One moment the foam would glisten white below on one side and the next it would show again on the other, coming up along the waterways a full half fathom deep, and to let a cover go or to slip meant to take a long swim.

We struggled on silently for half an hour and finally got the covers on over more than half the hatch, following it with the canvas cover or tarpaulin. Then a sudden bright flash of light and tremendous downpour of water made me look up for an instant.

The sea seemed to have a new horizon close by to the southward. In the glare the horizon appeared to lift, and the ship, large as she was, looked as though she were at the foot of a mighty hill, almost becalmed under its high slope. For an instant I did not gather the meaning of the phenomenon, thinking it was caused by working lying down. Then I realized that the vessel was really rising to some enormous hill of water, which was running after her with prodigious speed.

A shout to all hands to look out was the first thing, and as every one strove for a place of safety the ship's stern began to rise on the slope. High above, the crest of the great sea began to snore into a huge comber. I had just time to spring upon the gipsy-winch used for hoisting and clasp the boom overhead when the crest crashed over us and hurled the ship on her beam ends. The entire after part of the steamship was submerged at least two fathoms deep in clear water, while the rush of foam went clear over the top of her funnel. The quarter

boats, hoisted a full twenty feet above the sea, were torn from their chocks and sent to destruction, leaving nothing save a few splinters to show where they had existed before. The solid water rolled over the opening of the hatch still uncovered and poured down into the hold by the ton, an immense mass of it getting below during those few seconds. The ship seemed to stand still with the shock. For a few moments she appeared to lie dead in the water and settle by the stern. Then she gathered way again and rose loggily to go on her course, a hundred tons of sea water in her lower hold and her boats gone, all caused by that tremendous sea which was rolling silently across the Atlantic through the night.

Had the vessel been going head to such a wave she would doubtless have gone under. The schooner, which was probably the "William Day," of New Brunswick, has never been heard from since. She probably struck the sea a few moments before we did and drove clear under it, or smashed her forward butts in with the tremendous shock.

We were washed as clean as could be of every movable thing, the steel superstructure being the only thing above the main deck left standing. Several doors of this were stove in and the rooms flooded half a fathom deep with sea water, the occupants of the bunks finding themselves up to the edge in water.

Immediately following the great wave came two much smaller ones, and as the last swept along, burying the stern in foam, the wind slacked up and the squall began to break up. In less than half an hour the sky was as clear as a bell, the stars shining and all as peaceful as tho nothing could ever happen on the deep to disturb the mariners who lived upon it. The passengers turned in and enjoyed a comfortable sleep for the rest of the night, and the half-drowned watch were allowed to turn in and get out of their wet clothes. No one was hurt except one sailor, who got jammed by the sea. His bruises were not dangerous and there was a loudly expressed feeling of thanks by the little skipper, who had come off so happily. The next day Hatteras was sighted and the pilot taken aboard. The ship made harbor without delay, and the few passengers dispersed, probably never to meet again, leaving the little captain to tremble and formulate some story to explain the disappearance of his costly small boats.

As to the hight of the tidal-wave, its size can only be guessed at. The great steamship was like a toy under its foot, and her small boats, hoisted high above, full twenty feet above the sea, were buried clean out of sight and swept away. This in spite of the fact that she rose many feet upon its slope before it began to board her. Judging it in this manner, it could hardly have been less than fifty or sixty feet in hight, higher even than the huge seas which sometimes are encountered during hurricanes off the Horn.

NEW YORK CITY.

Nature's Nobleman

BY HELEN COMBES

Not rich, as the world reckons wealth,
Not great, as mere magnitude goes;
But blessed with contentment, and wisdom and health,
Some friends, and perhaps a few foes;
Doing many things openly, nothing by stealth,
And paying his way as he goes.

Not given to publishing wide
The text of his "brotherhood" code,
But ready to stand at a poorer man's side,
To shoulder a share of his load;
And willing, if need be, his meal to divide
With the beggar he meets on the road.

Not ruled by an orthodox creed,
Not fettered by customs that bind,
Not given to preaching, but seeing the need
Of occasionally speaking his mind,
And living the life of a Christian indeed,
By loving and serving his kind.

SEA CLIFF, N. Y.

Literature

Recent Works on Economics

Modern writers on economics are in severe straits for titles. They can choose between "elements," and "principles," and between "economics" and "political economy," but the possible permutations and combinations of these words are not very numerous. This exhaustion of titles inevitably raises the query whether so many books on the same subject are needed. Every professor, of course, observes defects in existing treatises, and thinks that he can serve the interests of his classes by setting forth things correctly. It can seldom be the case, however, that the public is sensible of these defects and merits, and were it not for the compulsory purchases of students, and the semi-compulsory purchases of librarians, we doubt if half the economic treatises would ever see the light. So far as Professor Gide's book* is concerned, this opinion is probably not justified. The translation informs us that the book has gone throught eight editions in the original French, besides being translated into Russian, Swedish, Polish, Dutch, Finnish, Spanish and Bohemian, while this is the second translation into English. The first translation has been very widely used both in England and America as a textbook. On the whole, we are not surprised at this. Professor Gide is an excellent *raconteur,* and his book is pleasant and entertaining. It requires very little severe application from the reader; and, we should say, has required not much more from the writer. The translator has added much matter, with a view to giving the book what he calls "a smack of American 'up-to-dateness' which ought not to be objectionable." We do not object; the work is well done, and those who like that sort of thing will find this just the sort of thing they like.

Scarcely less bulky, and almost as readable, is the second book on our list.† It is especially full on the subject of distribution, and is further distinguished by an introductory sketch of the rise and progress of modern industry in England and the United States. The economic doctrines are carefully worked out, and there is certainly a large collection of facts of greater or less interest and importance. On the subject of trade unions we have looked for some clear statement of the right of a man to sell his labor without the interference of these bodies, but find no very satisfactory declaration. Many would deny "the undoubted fact that in those trades where collective bargaining has been longest practiced there is the least dissatisfaction with it on the part of employers." The builders of New York City would like to be heard on this proposition. In view of recent investigations, the praise accorded to the management of the post office seems excessive. There are certainly many who will question his statement that this service is more efficient than it could possibly be in private hands. The system of tenure of office, the classification of matter, the compensation of officers and of the agencies for transportation are all marked with scandalous abuses.

Professor Nicholson's book‡ is an extremely clever condensation of his larger treatise, and perhaps no better compendium is now available. The plan requires the omission of the greater part of the historical matter which formed a characteristic feature of the larger work, nor can space be spared for controversial matter. These omissions are in part supplied by references at the end of each chapter to books which the author has found useful. Naturally, there is much here that is of especial interest to English readers; but, on the whole, the view of the subject is broad enough to be available in this country.

Least in bulk, but not in merit, is Mr. Bonar's book.§ It has but 200 pages, but it is singularly complete; and when we

* Principles of Political Economy. *By Charles Gide. Translated by C. W. A. Veditz.* Boston: D. C. Heath & Co. $2.00.

† Introduction to Economics. *By Henry Rogers Seager.* New York: Henry Holt and Company. $2.00.

‡ Elements of Political Economy. *By J. Shield Nicholson.* New York: Macmillan Company. $2.25.

§ Elements of Political Economy. *By James Bonar.* New York: E. P. Dutton & Co.

consider how severe the compression has been, it is singularly clear. The account of the English system of taxation is a model of compact and lucid statement. The author calls his book "no more than the beginning of a study," but it would be more properly described as the end of one. No one can write such a book without having thoroughly mastered the science of political economy. It is this mastery which enables a man to put in a paragraph what others can hardly adumbrate in a chapter. The notes in the appendix are extremely brief, but they are of great value and illustrate Mr. Bonar's fine scholarship. Scholars, accordingly, will enjoy this sketch more than the prolonged lucubrations of more prolix authors.

Thwaites's Early Western Travels

As the subtitle of these volumes explains, the series consists of annotated reprints of some of the best and rarest contemporary volumes of travel, descriptive of the aborigines and social and economic conditions in the middle and far West during the period of early American settlement. The editor explains that from the many works of travel published during those early days a selection has been made on the basis of the intrinsic value of the original from the historical side and the present rarity and market value. Certainly no one is more fitted to estimate the intrinsic value than Mr. Thwaites, who stands unrivaled in his mastery of the sources of frontier history.

The first volume contains the journals of Conrad Weiser (1748), George Croghan (1750-1765), Christian Fred'k Post (1758) and Thomas Morris (1764). Weiser came from Germany as a boy, and in New York grew so intimate with the Mohawks as to live with them, and to be adopted by them, learning their language and becoming an interpreter, who, as the Pennsylvania Council said, "spoke their (the Indians) words and our words, and not his own." Thus he was much sought by New York and Pennsylvania to make peace with the Indians. The journal printed tells the story of the first official embassy to the Indians who lived beyond the Alleghanies.

Croghan was an Irishman, who early came to America and settled on the Pennsylvania frontier. He soon went among the Indians as a pioneer trader and traveler, and then became one of the most famous of the British Indian agents during the later French wars. The selections from his numerous journals show Western conditions, first in the period of English ascendency on the Ohio; second, in the period of French ascendency (1754-57), and third, after the downfall of Canada while the French were surrendering their posts.

Post was a simple, uneducated, Moravian missionary, who, because of his intimate acquaintance with Indian life, acquired during perilous journeys to Chrisitianize them, had something to tell which the world wanted to know. Antiquarians and historians have admired the sublime courage of this simple-minded hero and patriot as he proved to be.

Morris, a person of literary tastes, gives his journal real dramatic interest, telling, as he does, his own story of repeated escapes from torture and death, his flight through the woods and his final refuge at Detroit.

The second volume is entirely given up to the journal of John Long, woodsman, fur trader and explorer, penetrating into unexplored regions north and west of Canada. He gives a sad picture of the Indians "debauched by contact with the dregs of civilization." His account of their customs is one of the best extant, treating totemism, religious rites, courtship, marriage, games, dances, food, dwellings, habits of hunting and physical and mental characteristics. All is told with a simplicity, clearness and directness inimitable.

Of the editing itself one needs but to say that it is done by Dr. Thwaites, whose work with the "Jesuit Relations," the "Wisconsin Historical Collections," etc., has left him without a peer in the breadth of his scholarship and the vastness of his contributions. The editor's annotations make the present series worth possessing, even if one already owns the original.

* Early Western Travels, 1748-1846. *Edited by Reuben Gold Thwaites.* The Arthur H. Clark Co., Cleveland, Ohio. 1904.

The Jewish Encyclopedia. Vols vi. and vii. New York: Funk and Wagnalls Company. $6.00.

More than half of this great enterprise is now accomplished, if, as the publishers announce, the work is to be completed in twelve volumes, but it seems that some considerable compression will have to be used in the rest of the topics. The volumes seem to improve as they succeed each other. An extremely fine body of scholars are enlisted in the work —English, French and Germans, Jews and Christians. Pre-eminent among those who contribute to this volume is Dr. E. G. Hirsch, of Chicago, whose own biography happens to come in this volume, and who proves himself a fruitful scholar. One of the best living students of Arabic and Mohammedan history, Dr. Goldziher (whose biography also is included), writes on "Islam." And his name suggests the mention of how many of the famous Jews have names indicating that their ancestors traded or worked in gold, or chose to put the metal into their name. Among these names are: Goldbaum, Goldberg, Goldberger, Goldblatt, Goldenberg, Goldenthal, Goldfaden, Goldfogle (the New York Congressman), Goldman, Goldmann, Goldmark, Goldsmiths of half a dozen different spellings (some thirty individuals), Goldstein, Goldstücker, Goldzieher and Goldziher. Among the articles that attract is one on Hebrew "Grammar," which gives an immense bibliography of the subject. Similar in interest is a list of one hundred books printed in Hebrew before 1500 A. D. It is interesting that Italy was the most hospitable country to this learning. Of much historical value, but not agreeable reading for a Christian, is the article on "Inquisition," which covers Spanish America and Portuguese India as well as Europe, and gives some grewsome pictures of tortures. So the pictures and text on the "Host," with the account of persecutions of Jews who were falsely charged with stealing the wafer of the Mass and profanely piercing it with daggers, are of unpleasant interest. In the illustrations we see the host miraculously dripping blood when thus pierced; and the sacrilegious Jews receive condign and bloody punishment. There are many other illustrations that are less exciting, but of historical or religious interest. Such are the pictures of the "spice-boxes" used in the *Habdalah* ceremony, separating the holy day from the week day. We wish the very charming prayer used over the spice-boxes had been given. And this reminds us that it is the elaborate system of family worship which more than even circumcision maintained the separate existence of the Jews. A very interesting series of *Hanukkah*, or Dedication, lambs are also figured, and we mention a considerable number of *fac-similes* of pages in early books and manuscripts. Under such titles as "Gold" and "Holy Spirit" there is not a little of interest to the Christian theologian bearing on the origin of the "Logos" doctrine and that of the Trinity. The printing is very correct. We have noticed hardly any errors, except once or twice in the Greek. The later results especially of Assyriology are not neglected, except occasionally, as under "Gomer." Much more characteristic representations of the Syrian god Hadad could be found than the broken statue. In Vol. VII the chief article is on Jerusalem, illustrated with fine maps, numerous photographs and a long folded panorama of the modern city. The life of Jesus, "who was born at Nazareth about 2 B. C., executed at Jerusalem 14th of Nisan, 3789," gives the rationalistic interpretation of his character, free from the old bitterness, and is of especial interest as presenting the views generally held by liberal Jews of to-day.

Heart of Lynn. By Mary Stewart Cutting Philadelphia: J. B. Lippincott Co. $1.50.

The art of describing ordinary, every-day life with an effect of absolute reality is a very rare one. It seems simple enough to the casual reader of a story written in this manner; one's involuntary thought often is, "Why, I could have written that"; but as a matter of fact the author who is born with this art or who manages to achieve it is extremely fortunate. That Mrs. Cutting possesses it she proved by her delightful *Little Tales of Married Life*. *Heart of Lynn* is a longer story, and is meant for some-

what younger readers, tho it is a book any one, old or young, might enjoy. Plot it has none. It is just a piece out of the life of a family of brothers and sisters—or, to be literal, one brother and three sisters—who with their delicate mother are thrown by the death of the father upon their own resources. They stick together and fight it out, with all the ups and downs, the funny incidents, the minor domestic tragedies, the moments of despair and the times of happiness that are so common in actual life. Lynn is the character who gives most life to the book, as her energy and courage win success for the family efforts; such a natural, likable girl that you seem to hear her voice echoing through the pages. Lynn's friendship for Raymond Weston, which is evidently to ripen into something warmer, gives a tinge of romance to the last chapters, but it is not a love-tale, and those readers who are led by the mention of the heroine's heart in the title to expect sentiment of that sort in this book will be disappointed.

The Works of Lord Byron. Poetry. Volume vii. *Edited by Ernest Hartley Coleridge.* London: John Murray. Imported by Charles Scribner's Sons, New York. $2.00.

This seventh volume of Byron's poetry brings the edition of his works, thirteen volumes in all, to completion. We have commented on the separate volumes as they appeared, and now only add on this occasion that Mr. Murray, grandson of the original John Murray, famed in his day as the original publisher of Byron and many other notabilities, has achieved what may be called a work of pietas in this monumental edition. It has seemed to many critics that the printing of the innumerable variations from Byron's MSS., along with the established text, was supererogatory, was indeed calculated more to distract the general reader from the simple enjoyment of the poetry than to furnish any sufficient benefit to students. In the case of an exquisite craftsman, such as Gray or Poe, these variations, showing how each poem attained the flower of its final form, are both interesting and valuable; but with a rapid, negligent writer like Byron it is not easy to see wherein lies the excuse for printing such a mass of rubbish. However, the scholarship or pedantry of the day demands this kind of impedimenta to its enjoyment and will look with satisfaction on the labors of Mr. Coleridge. As it is, this edition, with its elaborate notes, must remain authoritative for many years, perhaps forever. The greater part of the concluding volume is given up to an index of proper names and subjects in the poems and to a fairly complete bibliography of Byron in English and foreign tongues, furnishing a strong comment on the fame of the poet throughout the world and an answer to those who cavil at his genius. It contains also some eighty odd pages of "Jeux d'Esprit and Minor Poems," including a few stanzas hitherto unprinted. The most interesting of these new poems is a "Song to the Suliotes," evidently composed just before Byron's death while he was aiding the Greeks. It is little better than easy doggerel, as the first stanza will attest:

> Up to battle! Sons of Suli
> Up, and do your duty duly!
> There the wall—and there the moat is:
> Bouwah! Bouwah! Suliotes!
> There is booty—there is Beauty,
> Up, my boys and do your duty.

Social Progress: A Year Book. Edited by Josiah Strong. New York: The Baker & Taylor Co. $1.00 net.

This is a book which will prove of the utmost value to students of sociology, economics and politics. All of the more important facts and statistics relating to social questions are given, and there are also directories of the various trade-unions, labor societies and philanthropic and reform organizations, and a well-chosen bibliography. No such compilation of social data has before been published in America. Despite the great care which has evidently been exercised, a number of minor errors have been allowed to creep in. The figures on farm tenantry (p. 25) are wrong; the percentage of tenant-operated farms in the United States in 1890 was 28.4, instead of 34.1. "Traut," the author of a pamphlet on trade-unions (p. 246), should be "Trant." The figures regarding the Socialist vote in the United States (p. 136) are misleading on account of the omission of the vote of the Socialist La-

bor Party. The abbreviations given with the addresses of social reformers (pp. 248-250) are meaningless without explanation. Other defects of the same kind might be pointed out, but they are minor ones and only slightly impair the general worth of the book. Much of the credit for the excellent character of the compilation is due to the assistance of the Rev. W. D. P. Bliss, the author of "The Encyclopedia of Social Reform."

The Jewel of the Seven Stars. By Bram Stoker. New York: Harper & Bros. $1 50.

This story is woven out of the black arts of sorcery and witchcraft about the murder of one Trelawny and his friends. Trelawny is an Egyptologist and among his curios is the mummy of an Egyptian queen. Jealous of a certain jewel of seven stars, which has been taken from her tomb, her astral shape finally accomplishes his death. The book abounds in wild situations. Trelawny is repeatedly wounded by a seven fingered hand, he is dragged about the room by an invisible power; and finally, in an imprudent effort to resuscitate the royal mummy, those present die of fright, and are found peeping through ghastly stiffened fingers at some unimaginable horror. There is a love story, of course, but this is very crudely developed, and the interest really centers about the scientific experiments with the mummy.

The Sign of Triumph: A Romance of the Children's Crusade. By Sheppard Stevens. Illustrated by H. C. Edwards. Boston: L. C. Page & Co. $1.50.

Simple, direct, unadorned by any trick of style, here is a book that holds one in his chair till the reading is finished. Therefore, if he wishes to turn his light out at the proper time, the reader should anticipate the hour by four ere he opens the chronicle. The author is to be congratulated upon her judgment in weaving a historical background, and the skill with which she has shot in her thread of romance until the figures of her story stand individual and clear, yet as resultant from the forces that made those centuries what they were as the event itself, "so pitiful and so marvelous," which swept out of France and Germany in the year 1212 a hundred thousand children to such tragic ends that death was the least of them. Mrs. Stevens never forgets that she has a story to tell. Not an incident is drawn but bears directly upon the narrative, hence the book has unity unusual in the historical type of novel, where temptations are so many to digress. Three characters in chief keep the reader's attention from the time to their introduction: the child Raoul, who disappears from the Castle of Dreux to join the Children's Crusade at Vendôme; Noel, a gentleman of England adventuring in France, and come close to vagabondage till love for the child redeems him; and brave Lady Aliénor, who holds her boy's estate against many enemies until through Noel's devotion he is brought back even from the slave ships taking thousands of trusting French children to a fate worse than death in Africa. In the tale itself there is nothing somber: there is action in plenty, struggle and success, but the author's prophecy remains:

> "If once in imagination you have heard the tramp of those myriad small feet, they are not easy to forget, and to read the simple chronicle of their wanderings is to read through a mist of tears."

The Vineyard. By John Oliver Hobbes. New York: D. Appleton & Co. $1.50.

This novel is like a wide canvas, upon which the author has painted character, temperament, love and some human frailties with a power of delineation that Thomas Hardy himself never surpassed, and in scenes finished to the last delicate detail of light. Interest does not depend upon the incidents of the story, but upon the motives from which they develop. The men and women in it are given to unhealthy self analysis, but they do it thoroughly. And more painful philosophy of life is rarely found in the pages of any book. It is a sort of classic in the emotions of grief, love and self-contempt. But from the literary point of view few works of fiction surpass it in form or excellence of style. It has the charm of real art, and for this reason the "average reader" may be disappointed in *The Vineyard*. It is not a vaudeville stage upon which vulgar natures ape great

parts. It is a serious drama, composed without reference to the taste or demands of the average reader.

The Adventurer in Spain. By S. R. Crockett. New York: Frederick A. Stokes & Co. $1.00.

The title of this volume is well deserved. Mr. Crockett is really an "adventurer," and not a tourist, in Spain. Instead of being wearied by long, excellently written descriptions of the dons and castles of the country, we follow the traveler from one delightful story to another; the scenes and actors in these do really include the gentlemen and architecture of Spain, but that which distinguishes the book from the average volume of the kind is the fact that the author gets himself smuggled across the Pyrenees and comes literally in contact with the real life of the real people of Spain. And yet he preserves that dear illusion, the romanticism which has for so long belonged to that imagination of the country.

A Little Union Scout. By Joel Chandler Harris. New York: McClure, Phillips & Co. $1.50.

Before we have time to bow ourselves from the presence of Cyrus Townsend Brady's little dotted swiss dressed "Traitor to the South," Joel Chandler Harris appears leading a "little Union Scout" by his literary hand. Really the older Mr. Brady and Mr. Harris grow the younger, the less conventional their heroines get. This "scout" is a woman masquerading as a man. By the way, if there were as many female spies in the Civil War as have since been revealed in Southern fiction, the Confederates alone had enough of them to make a lady regiment. There is nothing to recommend this story except the brilliant report of Forrest's skirmishing and the excellent negro character likeness found in "Whistling Jim."

Cynthia's Rebellion. By A. E. Thomas. New York: Charles Scribner's Sons. $1.50.

An idle tale for an idle hour. The heroine is a coquette, all the men are flirts, and the author himself has a gay mind. The issues involved are pleasantly romantic, nobody is called upon to resist overwhelming temptations or to make dying heart sacrifices. The scenes are laid in Road Island, near Point Judith and laid cheerfully, with enough sunlight, flowers, hills, grassy lanes, to go well with the young lady's muslin dresses and Cupid moods.

The Grafters. By Francis Lynde. Indianapolis: The Bobbs-Merrill Co. $1.50.

A preposterous book, in the writing of which the province of the impossible has been invaded from all sides. The "grafters" would appear to be the members of a Populist administration in a certain Western State, perhaps Colorado. But the appellation might be, with almost equal appropriateness, given to most of the other characters, particularly to the hero, Mr. David Kent. The author is doubtless unaware of this, for his confusion regarding some of the most elemental principles of conduct is obvious. A very brief course in ethics, law, politics, civil government and the theory and practice of labor organizations would have saved him from some of his more striking lapses from the reality of things. It is a pointless and uninteresting story, even tho by indulgence in many kinds of extravagance an effort is made to generate a thrill.

Daniel Webster for Yourg Americans. With an Introduction and Notes by Charles F. Richardson. Boston, Little, Brown & Co. $1.50.

The "Young Americans" for whom this book is intended must be college men of 21 years and over. The formal introduction by the professor of English in Dartmouth could not be read intelligently by a boy. Edwin P. Whipple's essay on "Webster as a Master of English Style" is well enough for grown men, but is no food for youth. The illustrations are so poor as to be a bore to anybody. The reprinted speeches—some twenty in number—are the conventional ones that have been repeatedly chosen for reprinting in small editions. The gratuitous insertion of the Declaration of Independence, the Constitution and Washington's Farewell Address do not increase the value of the book as a new contribution to Webster literature.

The Church Catechism the Christian's Manual. By the Rev. W. C. E. Newbolt. From the Oxford Library of Practical Theology. New York: Longmans, Green & Co., 1903. $1.40 net.

This work on the "Instruction," prepared for the children of the Church of England, regards that formulary from the position of the more "advanced" party in that Church. It is not so much an exposition of the doctrines taught as of the principles that underlie the preparation of the child for the exercise of his faith, the performance of his duty, and the enjoyment of his privileges as a Christian. Hence it is mainly addressed to those who are responsible for the training of the child in Christian doctrine. While it is essentially intended for members of one particular communion, some of its sections—*e.g.*, those on faith, practice, service and prayer—may well meet with a wider approval. The author is one of those who believe in the necessity for denominational teaching in elementary schools, and he deeply regrets the Act of 1870, which largely deprived the Church of England of that control of primary teaching which had long been considered her undisputable right. His strictures upon this subject will not find favor in this country, even from some eminent divines of that branch of the Church which is in communion with his own. The divorce of denominational teaching from that secular education which the State enforces is too irrevocably pronounced ever to be reconsidered.

How to Make a Flower Garden. By L. H. Bailey. New York: Doubleday, Page & Co.

People owning gardens cannot always have in their libraries the "Cyclopedia of American Horticulture," by L. H. Bailey. *How to Make a Flower Garden* is a moderate sized book, well printed, freely illustrated and of reasonable price. It is a small cyclopedia full of practical information. The book contains nineteen chapters on various garden subjects, beginning with "Annuals" and "Perennials" and ending with "How I Built My Country Home." Each chapter has from one to eight different writers. The introduction and five of the fifty-five articles are by L. H. Bailey. His work gives authority to the book. Five articles are by W. C. Egan, two by Edward J. Canning, two by Patrick O'Mara. The remaining forty-one subjects treated are written each by a different author. Of course, such a book cannot have an even literary style. One writer is concise, while the next bristles with quotations, is flowery or redundant. But each writer gives practical suggestions or personal experience. The three chapters on "Shrubs and Shrubbery" are especially valuable. Mr. Bailey urges the use of native shrubs. He says:

> "We are content only when we appreciate the region in which we live. When hubble bush is the commonest bush, then hubble bush should be to us the best bush."

The article on the trimming of shrubs is most helpful and compact. "Home Propagation of Shrubbery" is Frank H. Sweet's account of his experience and success in this work. The reader desires at once to start a nursery for shrubs, the process seems so simple and easy. The chapter on native ferns is very meager. Only seven of our native ferns are mentioned. The *Osmunda Claytoniana* is as decorative as the *O. cinnamomea.* The *Dicksonia* grows easily, but is not mentioned. Of the *Dryopteris* the Christmas fern is the only one mentioned, while the New York fern grows like a weed and the shyer *Goldieana* and the beautiful *Braunii* can be grown with some care. Nothing is easier to grow than the ostrich fern or the lady fern. Over forty varieties of native ferns can be grown near New York. The list of plants for rock gardens is very full. The book gives much information for garden lovers. The Appendix has many lists of plants for different uses and also a dictionary of plants with rules for their cultivation.

The Standard of Pronunciation in English. By Thomas R. Lounsbury. New York: Harper & Brothers. $1.50 net.

Rare scholarship, sound judgment and a witty and graceful style are happily combined in this admirable little book. The standard of pronunciation is sought in many fields; but, altho "superior" persons, taking pride in their membership in an inner circle or their residence in a favored community, assert that they possess this standard, it is found to be an elusive and uncapturable will-o'-the-wisp. The author calls attention to the first recorded attempt to fix a standard,

that related in the twelfth chapter of the Book of Judges, when the men of Gilead slew so many thousands of the children of Ephraim because of their inability to pronounce the word "shibboleth." Times have changed, he declares, and with them the penalties for certain outrageous acts; but, tho those of us who are certain we possess the only infallible standard can no longer exterminate orthoëpic malefactors, "the fate which befell the Ephraimites is the kind of fate which in our secret hearts we all feel to be the one strictly due to those perverted and perverse being who will persist in pronouncing words in a way we deem improper." The earlier history of works on orthoëpy, beginning with James Buchanan's small dictionary (1757), is very learnedly traced, and the more important divergences of the chief authorities are compared. Colloquial mispronunciations are shown to be in many cases archaic—survivals of what at one time were correct pronunciations. On the whole, pronunciation tends to conform more and more to the printed form. Everybody reads, to an extent uncommon in earlier days; and, excepting for the simpler Saxon words which we get by ear in childhood our first acquaintance with words is generally through the printed page, and hence we tend to pronounce according to the value of the letters. Under this tendency the accentuation of syllables becomes more uniform, and letters which once were silent or slurred attain their full phonetic value. So that, were it not for the ridiculous spelling of many of our words, we should in time probably reach an approximate uniformity in utterance.

Pebbles

GOLFING PARODIES FROM LONGFELLOW'S POEM.

I DROVE a golf ball into the air,
It dropped to earth, I know not where;
For, so swiftly I drove, my sight
Could not follow it in its flight.

I breathed a word into the air,
It fell to earth—a naughty swear;
For who has sight so keen and strong
That he won't utter a word that's wrong?

Long, long afterward, in a drain
I found my gutty ball again;
And the swear, from beginning to end,
I heard one day when I "stymed" a friend.

I baffed a ball with a brassey air,
It fell in a guttie—I knew not where;
For so swiftly it flew, my links-like sight
Couldn't feel dormy during its flight.

I putted a stimy oath that ere
'Twas holed made spoons and mashies swear;
For, as you lie, club cleeks are loth
To scruff or bunker a well-tee'd oath.

Long after I heard in a lofted hall,
By a niblick licked, my caddie bawl;
And my gobbled oath, from beginning to end,
I found in the mouth of a foozling friend!

I struck a golf ball into the air,
It fell in a hazard, I tore my hair;
For so wildly it flew, that the wight
Of a caddie was out of sight.

I uttered some words. Such a swear
Had never fallen on human ear,
For who can equal the language strong
Of a golfer whose ball's gone wrong.

After the round, in the caddie's hand
I found the ball, and made him stand.
And my words, from beginning to end,
I repeated again in the ears of my friend.

I hit a golf ball with all my might,
It fell to earth five yards to the right;
But the head of my club flew far from the eye
And naught was heard but a distant cry.

I breathed an oath into the air,
That I had learned I know not where;
It sounded so loud and long and deep,
It nearly made the caddie weep.

Searching afar my club head I found
Had stretched a friend upon the ground;
And that oath, from beginning to end,
I heard again from the lips of that friend.

I drove a ball from off the green,
More awful! "slice" was never seen!
It rolled a few yards off to the right,
While the head of the driver was lost to sight.

I breathed some words about the game,
Calling it every horrid name:
For who has a temper so mild and calm
That he doesn't sometimes say, "Oh, dalm!"

Shortly afterwards, *as a joke*,
I was told the tale of my foozled stroke;
While "the words," from beginning to end,
I heard my caddie repeat to a friend.

I drove a golf ball into the air,
It fell to earth, I knew not where;
For I, alas! was short of sight,
And couldn't follow it in its flight.

I kicked my caddie into the air,
He fell to earth, I knew not where;
For I deemed as a thing exceedingly vile
That inferior caddie's superior smile.

Soon, soon after, I found the ball—
It had hardly budged from the tee at all;
And the caddie was standing sardonic'ly grim—
I had kicked my opponent instead of him.

The Nomination of Mr. Folk

Mr. Folk was nominated for Governor of Missouri because a great majority of the Democratic party in that State like an honest man and prefer honesty to rascality in public office. Such is the preference of a great majority of our people, in all parties and in every State. Whenever the issue between honesty and corruption is clearly set before them by a leader whose courage has been proved as Mr. Folk's has been, there is no room for doubt as to what they will do. They will stand by him.

To some in Missouri the situation there three years ago may have seemed hopeless. The organization of the dominant party at the capital, in the Legislature, and in the chief city of the State was under the control of bribe-givers and bribe-takers. Statutes were sold for a price; the municipal franchises of St. Louis were invariably the subjects of corrupt agreement. Common honesty had no place in the Municipal Council or the Legislative Chamber. Recent confessions show that these conditions had prevailed for many years. This young prosecuting attorney surprised the thieves by proceeding to perform the duties of his office. When we consider the forces arrayed against him and the influences exerted for his restraint, it must be admitted that his success has been extraordinary. His own nomination had come from the corrupt machine that controlled his party. He knew that he must attack men high in official power, men possessing great wealth; that he must contend against those who were influential in the government of the State. It has since become known that even in the highest courts his course excited opposition.

But he simply went on to do his duty and be faithful to his oath. No influence whatever could stay his hand. Fortunately, he found grand juries willing to support him. And what a mass of wickedness he has uncovered! The conspiracies of the Municipal Council have been laid bare; the corruption of State legislators has been exposed, sometimes by confession; bribe-givers and bribe-takers have been indicted and convicted; thieving millionaires have been driven into exile. And all this remarkable work has been done by him with modesty, without self-advertisement, with unfailing courage and with great earnestness.

The qualities thus revealed are those which the people must have in their public officers, if they are to be well served. Appreciation of them is best shown by promoting those who possess them to places of the highest authority. Fortunate, indeed, is a State that has a Folk whose integrity and courage and ability have been tried and proved before all men, and who can be raised to the highest office in the people's gift. There are other States where Folks are needed. The raw material for such public officers is not wanting in them, but for lack of opportunity or on account of restraining conditions, not a great quantity of it is brought into the public service. Such evils as those which Mr. Folk has so persistently and successfully attacked exist in other American cities, but in no other, we hope and believe, have they become so great and so deep-seated as in St. Louis. Wherever they are found there is work for a Folk. Some day a Folk will arise in Philadelphia.

It will be observed that the nomination has worked no change in this fearless prosecutor:

"I am profoundly impressed with the responsibility of my position. My mind is full of anxious desire to perform well the part that has been assigned to me. I have been fighting corruptionists with all the powers at my command, and have lashed them with the whip of the law. I have no favors to ask of them, and no quarter to give. It is unrelenting warfare to the end. The battle against boodle has only commenced in Missouri. If I am elected to a larger field of opportunity, I propose to make Missouri the most unhealthy place in all the land for corruptionists to operate in. With your help, and so long as God gives me life and strength, I will combat the things that dishonor and oppress."

These were his words to the convention.

In one of his speeches during the canvass he had said:

"If I am made Governor the first rumor of bribery at Jefferson City will be answered by an investigation thorough and complete, if I have to conduct it myself. I propose to stamp out bribery in the legislative halls. If any bill is passed for sandbagging purposes or by the use of money, I shall not hesitate to veto it. I will not permit railroads to make the Legislature a tool of corporate interests. I shall see that railroads and all other interests, as well as individuals, are treated fairly and justly. They shall have all the rights the law accords to them, but no more. I propose to put an end to the 'Indian' business [referring to the intimidation of voters at the polls by gangs of hired ruffians] in Kansas City and St. Louis. Every Democrat, whether he be for the machine or against the machine, every Republican, every Populist, every Socialist, every man of every party and of no party, shall have the right to go to the polls and vote just as he pleases without interference, and without being slugged by a lot of ruffians."

But how is Mr. Folk to obtain the legislation he desires—concerning bribery, franchises, direct nominations, etc.—from a Legislature not in sympathy with him, if such a Legislature should be elected, and how is he to accomplish his projected executive reforms if the people elect Mr. Cook and Mr. Allen, whom his machine enemies induced the convention to nominate for Secretary of State and for Auditor, respectively, and who by virtue of their offices would be powerful members of important boards? His foes in St. Louis and elsewhere, expert in politics, procured for these men in many places instructions which were thoughtlessly accepted by honest delegates, and which these delegates would not disobey. The same foes will strive to elect a Legislature that will give him little or no support.

The Republicans of Missouri can relieve him of these two dead weights on his ticket, and can assist in electing a Legislature that will hold up his hands. It is their duty to do it.

Mr. Folk should be nominated for Governor by the Republicans at their convention, and the remaining places on their ticket should be filled with the names of Republicans who would fight with him against corruption and injustice. He is to be Governor; the Democratic ring cannot defeat him. The defection of Democratic bribe-givers and bribe-takers and their friends will be much more than made good by Republican votes. He ought not to be hampered in office by the opposition of the ring's two candidates for subordinate places. The situation is such, and the need of Missouri is so urgent, that mere partisanship should be laid aside, so far as Mr. Folk is concerned. The good men of Missouri, all the foes of that astounding corruption which has shocked the civilized world, whether they are Republicans or Democrats, should now stand together, not only for his election, but also for the defeat of his enemies and to give him a free hand for the good work to which he has been called.

The Alleged Wickedness of War

We confess that we have been surprised by the editorial comments upon Count Tolstoy's superbly fallacious article in the *London Times* upon the Russo-Japanese War. The article is magnificent in the grandeur of the truth that it stands for and beautiful in the simplicity of its appeal to the human tiger to become a gentle and long-suffering tiger, henceforth. Most of the journalistic comments upon it have been trivial or worse. They have tried to refute those arguments that are irrefutable and have betrayed a blank unconsciousness of fundamental fallacies.

The cruelty and the waste of war are immeasurable, indescribable. To the extent that war is preventable every man who apologizes for it, or who helps to precipitate it, is an incarnate devil, whether he sits on a throne, writes newspaper leaders, or mumbles ecclesiastical gibberish over candles and incense at high altars. So far Count Tolstoy is right, and there is something as refreshing as a wind from the steppes in the straightforward truth-telling that he bestows upon all driveling fools that try to "reconcile" war with the Christian Gospel. If the Christian gospel has any content whatever, it is good-will, gentleness and justice. To talk about reconciling war with the spirit of peace is to blaspheme against common sense.

Not less inane is the attempt to reconcile war with reason. War, as every man knows whose wits have not been fuddled

with closet philosophy, is an explosion of instinct, while reason is psychologically the antithesis and inhibitor of instinct. Psychologically there is no difference whatever, except in point of magnitude, between the conduct of a nation that unnecessarily goes to war and the conduct of an infuriated baby that tries to claw its nurse's eyes out. In neither case have motor-impulses been brought under the control of reason.

It is at this point that the splendid truth in Tolstoy's fearless indictment plunges headlong over the precipice of fallacy. The old Count pleads with instinctive, half-savage nations, with the pathetic earnestness of a man who calls on devil-fish to be magnanimous.

Count Tolstoy has as little respect for science as for ecclesiasticism, and he therefore necessarily goes astray when he approaches the real difficulties of his subject; for science alone can guide us to true opinions upon the ethics of war. Now the beginning of science is discrimination, and the beginning of a sound moral doctrine on the subject of war is a discrimination made between those nations of the earth that have attained a sufficient degree of reason to solve the problems of existence by intellectual means, and those nations that are still in the instinctive or motor-impulse stage of their evolution. This is a discrimination that Count Tolstoy is incapable of making, and which it would be humiliating for him to make if he were capable. Great Britain and the United States, and possibly Germany, France and Italy, are on the whole rational enough under ordinary circumstances to perceive the folly and the wastefulness of war; Russia is not; the barbarian peoples of the earth are not. This is the fact, the condition, to which our ethical theories must be adjusted.

So long as this condition persists one of three things must be done. The reasoning peoples must put forth their best endeavors to guide, restrain and educate the instinctive peoples by intellectual and moral means if possible. Failing in any instance to accomplish this, they must meekly stand still and be slaughtered; or, finally, they must resist aggression with force.

The most inspiring fact of modern times is the civilizing activity of the reasoning nations. When the history of the nineteenth and twentieth centuries shall be seen in true prospective, five centuries from now, the marvelous progress that has been made in disciplining the millions of mankind, in developing some rudiments of reason in them, in restraining somewhat mere savage impulse, will stand forth in splendid relief. But the work is only begun. From time to time there will be wild outbursts of savage fury that will have to be quelled by means that brutal beings can understand. From time to time also, nations half-instinctive, half rational, like Russia, will try to encroach upon the preserves of other peoples and will have to be resisted in the interest of justice.

If these plain scientific deductions from obvious facts are accepted, the alleged wickedness of war becomes a question of particulars. We cannot say with Tolstoy that war is always and everywhere wicked, just because it is monstrous, horrible, insensate in its cruelty. Earthquakes, volcanic eruptions, floods and conflagrations also are monstrous and horrible in their insensate destructiveness, but we do not say that these inevitable things are wicked. It is wicked not to try with every resource at our command to raise the brutal, instinctive, aggressive masses of mankind to that level of rational development at which they will begin to substitute intellectual for physical struggle. It would be not less wicked to allow a savage or a crafty and unscrupulous Power to place the yoke of subjection upon any people that has attained intellectual and moral freedom.

A Plea for Color

The American that visits various summer resorts of his own country, whether in the mountains or on the New England coast, after having spent a few months in European travel, finds himself wondering why, notwithstanding their unsurpassed natural beauty, the American places so often present a rather cold and lonely aspect to the eye. It is only after he has gone back and forth between Europe and America a number of times, and has begun to analyze his first impressions, that he discovers the cause of this American severity. It is poverty of color.

Nature is not to blame. Our skies are as blue, our sunsets as glorious, as any that the old world can reveal. Our vegetation is as rich in all the shades of green, from the pale olive gray of the Lombardy poplar to the dark hues of the hemlock and pine, as is the vegetation of the European Continent between Holland and the Austrian Tyrol. Possibly there is relatively a little more blue and a little less yellow in our sunlight than in Europe, which partly accounts for a warmer tone in the foreign landscape. It is the handiwork of man, however, that in our country is primarily at fault.

Skirting the southern coast of Devonshire or of the Isle of Wight on a clear summer morning, the American traveler enjoying his first view of English landscape is captivated by the soft harmony of delicate shades of green, of rich red-brown earth and of soft gray and brown colors on walls and roofs. Heading across to the coast of France, he views the red-tiled roofs and picturesque chimneys of Boulogne-Sur-Mer, presenting an exquisite picture in their setting of yellow sand dunes, of the blackening gray of the breakwater, and of the long green slopes of the fortifications. Voyaging on perhaps to the quaint old city of Rotterdam, he finds himself surrounded by a wealth of color such as he had never dreamed of. Perhaps nowhere else in the world are the possibilities of green, commingled with black and gray, so superbly realized. The mazes of shipping in the Maas offer an almost endless combination of these tints, and so do the walls and roofs of the houses along the banks of the canals. Journeying to Cologne the traveler finds there yet brighter colorings. On the principal residence streets of the newer quarters every conceivable tint of green, yellow and red, always excepting the raw primary shades, is seen in external house decoration, while the banks of flowers and shrubs in the little gardens and the endless array of flowers in window boxes combine in a glowing harmony that to the color-loving eye is fairly intoxicating. Taking the day boat on the Rhine for Coblenz or Mainz, one sees again in endless variety of river craft the coloring of Rotterdam. Combinations of bright with dull greens and black, with here and there a touch of red or yellow, give the dominant note to the whole.

So it is throughout Europe wherever one goes. On the Lake of Thun, at Lucerne, at Lugano, at Bellagio and Como, and above all at Venice, color everywhere of every hue, color without stint, but always softened, always harmonized in some prevailing tone, lends a warmth, a cheer, a life to every spot. It takes the susceptible American captive, and makes him wonder what it is that has been so utterly left out of his life hitherto.

Returning to his native land, what does he find? He steams up New York Harbor, the most magnificent deep water bay in the world, crowded everywhere with steam and sailing vessels, all of them hopelessly ugly in black and white, except the bizarre red ferryboats. He walks the streets of the city crowded with cars all in vivid yellow. He gazes overhead at cars all dingy red. He strolls past houses and public buildings in their vivid contrasts of glaring hues. Nowhere does he see harmony, nowhere any soft shadings, nowhere any artistic combination. Still, he sees that the existence of color has been discovered and he can cherish the hope that some day a portion of his yellow countrymen at least may learn how to use it properly.

But outside of New York City, the very existence of color seems almost to have been forgotten or never discovered. Here and there the summer cottages of the wealthy are covered in with soft-toned gray shingles or display a red chimney pot over the roof; but for the most part, American "resorts" are still congregations of glaring white or yellow clapboards. Sailing along the Maine coast or on inland lakes one never sees a red or yellow sail, and rarely a schooner of the old type, painted in harmonizing shades of black and green. The steamboats are glaring white monstrosities with black funnels. There is no reason in the world, outside of stupid human minds, why the waters of Casco Bay and of Frenchman's Bay should not be as bril-

liant with life and color as the waters of the Maas, or of the Adriatic. Indeed, the possibilities of these American waters are almost unrivaled. It needs only a color-loving people to make them as harmoniously beautiful as any dreamed of fairyland.

We shall have this color-loving people in America after a while. One of our most scholarly historians has said that American life is poor in beauty, because the colonizing movement selected from the old world the people that hated beauty—which was in their minds associated with Romanism—and left the beauty-loving people to perpetuate their kind in the older lands. The generalization may be too sweeping, but it is not altogether untrue. The present immigration movement is bringing to us the peoples of Southern Europe, including hundreds of thousands of the light-hearted, color-loving children of Italy. Let them come!

Love After Marriage

If love before marriage is an inspiration, as we remarked last week, it becomes a fine art afterward. The painter who imagines a beautiful picture is like the lover, happily filled with the prophecy of design. It is quite another thing to make the picture, and it is quite another proposition to be a husband, and to realize in life the anticipation of courtship days. Both, however, are possible. The artist must remain faithful to his ideal, and a tireless workman. There will be days of despair, nights of sickening disappointment; but the piety of art constrains him, an immortal love draws him again and again to the dear task. He is like a wrestling Jacob determined to reveal the spirit of his thought in color and symmetry. No wonder the picture surpasses his original, lover inspiration. Now, marriage is such a masterpiece of love as this. It is the canvas upon which we test the genuineness of lover inspiration. If the result is unsightly, it is because the married ones have failed of fidelity, not so often to one another as to the ideal upon which marriage is based. But if they are as wise as serpents in dealing with one another, and as harmless as doves, if they have the wit to touch with light the dark lines in the character of each, marriage becomes the one perfect demonstration of love. It is a charming, dramatic commerce in human nature, containing all the elements of interest, gravity, humor, pathos; all the lights of love, from the white altar place to the merry fireside; from the shekinahed cradle to the faded rose in the life-giving woman's cheek. So far from being a "cure" for love, it is love developed in a myriad more forms than to courtship is possible.

The fact remains, however, that many marriages are partial or total failures. This is because husbands and wives do not recognize the necessary change from inspiration to art in the development of love. They are like two fools, who have "staked a claim," without having the energy or wit to work it. This is why so often an adventurer or adventuress works it for them. The wife meets another man who "understands" her, and the husband finds a poppy-lipped woman who "appreciates" him. The original sin consisted in not appreciating and understanding one another. But many married people think they understand one another when they have discovered every fault and limitation each of them has. This is the comprehension of enemies, not of people who love. The higher criticism of love consists mainly in discovering, holding fast to one another's virtues and attractions.

The chief trouble with many is that they *die* to one another after marriage. The wife forgets to practice the cunning of her maidenhood, just as she gives up her music and other pretty accomplishments. And while the husband may not know in what the death consists, he misses both the cunning and the music. The wife who imagines that there is virtue in such self-effacement has not sufficiently studied her problem. She is foolish, improvident in that she surrenders only the mechanical, serving, slave side of her nature. If she expects to receive a good lover's interest upon her capital she must give all she is capable of being. She must not discard a single coquettish grace, nor by any means that peculiar gift women have of saying pretty things. If she must work, let her serve gayly. It is not drudgery that makes her unattractive, it is the way she abandons herself to the scrubbing-brush side

of life. The mind and spirit have power over all conditions and environment, else we should still be aboriginals with no marital or other virtuous ideals. Even in sickness, unless the brain is actually affected, hysteria and melancholia are inexcusable; and they blight the matrimonial atmosphere almost as much as some of the grosser vices like drunkenness.

Another thing, virtue is not the sort of self-abnegation some women think it is, but it is the manner of self-assertion. Not recognizing this fact leads the wife often to forget other men. This is a mistake the most virtuous married man never commits. He cannot. From adolescence to old age he has a seeing power for femininity that never fails, a gallant intuition that takes cognizance of her presence, and there is at least a rude grace in its effect upon his character. It prevents his being an everlasting savage, for one thing. Many married women, on the other hand, lose the legitimate sense of sex. They have a false notion of propriety which forbids this natural and innocent expression of personality. They deliberately sacrifice the beautiful charm of being sweetly, eternally different from men. Their vitality is no longer mystical, esoteric, but their whole stupid, uninspired mind is revealed. They have, indeed, ceased to be feminine in any sense save a perfunctory and domestic sense. In assuming this married-nun relation to life they do escape the notice of all men, especially of their own husbands. A man may have an affection and a sense of obligation to his wife, but he will not find her attractive unless such she really is. And a woman who is attractive to her own husband is by the same law admired by other men. But where does the fault lie in that? The truth is, whatever may be said of young and old bachelor maids, it is the chief duty of all wives to make themselves good, patient, wise and adorable. No amount of public piety, social or intellectual distinction or settlement working energy will atone for her deficiencies in this ethic of the married life.

If we purposely ignore the husband's obligations in the marital state, it is not because he has none, but because a rude sort of temperamental incomprehension renders him so often incapable of meeting them. Every intelligent married woman faces this fact graciously and forgives him. He is simply the raw material out of which she achieves a family and happiness. She prefers his invincible ignorance about many matters, if she is clever, to being married to an abnormal, sensitized man, who weakens all her frailties by understanding and sympathizing with them. Such a husband develops hysteria in the wife, as a rule, which he can no more cure than whisky cures drunkenness. The perfect husband does not exist, indeed, because there is no demand for him. No woman asks it, since being a perfect husband is not primarily a man's business in the world. He would be a sort of matrimonial prig whom wives would find tiresome. Innumerable ills would follow his advent,—not the least being the loss of the sense of superiority, which all wives have secretly, and which is really essential to their consciousness. They endure the hardships of the married life cheerfully from this basis. To deprive them of it would be like bereaving them of the feminine power of condescension, which is one of their dearest attributes.

The conclusion of the whole matter, then, is that romantic love does survive marriage, but that the fine art of it depends upon the wife more than upon the husband.

Mr. Bryan's Pronunciamento

In *The Commoner* of last week Mr. Bryan puts himself forward to undertake "the work of organizing the radical and progressive element in the Democratic party." What he proposes looks very much like splitting the Democratic party and organizing a new party. He does not expect to have behind him the majority of the party as it now is. Indeed, he makes no secret of the fact that he puts no trust in Mr. Parker or his supporters. He feels himself commissioned to be the leader who will give the party new issues and completely reorganize it on a new platform.

And we must admit that the platform he presents has its real merits. In the first place, he is forced to acknowledge that the silver issue is for the present dead, and he does not propose to reopen

it except as his enemies, the wicked Republicans, shall unmask their purposes and try to withdraw greenbacks and substitute for them bank notes, and establish a great central United States Bank and branch banks. Then he will rush again to the defense of the people against the forays of the money power in Wall Street.

The great measure which Mr. Bryan now proposes to bring forward, and on which he will rally the radical and progressive element of the Democratic party, is the public ownership of the railroads, trolley lines, telegraphs and lighting plants of the country. The telegraphs (and, we suppose, telephones) he would have owned by the National Government, the railroads by the several States, the trolleys and gas and electric lighting plants by the municipalities. It is the destruction of monopolies that he is after, and the overthrow of the trusts. Further, he wants an income tax, the election of federal judges for limited terms, and the popular selection of postmasters. Scarce a reference does he make to imperialism or the tariff. Mr. Bryan's main points are what we have in good measure favored. They are no more Democratic than Republican measures. We suppose a great many more Republican municipalities than Democratic own their lighting plants. It is Republican Postmaster-Generals that have urged the expansion of the Post Office system to take in the telegraphs and a good part of the express companies' service. The selection of postmasters by the people we have no will to oppose.

His chief emphasis Mr. Bryan puts on public ownership of railroads, and he opposes national ownership and proposes State ownership. He is afraid of national ownership as affording too great a field for political corruption. Is he sure there would be less of it in the legislatures of forty-five, or forty-eight, States than there would be in one national Congress? At present is there more corruption in our immense Post Office Department than there is in State capitals? We believe that national ownership would be very much freer from taint of corruption than ownership by a multitude of States. Further, there would be much less chance of friction, and the likelihood of harmonious operation of lines would be much greater. Such national ownership we desire, but we are more radical and more trustful of the people than is Mr. Bryan; we would give the ownership and control to the Nation, not to the States.

Nor do we object to an income tax. It is the fairest of all taxes, but the serious difficulty about an income tax law is in its operation. Such a tax makes more trouble in its execution than any other. If all rich men, and men of moderate means, were honest and would tell truly what their income had been, it would go smoothly; but men do not like to tell just what income they have, and a great deal of prying would be necessary that the taxes might be correctly assessed. The enactment of an income tax law is probably as far off as the enactment of a law to purchase our railroads.

The election of federal judges is a different matter. He would have them "elected for a limited term," and not created by executive appointment; for, says he, "election for a stated period would bring the judiciary into closer touch with the people, whose servants the judges are." But this is precisely what the judges are not, or should not be. Their business is not to be servants of the people, but to judge justly and intelligently between man and man. Our federal judges who are appointed to office which they hold for life are as a whole a much abler set of men than our State judges who are elected by the people for a term of years, altho the pay of the State judges is often two or three times that of the federal judges. Whatever the theory may be in practice, a judiciary appointed for life brings the best results.

There are two other political questions before the country, but neither of them yet ready to crystallize into a political issue. One of these is the labor problems, and the other the negro question. Both of these Mr. Bryan touches in a gingerly way. He has nothing but platitudes to utter on the one—he is the friend of labor and of "honestly acquired wealth;" as to the other, he says that the election of Mr. Parker will rid us of "the threat of a race issue," even as the selection of postmasters by the people "would make it impossible to force colored postmasters upon white

communities." This is all he has to give upon this topic, and it is enough to show us how little regard he has for the rights of the dear common people, when they are black, and yet he declares that "the Democratic party must devote itself to the protection of human rights;" but the human rights that are most denied and refused are the rights of those for whom he cares nothing.

That Mr. Bryan will have any speedy success in making himself the leader, within his party or out of it, of such a radical wing as he summons, we have little expectation. The charmer has ceased to charm.

Diphtheria Antitoxin

THERE are many who are still dubious with regard to the efficaciousness of diphtheria serum to lessen the mortality from the dread disease, and as a consequence are distrustful of other modern medical methods. Those whose interest in the matter is sincere should read the statistics given in the latest report of the Commissioner of Health of Chicago, which has for its subject the comparative mortality in diphtheria before and after the introduction of the antitoxin treatment into the city of Chicago. These statistics are all the more deserving of confidence because they do not come from doctors at random, but are the definite reports of the regularly appointed administrators of the health department of the city.

The first dose of diphtheria antitoxin administered was on October 5th, 1895. Since that time 7,435 cases of diphtheria, the diagnosis of the disease having been verified by special bacteriological examination in every case, have been thus treated. Of these 479 died, a mortality rate of not quite 6½ per cent. According to the records of the Department of Health of the city the average mortality without antitoxin is still what it was before the introduction of antitoxin—that is, about 35 per cent. Some idea of the saving of life that has been thus effected can be gathered from other data furnished in the report. Before the administration of antitoxin there were over 12 deaths every year from diphtheria for every 10,000 of population; since antitoxin has been introduced there have been less than 5 deaths for 10,000 of population. When antitoxin was introduced Chicago had a population of 1,200,000 approximately; at the present time the population amounts to 1,672,000. During these years of the use of antitoxin the population has increased by 52 per cent., and at the same time the actual decrease of deaths from diphtheria has been over 63 per cent.

The most interesting lesson of the Chicago report, however, is contained in the statistics with regard to the higher mortality when antitoxin is not administered early in the cases. Of the total, nearly 7,500, cases that were treated by the Department of Health physicians, about 600 were treated on the first day of the disease and only two deaths occurred among these cases, the mortality rate being scarcely more than ⅓ of 1 per cent. Nearly 2,000 cases were treated on the second day, and of these 28 died, a mortality rate of about 1½ per cent. Over 2,500 cases were treated on the third day and 85 died, a mortality rate of nearly 3¼ per cent. About 1,400 cases were treated on the fourth day; 148 of them died, a mortality rate of nearly 11 per cent. Nearly 1,000 cases were not treated until the fourth day, and of these 216 died, over 23 per cent. The importance, then, of having antitoxin administered as early as possible in the cases is emphasized by this report, and the necessity of allowing the physician a free hand in the matter, so that he may prevent the ravages of the disease by counteracting the toxins formed in the system, constitutes an almost infallible means for securing the recovery of the patient after only a slight illness.

Unfortunately, those who are still opposed to the diphtheria antitoxin have so affected the minds of those with whom they are in contact that there is often some hesitation in allowing the physician to employ antitoxin at the early stage of the disease, when it is most effective, but when there are often very few, if any, symptoms of an alarming nature present. There can no longer be any doubt about the absolute innocuousness of diphtheria antitoxin itself. It has now been given in millions of cases, and while some deaths have been reported, it is now well recognized that they are due to

some complication or accident and never to the antitoxin itself, and in recent years, tho the number of injections has grown enormously, such reports have practically ceased. This great humanitarian remedy, then, must be allowed to exert its full therapeutic action as early as possible in the cases.

A Blow to Convict Camps

JUDGE EMORY SPEER, sitting in the District Court of the Southern District of Georgia, has had occasion to deliver some very important opinions, and none clearer or more important than that lately delivered as to the right of a police magistrate to sentence those guilty of a petty municipal offense to the chain-gang.

The case was one of habeas corpus demanded in behalf of Henry Jamison, sentenced by the Recorder of Macon to seven months' hard labor in the public chain-gang. Jamison was a poor day laborer, whether white or black makes no difference. He was arrested twice the same day on the charge that he was drunk and disorderly, and was sentenced on two counts to an aggregate fine of sixty dollars or seven months in the county chain-gang. The right to the services of this chain-gang has been sold by the city of Macon for $8,000. Of course, Jamison was unable to pay the sixty dollars, and to the chain-gang he had to go. But he had friends who were determined to test the legality of the sentence, such a sentence as has maintained the chain-gang and has enriched the Macon treasury, much to the indignation of a number of the citizens of Georgia who are trying to break up the system of chain-gangs and convict camps; and the case was brought before the United States Court and Judge Speer.

The case depends on the right of a petty municipal judge to sentence a man, without trial by jury, to an infamous punishment. Judge Speer decides that the chain-gang is such an infamous punishment as, under the Constitution of the United States, requires trial by jury for its infliction. His argument is mainly devoted to the proof that it is an infamous punishment. He quotes abundant decisions that imprisonment at hard labor is "infamous." The prisoners in the chain-gang wear the striped clothing of the penitentiary. They have iron manacles riveted on their legs that can be removed only with the chisel. They have to sleep in their clothes. Their manacles are on them night and day. They work thus on the public roads before the public eye. Convict guards watch them with rifle and shotgun. There is a whipping boss with his whip, a heavy leathern strap two and a half to three feet long, and it is freely used if the gang does not work "like fighting fire." A case was testified to in which a white boy (but that makes no difference) with one arm was compelled to put his head between the legs of a big negro and immovably held while lashed. The offense for which the boy had been sentenced was "loitering in the depot." Other offenses were "disorderly conduct," riding a bicycle too fast, standing on the park grass, loitering in the railroad yard, and careless driving. For such offenses men and boys are sent to the chain-gang for months and lashed if they do not work hard enough to satisfy the whipping boss.

The evidence is plain that such punishment is "infamous," and can only be inflicted constitutionally after trial by jury. Doubtless hundreds and thousands have thus been illegally punished for minor or trivial offenses. This decision, which liberated Henry Jamison, is an exceedingly important one, and we wish it might break up the system of punishment for petty offenses in certain States, where the object sometimes seems to be less the maintenance of public order than the supply, at the expense of the poorest people, of a source of income to the towns or the State. But the system, infamous as it is, will die hard.

Popular Universities in France

A VERY interesting educational movement has developed among the French socialists almost unknown to the world in general. In form the *Universités populaires* are much like the lyceums which used to be so popular in this country, and they differ from the University Extension circles in that they are more

independent and spontaneous, and have no official relation with the colleges, altho many of the lecturers are professors who do this work for little or no pay. There are many such circles in Paris and some other cities, each supported largely by the workingmen and others of the vicinity who attend; and in a few instances the lecture room has developed into a club house with social rooms, co-operative restaurants and cheap and hygienic lodgings. It is interesting to read over the topics as announced every day in the socialist papers. Some are scientific and experimental, such as those on "Radium," "Liquid Air" and "The Evolution of the Human Type;" some practical, like "The Fight Against Tuberculosis," "Food Adulterations" and courses in stenography, hygiene and "The Rights and Duties of Parents." Lantern lectures seem to be as popular as everywhere else, for such titles as "Modern Japan," "Madagascar," the "St. Louis Exposition," the "History of Paris" and "Revolutionary Caricaturists" often appear. Art is not neglected, and readings and criticisms of the most important work in French and foreign literature are common. Concerts, singing and dancing classes and rehearsals and presentations of socialistic dramas and choruses alternate with the lectures.

The favorite subjects for addresses and discussions are, of course, sociological, of which a few titles will show the scope: "Social Questions in the Plural and in the Singular," Hauptman's "Weavers," "Saint-Simon and His Doctrine," "Wells's Anticipations," "The Condition of the Working Classes in the United States," "Economic History of the Revolution," "The English Colonial Empire," "Suicide," "The Woman's Rights Movement," "Lombroso's Opinion of Anarchists," "Lying," "Christian Socialism versus Lay Socialism." Debates and discussions are very popular. One night there will be a *Causerie amicale* and the next a *Conference contradictoire;* no doubt a very different thing, altho we have known the one to change into the other spontaneously. One ambitious club settled the question of the existence of God by the simple method of chalking down the affirmative arguments on one half the blackboard and the negative arguments on the other, and canceling them; but, unfortunately for an anxious world, it is not stated on which side the balance remained.

Most of these "popular universities" have adopted names more or less emblematical or enigmatical, such as *Fraternelle, Soirées ouvrière, Zola, X, Humanité, Aube sociale, L'Effort, Foyer du Peuple, Co-opération des Idées.* This last seems to have been an unfortunate selection, for the ideas failed to co-operate. The founder and chief supporter discovered that the club was trending toward anarchistic opinions very different from what he had intended, so in the very natural but fallacious belief that he could control what he had created he closed it up. The members, however, resented this unceremonious dissolution, and the matter had to be settled by the courts.

Dog Telepathy

It is a new wrinkle in telepathy which H. Rider Haggard has favored us with, about as surprising as anything in "She." We trust it is not one of those fabrications which writers have sometimes delighted to fool the world with. He says he had a painful nightmare, and while still in a half-unconscious state dreamed that his favorite dog was dying, that he was himself close to it, and that the dog was endeavoring to tell him the facts. Three days afterward the body of the dog was found in the river, the dog having been killed by a train. Mr. Haggard believes that the dog when dying, or soon after, tried to tell his master and really succeeded. It is not clear, however, that the dog was not killed three hours after the dream, and the value of the evidence for dog telepathy depends on the exact hour of the dream and of the death, as it would be a mere case of accidental coincidence, the dream happening to turn out true, if the dream came first. We do not wonder that the English papers find in this a fruitful subject for discussion, but we fear that it will give rise to a series of telepathic incidents along this new line, which has great possibilities. May we not hear from the Society of Psychical Research? Will Professor James, whose

late book on religious experience was so largely an argument for spiritism, find here an evidence that animals have souls? Mr. Haggard thinks the dog died first and that its spirit communicated with its master.

Holy Curios

There was a time when the best that pious reform knew what to do was to burn idols or books of magic. Now, we do better; we put the books in libraries, and publish them as a source for the history of religion or language. Just now the British Museum has published a second volume by one of its young scholars, Mr. Thompson, wholly devoted to preserving just such magical formulæ as were burnt, to the value of over $8,000, at Ephesus as the result of St. Paul's preaching there two years. As to idols, we put them in missionary museums, or museums of religion, like that of the University of Pennsylvania. What a magnificent collection of idols may be made one day when the miraculous images of Greek and Roman Christianity shall cease to be objects of adoration! Take, for example, that silver image of the Virgin Mary at Antipolo, in the Philippines. It is of solid silver, five feet two inches high, and it was dropped down from heaven, so they say, over three hundred years ago. It has been endowed, after the usual pagan fashion, with immense wealth of land and jewels; and multitudes visit it from all the islands at the annual *fiesta*. It would be a great treasure in any museum; but that we can say of many other sacred images and relics in Europe and America. That Holy Grail, of "emerald" (green glass), has been made the pledge for the loan of a kingdom's ransom.

Ethnology and Time

"Ethnologically speaking, a few centuries is but a short time," so says an American writer discussing one of the so-called "burning questions" of the day. That depends. If one is discussing matters of physical structure and heredity, such as the shape of the skull or the color of the hair in a race, that is true; but if it has to do with matters of education, culture, character, matters which depend not on physical, but on social heredity, it is not true. The most tremendous, overpowering evidence on this subject is supplied by the Japanese. They represent a yellow race, Mongolian, possibly with a dash of Malay blood. Fifty years ago they were asleep, utterly unawakened to the Western spirit. They were wedded to their own long inherited traditions and prejudices, and were despised by the Chinese even, who represented a somewhat wider outlook on the world. All of a sudden, as by a flash from Heaven, light was let into the darkness, and the people, by the superb and most unexpected energy and good sense of their rulers, reversed their ideals and resolved to transform their thought and methods. They eagerly sought the Western civilization and science, and they found it in a generation. A Japanese does not now think or feel as his father felt and thought, but exactly as we do in the West. It did not take "a few centuries" to do the work; it was done in half a man's lifetime. Japan was able to provide swiftly the necessary social heredity of teaching. Japan put itself consciously at school, under tutelage. What Japan did can be done by the yellow race in China, and we believe will be done in good measure within a generation. It can be done by any race, if the conditions are made favorable. Our duty is to make the conditions just as favorable as possible, to help every race, just as we helped the Japanese by our missionaries and teachers sent to them, and by the instruction we gave to their youth here. When President Jordan, of Stanford University, visited Japan he found everywhere men who had been educated at Harvard, Yale, Cornell, Michigan, Stanford and California universities. It is criminal to excuse ourselves by talking about centuries when we ought to look for rapid change of character and habits.

Discoveries in the East

The Royal Academy of Science in Vienna has just published a report of the Austrian excavations in the buried mound of Taanak, one of the biblical cities of Southern Palestine, which

was an important center before the Hebrews came out of Egypt. Of all the objects found the most important are four cuneiform tablets, of which two are letters to Istar-wasur, King of Taanak. The most interesting thing about them is the name of one of the correspondents of the King, which Dr. Hrozny reads *Ahi-yawi*, which would seem to include, at this very early time, the name of *Yahveh*, or Jehovah, and to mean the same as *Ahijah, Jehovah, my brother.* It will be remembered that in Professor Delitzsch's famous lecture before the Emperor William, which gave rise to the "Babel and Bible" controversy, one of his special points was that the name of the Hebrew God appeared as an element in Babylonian proper names. In this connection we may mention that reports received from Dr. Banks, who is opening the mound of Bismya (or Bismêyeh), in Southern Babylonia, for the University of Chicago, seem to show that it is the ancient city of Adab (or Ud-nun-ki), of which little is known, except that it was a very ancient site, and is mentioned in the Code of Hammurabi, who says (column iii, line 67) that he "gave life to Adab," and was "benefactor of its temple E-mah." It has been conjectured hitherto that Bismya is the site of the ancient city of Isin, but Hammurabi mentions Isin as a different locality. Dr. Banks has found bricks at a low level in Bismya with the name "Ud-nun-ki." There is every prospect of valuable discoveries. One great drawback has been removed in the finding of good water on digging wells.

Chinese Students in America

That China is waking up is past all question. One sign of it is the revival of the imperial policy which sent boys of promise to this country thirty years ago for education. Those boys are now in leading positions, one of them now the Chinese Minister at Washington, as was his predecessor. The examination of the boy-candidates to be sent abroad again this year was lately held in Canton. There were 560 applications, and over 500 actually appeared for examination. They were examined in translating from Chinese into English, French, German or Japanese, and then from the language chosen back into Chinese. One group of them were examined in arithmetic, algebra, geometry and trigonometry, and all in Chinese composition. From the whole number 26 were chosen, and others will raise the number sent from Canton to 40, half of whom will come to the United States, and the rest go to Europe. Not less than 30,000 Chinese students are now being taught by foreigners, most of them in missionary institutions, while a thousand Chinese youth are in schools in Japan, and a multitude of Japanese teachers are in the Chinese civil and military colleges, and the normal and agricultural schools that have been established now in every province in China. All this suggests that it is a matter of the highest importance that the missionary colleges and schools in China should have ample equipment and the most competent teachers.

Of course, the officer of the Long Island township who fired three shots last week at the fleeting occupants of an automobile is to be severely condemned on all moral and legal grounds. Still his remedy caused the automobile to stop, and that is more than all the $10 fines imposed by judges and magistrates have been able to do in the past. As we have said before, the only just and efficacious way to deal with these rich lawbreakers is to imprison them for a few days. That will bring about the repentence which begets reform.

While Mrs. Stanford serenely purchases for over $100,000 an extraordinarily fine collection of Japanese works of art for the university that bears her son's name, from two Japanese noblemen, who sacrificed their heirlooms to supply money for the war with Russia, Mrs. Hearst has been obliged to reduce her support of her university and curtail her generous grants to charity. It is said she finds candidating for the Presidency an expensive pleasure.

Insurance

Electrical Fires

Some interesting facts regarding electrical fires appear in the recently issued quarterly report of the Electrical Bureau of the National Board. Thirty fires are reported as due to crosses of telephone, telegraph, signal and other wires with high and low potential circuits. The same number of fires originated because of the grounding of circuits. In eleven such cases gas pipes figured, and in nine of these the pipes were punctured and the gas was electrically ignited. Eighteen fires took place in electric cars, of which six were caused by resistance coils. Seven electrical fires occurred in show windows. Eight fires were caused by short circuits in flexible cords. Seven fires were due to the grounding of circuits in damp moldings. Open link fuses were the moving causes in five cases. Half a dozen fires were due to loose connections in switches, arc lamp terminals, etc. There were three fires in moving picture machines and four fires were due to the fact that electric pressing irons were left with the current turned on. The largest damage reported as probably due to an electrical fire was over $3,000,000 in amount. Electricity it would seem is rapidly coming to the front as a fire hazard.

The Hartford Steam Boiler Inspection & Insurance Company

Lyman B. Brainerd has recently been elected President of the Hartford Steam Boiler Inspection & Insurance Company to succeed the late J. M. Allen. Mr. Brainerd came to the company from New York, March 2d, 1894, where he held the position of manager of the bond department of the Equitable Mortgage Company, and was made assistant treasurer of the Hartford Steam Boiler Inspection & Insurance Company. Five years ago he became treasurer of the company, and will retain this office with the presidency. Mr. Brainerd is a director in the Case, Lockwood & Brainerd Company, a director of the Security Company, a trustee of the Society for Savings, all Hartford institutions, and is also a trustee of the Hartford Theological Seminary and chairman of its Executive Committee. Mr. Brainerd was born in Colchester, Conn., March 27th, 1856. He received his education at Willbraham Academy. His first business experience was a canvasser for the State Mutual Fire of Hartford. He afterward entered the employ of the Jersey City Fire Insurance Company as general agent and adjuster, and remained with this company for eight years. Mr. Brainerd is a son-in-law of the late ex-Mayor Leverett Brainard, of Hartford, and is identified largely with the financial and educational interests of Hartford. The other officers of the company are: Francis B. Allen, Vice-President; Joseph B. Pierce, Secretary, and Louis F. Middlebrook, Assistant Secretary. The directors are Colonel Frank W. Cheney, Charles M. Beach, Judge Nathaniel Shipman, Carlos C. Kimball, George A. Fairfield, Joseph B. Pierce, Atwood Collins, Lucius F. Robinson, Lyman B. Brainerd, Morgan B. Brainard and Francis B. Allen. In 1866 the Hartford Steam Boiler Inspection & Insurance Company was incorporated, and has been in successful operation ever since.

Darwin P. Kingsley, Vice-President of the New York Life Insurance Company, delivered on July 6th at Burlington, Vt., the oration on the occasion of the one hundredth commencement of the University of Vermont. The oration, which is exceedingly interesting, has been published in pamphlet form.

....A large number of costly fire extinguishers and hundreds if not thousands of fire pails are destroyed annually by representatives of the insurance patrol. They cease to have value as fire apparatus for the reason that they have all been rendered worthless by neglect. The acids which enter into the constituency of most of the patent extinguishers eat away the tin coverings and make the destruction of the apparatus a necessity, because it becomes a peril in itself if still further neglected. The fire buckets, which ought to be emptied and refilled at least once a week, are filled upon installation, but not systematically after that, simply rust out in the course of time and become useless.

Financial

Steam and Trolley

Two great Eastern railway systems—the New York Central and the New York, New Haven & Hartford—whose local and suburban passenger traffic has been seriously affected by trolley competition, have recently set out to obtain control of the situation by getting possession of the trolley roads that have been reducing their income. The effect of this movement will be far-reaching, and the companies' officers themselves do not profess to foresee what it will be. In the interior of New York State, the Central has very recently purchased, directly or indirectly, control of the Syracuse electric system and of the company operating electric roads in Utica, Rome and Oneida. The Central has two parallel main lines. Its purpose appears to be to use one of these (the West Shore) for connecting its several urban trolley systems along the line between Albany and Buffalo. The West Shore, it is said, will be "electrified" between Utica and Syracuse, and possibly as far westward as Rochester. Thus, for local and interurban passengers the advantages of a main trunk line may be combined with those of the trolley feeders. Evidently, the steam company's motives are to prevent or control the competition of existing trolleys, and to prevent the threatened competition of long trolley lines already projected, but not yet built, such as the projected road from Rochester eastward. Its intended use of electric power on the West Shore tracks, together with the coming use of such power exclusively at the New York terminal and within 30 miles of it, may lead to the substitution of electricity for steam on the entire line from New York to Buffalo.

The New York & New Haven Company began some years ago to defend itself against the trolleys by purchasing the trolley roads at Stamford and using electric power (by third rail) between Hartford and New Britain. Some months ago it bought the New Haven city system, with its important suburban branches. Last week it obtained possession of the trolley systems at New London and Norwich, and it controls trolley lines extending southward and eastward from Worcester. Already it has the situation well in hand, so far as possible long interurban trolleys in the region between Boston and New York are concerned. It is cheaper to control by purchase than to fight by cutting rates. How those who have used the trolleys will be affected by the change remains to be seen. In some places they may gain something by the consolidation, if the steam company gives them—and this will be feasible in Central New York—the advantages of swift interurban transit, without change, in connection with the elasticity and convenience of an urban and suburban street railway.

*

ACCORDING to a recent official report, 39 per cent. of the persons employed in gainful occupations in the United States are engaged in agriculture.

....The prosperity of Southern cotton mills is shown by recent declarations of dividends by a dozen companies, ranging from 6 to 17 per cent. per annum. One mill in North Carolina earned 35 per cent.

....Exports of fruit from this country have increased from less than $3,000,000 in 1894 and less than $8,000,000 in 1899 to more than $20,000,000 in 1904, when the value of the apples sold to foreign buyers was $8,500,000. The shipments of prunes amounted to $3,500,000.

....William H. Leupp has been elected President of the Trust Company of America, in place of Ashbel P. Fitch, deceased. Mr. Leupp was with the Bank of New York and then connected himself with the Farmers Loan & Trust Company, where he remained for twenty years, or until 1899, when he resigned the vice-presidency to accept the same office in the Trust Company of America. The other officers of the Trust Company of America are Henry S. Manning, Vice-President; Raymond J. Chatry, Secretary, and Albert L. Banister, Treasurer. The company has a capital of $1,000,000; its surplus is $2,500,000, and its undivided profits are $644,565.

The Independent

Vol. LVII NEW YORK, THURSDAY, AUGUST 4, 1904 No. 2905

Survey of the World

Mr. Roosevelt's Speech of Acceptance

Formal notice of his nomination was given to President Roosevelt at his country home on the 27th ult. by Speaker Cannon, chairman of the Republican convention, and the committee appointed for that purpose. The ceremony on the lawn at Sagamore Hill was a simple one. In a long address, Mr. Cannon pointed with pride to the achievements of his party, criticised his political opponents, and commended the President:

"The Republican party under your leadership keeps its record from the beginning under Lincoln of *doing things*—the right things at the right time and in the right way, notwithstanding the opposition of those who oppose the right policies from the selfish or partisan standpoint. They dare not tell the truth about your official action or the record of the party and then condemn it."

At the beginning of his reply Mr. Roosevelt gave notice of his purpose to send to Mr. Cannon hereafter "a formal written acceptance, more at length and in detail." "We who have been entrusted with power during the past seven years," said he, "now come before the people content to be judged by our record of achievement. If continued in power we shall unswervingly follow out the great lines of public policy which the Republican party has already laid down:"

"We are more fortunate than our opponents, who now appeal for confidence on the ground, which some express and some seek to have confidentially understood, that if triumphant they may be trusted to prove false to every principle which in the last eight years they have laid down as vital, and to leave undisturbed those very acts of the Administration because of which they ask that the Administration itself be driven from power."

On the other hand, he continued, the Republicans were not constrained to keep silent on any vital question, they were divided on no vital question, and their policy was continuous. Concerning Trusts, they did not have to explain why the laws were not enforced, but could point out that they actually had been enforced. They had shown a determination to turn rascals out. They had placed the finances of the nation upon a sound gold basis, "against the violent opposition of the mass of our present opponents who still refuse to recant the unsound opinions which for the moment they think it inexpedient to assert:"

"So long as the Republican party is in power the gold standard is settled, not as a matter of temporary political expediency, not because of shifting conditions in the production of gold in certain mining centers, but in accordance with what we regard as the fundamental principles of national morality and wsidom."

When a readjustment of the tariff was needed it should be made, but by the friends of protection. Wages were "higher than ever before," and the wage workers' high standard of living could not be maintained unless the tariff, as a minimum, should "cover the difference between the labor cost here and abroad." The Republicans believed in "reciprocity with foreign nations on the terms outlined in President McKinley's last speech." They would do fair and equal justice to all men, without regard to race, creed, or

birthplace. They would favor both the organization of capital and the organization of labor, so long as these acted in a spirit of justice and of regard for the rights of others. Concerning the Isthmian Canal, he said:

"We conducted the negotiations for its construction with the nicest and most scrupulous honor, and in a spirit of the largest generosity toward those through whose territory it was to run. Every sinister effort which could be devised by the spirit of faction or the spirit of self-interest was made in order to defeat the treaty with Panama and thereby prevent the consummation of this work. The construction of the canal is now an assured fact; but most certainly it is unwise to entrust the carrying out of so momentous a policy to those who have endeavored to defeat the whole undertaking."

Our steady growth in power had gone hand in hand with a strengthening disposition to use this power with strict regard for the rights of others and for the cause of international justice and good will. We publish elsewhere a part of the President's remarks about the Philippines. After speaking of the Administration's purpose to increase the Filipinos' share in the insular government, he said:

"To have gone faster than we have already gone in giving the islanders a constantly increasing measure of self-government would have been disastrous. At the present moment to give political independence to the islands would result in the immediate loss of civil rights, personal liberty and public order as regards the mass of the Filipinos, for the majority of the islanders have been given these great boons by us, and only keep them because we vigilantly safeguard and guarantee them. To withdraw our Government from the islands at this time would mean to the average native the loss of his barely won civil freedom."

"We are striving," said Mr. Roosevelt in conclusion, "to do our work in the spirit with which Lincoln approached his:"

"During the seven years that have just passed there is no duty, domestic or foreign, which we have shirked; no necessary task which we have feared to undertake, or which we have not performed with reasonable efficiency. We have never pleaded impotence. We have never sought refuge in criticism and complaint instead of action. We face the future with our past and our present as guarantors of our promises, and we are content to stand or to fall by the record which we have made and are making."

Other Political Events

By unanimous vote, Thomas Taggart, of Indiana, has been elected chairman of the Democratic National Committee. Mr. Taggart was born in Ireland. Beginning his life work in Indianapolis as an employee in a restaurant at the railroad station, he made his way upward and was for three terms Mayor of the city. As a political manager he has been very successful. For eight years before he became Mayor he was auditor of the county in which Indianapolis is situated, an office which is said to have yielded $50,000 a year in fees. At the present time he is landlord of a hotel at French Lick Springs, and it has been charged that he is the responsible proprietor of a well-known gambling house there. Altho he is president of the hotel company, he denies that he has any connection with the gambling house, asserting that it is leased to other persons by the railroad company that owns the entire property. His election to the chairmanship is not satisfactory to certain prominent Gold Democratic papers in New York, one of which regards it as "a matter of disappointment and regret that a man of greater ability, better training and larger experience could not have been found," while another remarks that he "is plainly of a much coarser grain and poorer quality" than Mr. Cortelyou, and that "his selection will not strengthen the party with those men of influence who think and vote independently." Mr. James Creelman publishes the following letter received by him in June from Judge Parker in reply to one sent to the latter in behalf of the New York *World:*

"ALBANY, June 17th, 1904.

"You may be right in thinking that an expression of my views is necessary to secure the nomination. If so, let the nomination go. I took the position that I have maintained—first, because I deemed it my duty to the court; second, because I do not think the nomination for such an office should be sought. I still believe that I am right, and therefore expect to remain stedfast. Very truly yours,

"ALTON B. PARKER."

It is announced that Judge Parker will remain at Rosemount until the election, and will make no speeches elsewhere. The date of his resignation has not been fixed, it is now said, owing to his engagements with respect to court cases which are not to be decided finally until October. The press points out that if his resignation should be later than August 8th, he could be a candidate for the same office at the election in 1905, while he could not then be a candidate if he should resign before that date. Mr. Murphy, the Tammany leader, has called upon him, and appears now to be perfectly satisfied with his nomination. Large photographs have been published, showing Judge Parker, Mr. Murphy, ex-Senator Hill and Chairman Taggart standing in a row, their smiling faces indicating harmony. Mr. Hill's first visit to the Judge since the convention was made last week. Mr. Bryan says he intends to make no political speeches in the campaign, except in support of personal friends nominated for Congress in Missouri. He has declined to make an address at the Democratic picnic in Chicago on the 20th inst. Considerable space is given in the press to a statement in support of Judge Parker from John E. Parsons, a prominent lawyer, who became widely known some years ago as the author of the agreement upon which the Sugar Trust was founded.—The Republicans of Missouri, at their convention on the 27th ult., nominated for Governor Cyrus P. Walbridge, ex-Mayor of St. Louis, on a platform declaring that the eradication of bribery in public life was the paramount issue before the people of the State. It is reported that two candidates for the chairmanship of the State Committee withdrew because, as they said, they had reason to believe that an influential element in the party had entered into an alliance with the Democratic machine to defeat Mr. Folk.—Ex-Senator George Turner, a candidate for the Vice-Presidential nomination at St. Louis, will probably be nominated for Governor in Washington, upon a platform calling for a railroad commission and a tax commission. On this issue there is a division in the Republican party of the State.—John A. Benson, a millionaire indicted at Washington, D. C., some months ago for conspiracy and fraud in connection with public lands, was discharged in New York, last week, by Judge Lacombe, who said that the indictment was obscure and involved and did not tend to show a conspiracy to defraud the United States.

Strike of the Beef Workers

At the beginning of the present week there were some signs that the strike of the beef workers would soon fail, unless supported by sympathetic strikes in other industries. The packers in Chicago asserted that they had nearly 14,000 men at work, and that 2,580 of them were deserters from the unions. They appeared to be producing at least half of their normal output. On Friday, they were approached by mediators representing the farmers and cattle growers, who reported that President Donnelly would no longer demand the restoration of all the strikers within ten days. But the packers said that they were not inclined to concede anything, because they were in a position to ignore the unions. They were still, however, ready to stand by the original agreement. The strikers assert that this agreement was violated by the companies. On the 25th ult., those by whom the original strike was renewed were reinforced by the unions of the allied trades, about 9,800 men, altho the teamsters waited another day. In New York, however, the order for a renewal of the strike was not obeyed, because the employers had observed the terms of the agreement and the men were getting wages higher than those paid in any other city. On the 27th an order was issued for a strike of the freight handlers on the local distributing railroad in Chicago, but it was soon withdrawn and thereafter was held in abeyance. It was seen that such a strike might draw all the railway workmen into the controversy. The disobedience of the men in New York appears to have served the purpose of those who sought to cause a break in the packers' alliance and who hoped for the secession of the Cudahys and Schwarzchild & Sulzberger. After all hope of such a break had been given up, a second and peremptory order

to the New York men was issued, to take effect this week. Much bitterness was caused on the 29th by the arrest, in Chicago, of George F. Golden, leader of the Teamsters' Union, for giving commands from the window of his office to a passing driver. The police kept him in a cell for an hour. Retail butchers who took meat from the allied packers were blacklisted, and the independent packers were warned that their men would be called out if they should sell meat to these retailers.—Crimes of violence were reported in nearly all the cities affected. In Chicago, during an attack upon the negro non-union workmen, a striker named Stokes was shot and killed. A negro barber, believed to be an employee, was beaten and left for dead. Clarence Hall, an ice dealer, shot by rioters, died two days later. John Mulloy, non-unionist, received dangerous injuries while leaving the yards. In St. Joseph a negro who had been beaten twice resisted a third assault by shooting five strikers, one fatally. In Kansas City the cars bringing negro strike-breakers were attacked and the negroes were driven away. Two companies of militia were called out in Sioux City. In Omaha, where Judge Munger had issued a sweeping injunction, there was much disorder. The sheriff arrested 32 men, whom the packers had brought from Colorado to defend their new employees; 150 strikers were directed to answer this week the charge that they had disobeyed the injunction. On Saturday several of the unions of the allied trades in Chicago sought terms for re-employment. It was reported that the unions would appeal to Mr. Roosevelt, but President Donnelly denied that this would be done, saying that the strikers needed no help.

Other Labor Questions

At Fall River, 71 cotton mills have been silent since the beginning of last week, owing to the strike of 25,000 employees against a wage reduction of 12½ per cent. Unless the strikers yield, the mills will probably be closed until October. There has been no disorder. In several other New England cities a similar reduction has been made. The Southern cotton spinners have voted to reduce their output by 25 per cent. in August and September.—The International Harvester Company has closed its works in Illinois, depriving 15,000 men of work. At the Pullman Car Works, 2,000 men have been discharged during the last four weeks. A majority of the anthracite coal mines are to be closed for a time, owing to a dull market.—Owing to a strike that began some weeks ago on the street railways of Houston, several cars have recently been wrecked by dynamite. On the 25th ult. eight passengers were injured, and three may not recover. On the following night, five passengers were hurt by a similar explosion.—The strike of 40,000 garment workers in New York, against the "open shop," appears to be a failure. Strikers are applying for their old places.—A curious strike is reported in the city of Washington, where the union firemen employed in one of the five breweries quit work to compel the company to join the other four in a combination designed to raise or maintain the price of beer. These four were selling at $6 a barrel; the fifth's price was $4. The strikers' plea was that this low price would close one or two of the other breweries and throw men out of work. Their places were filled and the strike has been declared off.—The troops have been withdrawn from the Cripple Creek district in Colorado, and Governor Peabody has issued a long statement in defense of his course.—All candidates for the House at the coming election will be required by the Federation of Labor to say, in answer to inquiries prepared by President Gompers, whether they will vote against "government by injunction," for an eight-hour day, and to give the people "a direct vote on public questions."

The Countries South of Us

At the opening of the session of Congress in Colombia, last week, the House at once passed a resolution annulling all existing treaties with the United States, and canceling all exequaturs held by our official agents at Colombian ports. The Senate unanimously passed a resolution protesting against the separation of Panama and declining to recognize in any way Panama's declaration of independence. What was called the interven-

tion of the United States in behalf of Panama was also denounced by resolution. There are rumors of a revolt against President Marroquin and President-elect Reyes.—Comptroller Tracewell, of the Treasury Department, in answer to questions from the Panama Canal Commission, has decided that the Commission is not bound by Federal statutes relating to the printing of papers or the renting of offices at Washington; that it must advertise for bids for supplies and work only because the law creating the Commission so provides, and that the money derived from taxation in the canal zone is not such "public money of the United States" as must be accounted for to the Treasury Department. The general spirit and purpose of the Constitution are applicable to the zone, but it is not a part of the United States within the full meaning of the Constitution and the Federal laws. In preparation for sanitary work in the zone the Commission has decided to purchase 100,000 yards of wire gauze for the exclusion of mosquitoes from the houses and hospitals, to prevent malaria and yellow fever infection.—President Castro, of Venezuela, has seized, in behalf of the Government, the asphalt lake at Guanaco and other property of the New York & Bermudez Asphalt Company, which is one of the constituent corporations of the National Asphalt Company, or "Asphalt Trust." Some weeks ago he demanded from the company $9,650,000, alleging that by giving aid to revolutionists it had increased by that sum the cost of subduing the revolt. Bringing suit for this amount in the Venezuelan Supreme Court, where the defense was not represented, he obtained a judgment last week. A. H. Carner, formerly managing director of the company, was appointed Receiver, and on the 29th ult., accompanied by the Venezuelan Attorney-General and a military force, he took possession of the property, against the protests of the agent in charge. The same court, some time ago, upheld the company's right to the asphalt deposits, in a memorable controversy with certain claimants. United States Minister Bowen has been instructed by our Government to send to the State Department a full report of what has taken place. Representatives of the company in this country assert that Castro has undertaken to deprive the corporation of its property in the interest of local companies to which concessions have been granted.—Secretary Hartzell, of Porto Rico, has resigned. He will represent the Government next winter at the trial of cases involving the title to $3,000,000 worth of property, which is claimed by the Catholic Church and also by the Insular Government and certain municipalities.—The German Minister at Caracas was reported to have demanded immediate payment by Venezuela of interest on the amount of the award to be paid to Germany as stipulated in the protocols signed by Minister Bowen (as the representative of Venezuela) in February, 1903, but as we go to press this is denied.

France and the Vatican

The Papal Secretary, Merry del Val, has ordered the recall of the Papal Nuncio at Paris, Monsignor Lorenzelli, and so broken off diplomatic relations with France. The French note gives the following justification of the action:

"After having on several occasions pointed out the serious blows struck at the Government's rights under the Concordat by the Vatican's dealing directly with the French bishops without consultation with the Power with whom the Concordat was signed, and seeing that the Pontifical Secretary of State in his reply of July 25th affirmed those proceedings, the Republican Government has decided to conclude official relations, which at the Holy See's desire had become objectless."

Bishop Nordez, of Dijon, has chosen to obey the Church rather than the state, and has gone to Rome. He was accused of being affiliated with Free Masonry, and the pupils of the theological seminary refused to receive ordination at his hands. Against the Bishop of Laval there were several charges of misdemeanor. When the bishops were summoned to Rome to give an account of themselves to their ecclesiastical superiors they were forbidden by the Government to leave their posts. The Vatican responded by a threat of extreme ecclesiastical penalties in case of continued disobedience and a denial of the right of the French

Government to interfere with the discipline of the Church.

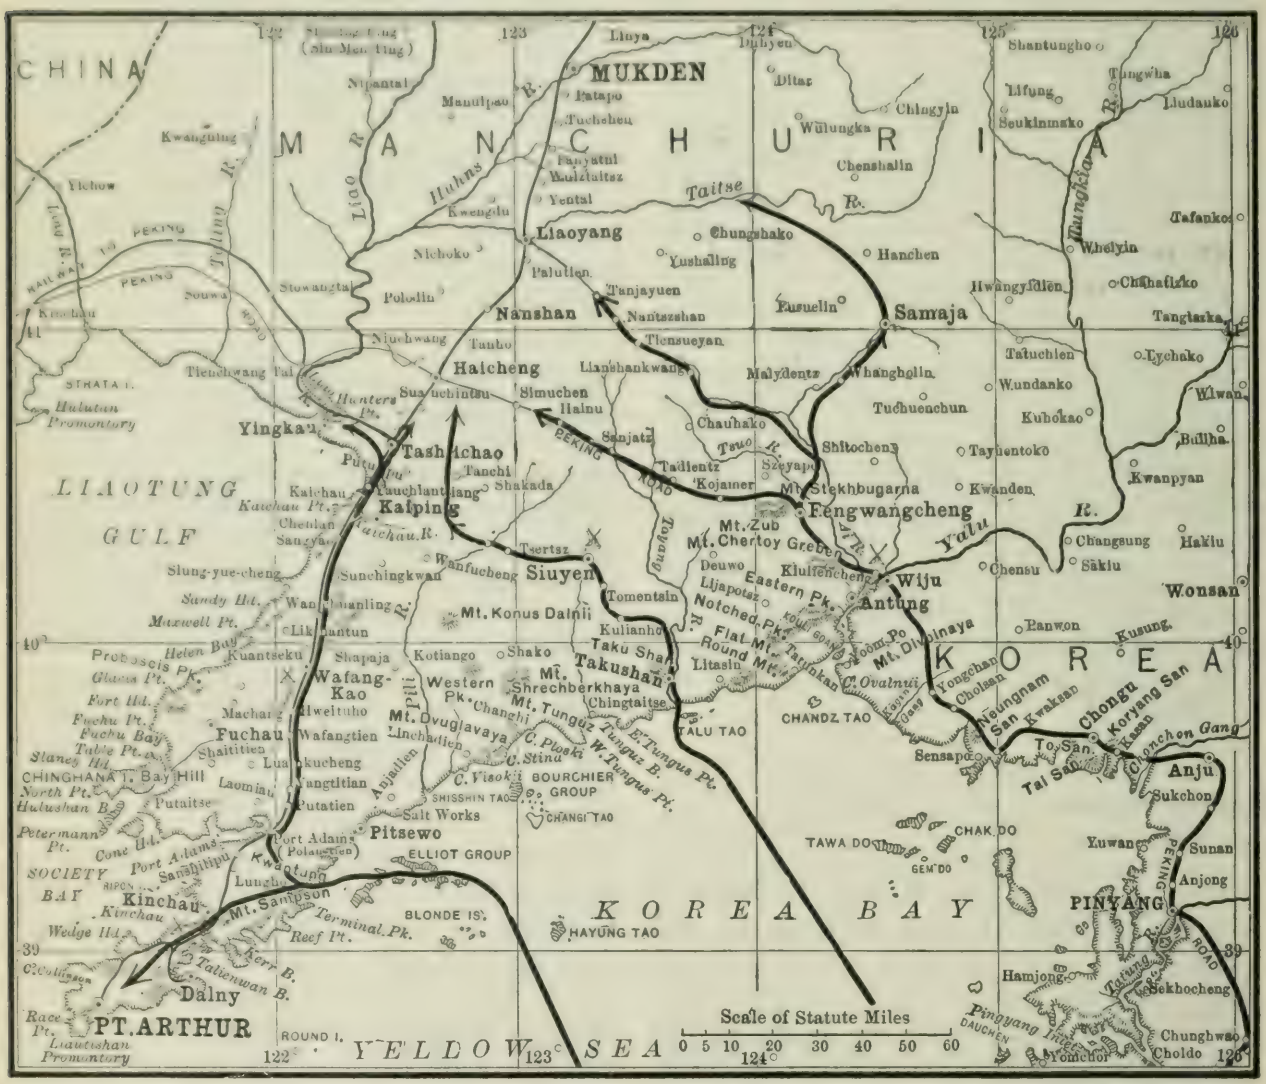
Popularizing New Theology in Germany

The conservative church in the land of Luther is beginning to look with something like alarm at the systematic efforts made to introduce the ideas, not ideals, of modern theology in the pulpits and in the schools. It is an interesting thing that the two devotional books that now enjoy the greatest popularity in the German Church are both exponents of advanced thought—namely, the *Dorfpredigter* by Frenssen, of which about fifty thousand copies have been sold, and the *Andachten* of Fr. Naumann, of which more than twenty thousand are in circulation. It is also interesting that both of these popular writers have left their pulpits and are pushing their propaganda as laymen. At the recent centennial of the Heidelberg University both received that distinction so rare in Germany, the title of Doctor of Theology. Sermons of this character are appearing in considerable number now, among the best being those of Professor Baumgarten, of the University of Kiel, whom the almost unanimous protest of the pastors of Schleswig-Holstein could not oust from his chair. Probably the most successful medium for modern theology is the *Christliche Welt,* a weekly edited with marked skill by Dr. Rade, of the University of Marburg. Around this flock " Friends of the Christlich Welt," in all parts of the Empire, who meet and form associations to discuss and advance the newer views in the pulpit, pew and school. Only recently have these societies changed their former program, and will be active henceforth also in a political way. In many sections of Germany practically the whole corps of school teachers, who also impart religious instructions, is on the side of the advanced men.

The Assassination of Plehve

The Russian Minister of the Interior, Wyatscheslav Konstatinovitch Plehve, was assassinated at ten o'clock on the morning of July 28th while driving to the Baltic station to visit the Czar at Peterhof palace. The assassin, a man about twenty-five years old, wearing an official railroad cap, stood on the sidewalk near the canal bridge, and as the carriage passed he rushed out into the street and threw a bomb loaded with nails and some very powerful explosive, probably gun-cotton. The bomb exploded as it struck the hind wheel and completely shattered the vehicle, causing frightful injury to persons and buildings in the vicinity. The lower part of Mr. De Plehve's face was blown off and the whole body mangled. Twenty persons were injured by the shock, seven of them seriously. The windows of all the houses in the neighborhood were broken, the pavement torn up and fragments of the carriage thrown to a great distance. The assassin, Pozoroff, was severely injured by the flying splinters and refused to give any information as to his fellow conspirators. He was at once arrested by the detectives who were riding on bicycles beside the carriage. As in the case of the assassination of Alexander II, an accomplice was stationed a little further on to repeat the attempt in case the first failed. When he heard the explosion he embarked on the canal in a boat and dropped his bomb overboard, but he was detected by the boatman and delivered over to the police. Mr. De Plehve was buried on Sunday at the Novedevichy Monastery in St. Petersburg, after a solemn Orthodox service, attended by the court and foreign representatives. The Emperor walked with the mourners from the church, following the hearse. Coming so soon after the assassination of Bobrikoff, the Governor of Finland, the event has confirmed the popular belief in a widespread nihilistic conspiracy. The former Minister of the Interior, Sipiaguine, was killed on April 16th, 1902, by a student named Balmaschoff. Mr. De Plehve was born in 1848, and was of Polish descent, yet it was by his success in detecting and his severity in punishing the Polish revolutionists that he acquired the reputation as an efficient public prosecutor which caused him to be called from Warsaw to St. Petersburg. In the prosecution of the conspirators after the explosion in the Winter Palace and assassination of Alexander II he distinguished himself by the efficient, but unscrupulous, measures he used in the suppression of revolutionary movements and in checking liberal tendencies. As chief of the secret

police, the "Third Section," so familiar to us from novels and melodramas, and through his control of the press of the Empire, he became the most powerful and most dreaded of Russian officials. At the accession of Nicholas II he was appointed Secretary of State for Finland, where he began his policy of Russification, which he so relentlessly carried out ever since. As Minister of the Interior in 1884 and in 1902 he suppressed student and peasant riots with great energy and imposed continuously more oppressive restrictions on the alien elements in the Empire, especially the Jews and Germans. In how far he was directly responsible for the massacres of Kishenef will probably never be known, but it is generally supposed that the authorities were kept from interference because it was thought the mob was working his will, even if they were not guided by his secret instructions. Recently he has been compelled to relax somewhat his reactionary policy, and had introduced in the Imperial Council a bill for the repeal of the law forbidding the Jews to reside within thirty-two miles of the frontier. He also drafted the new Peasant Code, to carry out the reforms in the condition of the peasants indicated by the Czar in his manifesto.



Russian Attacks on Commerce

The Vladivostok squadron is still busily engaged in the seizing of trading vessels containing contraband of war. The seizure and sinking of the British steamer "Knight Commander" was made the subject of a vigorous protest by Premier Balfour, in reply to which the Russian Ambassador at London informed Lord Lansdowne that his Government is ready to make reparation in case any wrong has been committed, but asked that the report of the commander of the Vladivostok squadron be awaited before action is taken, in order that an examination of the ship's papers should determine the character of its cargo. The Russian Government holds that the sinking of the ship was justified since she bore contraband of war, and it was impossible to convey the ship to a home port on account of the distance and danger. The steamer "Arabia," of the Hamburg-American line, chartered by the American Trading Company, was captured near the Japanese coast by the squadron and sent to Vladivostok with a prize crew from the "Gromoboi." The cargo consisted of 2,706 tons of flour billed to Hong Kong, and 466 tons of flour and 542 tons of railroad material billed to Japanese ports. The vessel will be released after the removal of that portion of the cargo bound for Japan which is held to be contraband. The Peninsula and Oriental steamer "Malacca," seized in the Red Sea, July 16, has been released, and the "Formosa," of the same line, has been seized by the "Smolensk" and sent to Suez under a prize crew. The British steamer "Chalchas," from Puget Sound to Japan, loaded with flour, machinery, etc., has been captured by the Vladivostok squadron.

The Capture of Tashi-Chiao and Niuchwang

As shown on the map, the Japanese have recently made important progress. The three armies have worked together in their gigantic maneuvers, and the Russian position all along the line has been threatened from the east at the same time it has suffered from a strong attack on the south. General Kuropatkin has been forced to withdraw from Tashi-Chiao to Hai-Cheng and may have to retire still further north to avoid being cut off from Mukden. The heavy lines on the map trace the movements of the three Japanese armies since entering Manchuria, and the arrow heads at the ends show the present positions of their outposts as compared with those occupied a month ago, indicated by the other arrow heads. The first Japanese army, under General Kuroki, has made a demonstration in the direction of Mukden, the capital of Manchuria; the second army, under General Oku, has captured Tashi-Chiao in a bloody battle and has occupied Ying-Kau (Ying-Kow), the treaty port of Niuchwang. The third army from Takushan, under General Nodzu, did not, according to the Japanese accounts, in contradiction to the Russian reports, take part in the battle of Tashi-Chiao, but continued its march northward, on the road to Hai-Cheng, parallel to the railroad, and so threatening the Russian left. Lieutenant-General Sakharoff states that the Russians had no intention of holding

Tashi-Chiao, but "occupied the position solely with a view of keeping the enemy in check, and with no idea of obstinately defending it." However this may be, it is difficult to see how the Russians could have defended it any more obstinately if they had intended to, for it was only after two days' hard fighting that they gave way. The village of Tashi-Chiao is situated in a plain on a small stream running into the Liao River, near Ying-Kau. A little to the south of it is an isolated hill, some 200 feet high, called Ta-Ping-Shan (great level mountain). The Russians had made this their strongest point, and from it proceeded the heavy artillery fire which kept off the Japanese all day Sunday, the 24th. Repeated attacks on this and other hills south of Tashi-Chiao were repulsed by the bayonet. Sunday night General Oku attacked and carried the Russian outposts farthest to the east and west of the railroads, and, being thus outflanked on both wings and having to sustain a heavy attack on the center, the Russians were obliged to retreat to Hai-Cheng. The estimates of losses are so contradictory and untrustworthy, varying from 700 to 5,000 on each side, that it is useless to repeat them. Ying-Kau on the Liao River, where are the custom houses and the railroad station of Niuchwang, was abandoned without a struggle and was occupied by a small detchment of General Oku's army. The possession of Niuchwang is very important since it is one of the open ports, and the Chinese have so strongly protested against its occupation by the Russians. The Japanese when they entered the city offered the western custom house to the Chinese, but the Pekin Government refused to accept the responsibility.

Map of the Seat of War.—The heavy lines show the movements of the three Japanese armies and the arrow points their present position

From Lithuania to the Chicago Stockyards—An Autobiography

BY ANTANAS KAZTAUSKIS

[Last week we printed an illuminating article by Ernest Poole on the Chicago meat strike. The following autobiography was dictated to Mr. Poole for THE INDEPENDENT. It is a trustworthy narrative, and we believe a typical one. It is of especial timeliness just now on account of the side light it throws on the life of a worker in the Stockyards. —EDITOR.]

THIS is not my real name, because if this story is printed it may be read back in Lithuania, and I do not want to get my father and the ugly shoemaker into trouble with the Russian Government.

It was the shoemaker who made me want to come to America. He was a traveling shoemaker, for on our farms we tan our own cowhides, and the shoemaker came to make them into boots for us. By traveling he learned all the news and he smuggled in newspapers across the frontier from Germany. We were always glad to hear him talk.

I can never forget that evening four years ago. It was a cold December. We were in a big room in our log house in Lithuania. My good, kind, thin old mother sat near the wide fireplace, working her brown spinning wheel, with which she made cloth for our shirts and coats and pants. I sat on the floor in front of her with my knee-boots off and my feet stretched out to the fire. My feet were cold, for I had been out with my young brother in the freezing sheds milking the cows and feeding the sheep and geese. I leaned my head on her dress and kept yawning and thinking about my big goose feather bed. My father sat and smoked his pipe across the fireplace. Between was a kerosene lamp on a table, and under it sat the ugly shoemaker on a stool finishing a big yellow boot. His sleeves were rolled up; his arms were thin and bony, but you could see how strong the fingers and wrist were, for when he grabbed the needle he jerked it through and the whole arm's length up. This arm kept going up and down. Every time it went up he jerked back his long mixed-up red hair and grunted. And you could just see his face—bony and shut together tight, and his narrow sharp eyes looking down. Then his head would go down again, and his hair would get all mixed up. I kept watching him. My fat, older brother, who sat behind with his fat wife, grinned and said: "Look out or your eyes will make holes in the leather." My brother's eyes were always dull and sleepy. Men like him stay in Lithuania.

At last the boot was finished. The little shoemaker held it up and looked at it. My father stopped smoking and looked at it. "That's a good boot," said my father. The shoemaker grunted. "That's a damn poor boot," he replied (instead of "damn" he said "skatina"), "a rough boot like all your boots, and so when you grow old you are lame. You have only poor things, for rich Russians get your good things, and yet you will not kick up against them. Bah!"

"I don't like your talk," said my father, and he spit into the fire, as he always did when he began to think. "I am honest. I word hard. We get along. That's all. So what good will such talk do me?"

"You!" cried the shoemaker, and he now threw the boot on the floor so that our big dog lifted up his head and looked around. 'It's not you at all. It's the boy—that boy there!" and he pointed to me. "That boy must go to America!"

Now I quickly stopped yawning and I looked at him all the time after this. My mother looked frightened and she put her hand on my head. "No, no; he is only a boy," she said. "Bah!" cried the shoemaker, pushing back his hair, and then I felt he was looking right through me. "He is eighteen and a man. You know where he must go in three years more." We all knew he

meant my five years in the army. "Where is your oldest son? Dead. Oh, I know the Russians—the man-wolves! I served my term, I know how it is. Your son served in Turkey in the mountains. Why not here? Because they want foreign soldiers here to beat us. He had four roubles ($2.08) pay for three months, and with that he had to pay men like me to make his shoes and clothes. Oh, the wolves! They let him soak in rain, standing guard all night in the snow and ice he froze, the food was God's food, the vodka was cheap and rotten! Then he died. The wolves—the man wolves! Look at this book." He jerked a Roman Catholic prayer book from his bag on the floor. "Where would I go if they found this on me? Where is Wilhelm Birbell?"

At this my father spit hard again into the fire and puffed his pipe fast.

"Where is Wilhelm Birbell," cried the shoemaker, and we all kept quiet. We all knew. Birbell was a rich farmer who smuggled in prayer books from Germany so that we all could pray as we liked, instead of the Russian Church way. He was caught one night and they kept him two years in the St. Petersburg jail, in a cell so narrow and short that he could not stretch out his legs, for they were very long. This made him lame for life. Then they sent him to Irkutsk, down in Siberia. There he sawed logs to get food. He escaped and now he is here in Chicago. But at that time he was in jail.

"Where is Wilhelm Birbell?" cried the shoemaker. "Oh, the wolves! And what is this?" He pulled out an old American newspaper, printed in the Lithuanian language, and I remember he tore it he was so angry. "The world's good news is all kept away. We can only read what Russian officials print in their papers. Read? No, you can't read or write your own language, because there is no Lithuanian school—only the Russian school—you can only read and write Russian. Can you? No, you can't! Because even those Russian schools make you pay to learn, and you have no money to pay. Will you never be ashamed—all you? Listen to me."

Now I looked at my mother and her face looked frightened, but the shoemaker cried still louder. "Why can't you have your own Lithuanian school? Because you are like dogs—you have nothing to say—you have no town meetings or province meetings, no elections. You are slaves! And why can't you even pay to go to their Russian school? Because they get all your money. Only twelve acres you own, but you pay eighty roubles ($40) taxes. You must work twelve days on your Russian roads. Your kind old wife must plow behind the oxen, for I saw her last summer, and she looked tired. You must all slave, but still your rye and wheat brings little money, because they cheat you bad. Oh, the wolves—how fat they are! And so your boy must never read or write, or think like a man should think."

But now my mother cried out, and her voice was shaking. "Leave us alone—you leave us! We need no money—we trade our things for the things we need at the store—we have all we need—leave us alone!"

Then my fat brother grinned and said to the shoemaker, "You always stir up young men to go to America. Why don't you go yourself?"

I remeber that the little shoemaker had pulled a big crooked pipe out of his bag. Now he took a splinter from the basket of splinters which hung on the wall and he lit his pipe and puffed it. His face showed me that he felt bad. "I am too old," he said, "to learn a new trade. These boots are no good in America. America is no place for us old rascals. My son is in Chicago in the stockyards, and he writes to me. They have hard knocks. If you are sick or old there and have no money you must die. That Chicago place has trouble, too. Do you see that light? That is kerosene. Do you remember the price went up last year? That is Rockefeller. My son writes me about him. He is another man wolf. A few men like him are grabbing all the good things,—the oil and coal and meat and everything. But against these men you can strike if you are young. You can read free papers and prayer books. In Chicago there are prayer books for every man and woman. You can have free meetings and talk out what you think. And so if you are young you can change all these troubles. But I am old. I can feel it now, this winter. So I only tell young men to go." He

looked hard at me and I looked at him. He kept talking. "I tell them to go where they can choose they own kind of God—where they can learn to read and write, and talk, and think like men—and have good things!"

He kept looking at me, but he opened the newspaper and held it up. "Some day," he said, "I will be caught and sent to jail, but I don't care. I got this from my son, who reads all he can find at night. It had to be smuggled in. I lend it many times to many young men. My son got it from the night school and he put it in Lithuanian for me to see." Then he bent over the paper a long time and his lips moved. At last he looked into the fire and fixed his hair, and then his voice was shaking and very low:

"'We know these are true things—that all men are born free and equal—that God gives them rights which no man can take away—that among these rights are life, liberty and the getting of happiness.'"

He stopped, I remember, and looked at me, and I was not breathing. He said it again. "'Life, liberty and the getting of happiness.' Oh, that is what you want."

My mother began to cry. "He cannot go if his father commands him to stay," she kept saying. I knew this was true, for in Lithuania a father can command his son till he dies.

"No, he must not go," said the shoemaker, "if his father commands him to stay. He turned and looked hard at my father. My father was looking into the fire. "If he goes," said my father, "those Russians will never let him come back." My mother cried harder. We all waited for him to say something else. In about five minutes the shoemaker got up and asked, "Well, what do you say,—the army or America?" But my father shook his head and would not say anything. Soon my brother began yawning and took his fat wife and went to bed. The little shoemaker gathered his tools into his big bag and threw it over his shoulder. His shoulder was crooked. Then he came close to me and looked at me hard.

"I am old," he said, "I wish I was young. And you must be old soon and that will be too late. The army—the man wolves! Bah! it is terrible."

After he was gone my father and I kept looking at the fire. My mother stopped crying and went out. Our house was in two parts of two rooms each. Between the parts was an open shed and in this shed was a big oven, where she was baking bread that night. I could hear her pull it out to look at it and then push it back. Then she came in and sat down beside me and began spinning again. I leaned against her dress and watched the fire and thought about America. Sometimes I looked at my father, and she kept looking at him, too, but he would not say anything. At last my old mother stopped spinning and put her hand on my forehead.

"Alexandria is a fine girl," she whispered. This gave me a quick bad feeling. Alexandria was the girl I wanted to marry. She lived about ten miles away. Her father liked my father and they seemed to be glad that I loved her. I had often been thinking at night how in a few years I would go with my uncle to her house and ask her father and mother to give her to me. I could see the wedding all ahead—how we would go to her house on Saturday night and they would have music there and many people and we would have a sociable time. Then in the morning we would go to the church and be married and come back to my father's house and live with him. I saw it all ahead, and I was sure we would be very happy. Now I began thinking of this. I could see her fine soft eyes and I hated to go away. My old mother kept her hands moving on my forehead. "Yes, she is a nice girl; a kind, beautiful girl," she kept whispering. We sat there till the lamp went out. Then the fire got low and the room was cold and we went to bed. But I could not sleep and kept thinking.

The next day my father told me that I could not go until the time came for the army, three years ahead. "Stay until then and then we will see," he said. My mother was very glad and so was I, because of Alexandria. But in the coldest part of that winter my dear old mother got sick and died. The neighbors all came in and sang holy songs for two days and nights. The priest was

there and my father bought fine candles. Two of the neighbors made a coffin. At last it was all over. For a long time our log house was always quiet.

That summer the shoemaker came again and talked with me. This time I was very eager to go to America, and my father told me I could go.

One morning I walked over to say good-by to Alexandria. It was ten miles and the road was dusty, so I carried my boots over my shoulder, as we always did, and I put them on when I came near her house. When I saw her I felt very bad, and so did she. I had the strongest wish I ever had to take hold of her and keep her all my life. We stayed together till it was dark and night fogs came up out of the field grass, and we could hardly see the house. Then she said good-by. For many nights I kept remembering the way she looked up at me.

The next night after supper I started. It is against the law to sell tickets to America, but my father saw the secret agent in the village and he got a ticket from Germany and found us a guide. I had bread and cheese and honey and vodka and clothes in my bag. Some of the neighbors walked a few miles and said good-by and then went back. My father and my younger brother walked on all night with the guide and me. At daylight we came to the house of a man the guide knew. We slept there and that night I left my father and young brother. My father gave me $50 besides my ticket. The next morning before light we were going through the woods and we came to the frontier. Three roads run along the frontier. On the first road there is a soldier every mile, who stands there all night. On the second road is a soldier every half mile, and on the third road is a soldier every quarter of a mile. The guide went ahead through the woods. I hid with my big bag behind a bush and whenever he raised his hand I sneaked along. I felt cold all over and sometimes hot. He told me that sometimes he took twenty immigrants together, all without passports, and then he could not pass the soldiers and so he paid a soldier he knew one dollar a head to let them by. He said the soldier was very strict and counted them to see that he was not being cheated.

So I was in Germany. Two days after that we reached Tilzit and the guide took me to the railroad man. This man had a crowd of immigrants in a room, and we started that night on the railroad—fourth class. It was bad riding sometimes. I used to think of Alexandria. We were all green and slow. The railroad man used to say to me, "You will have to be quicker than this in Chicago," and he was right. We were very slow in the stations where we changed trains, and he used to shout at us then, and one old German man who spoke Lithuanian told me what the man was calling us. When he told me this I hurried, and so did the others, and we began to learn to be quicker. It took three days to get to Hamburg. There we were put in a big house called a barracks, and we waited a week. The old German man told me that the barracks men were cheating us. He had been once to Cincinnati in America to visit his son, who kept a saloon. His old, long pipe was stolen there. He kept saying, "Dem grafters, dem grafters," in a low voice whenever they brought food to sell, for our bags were now empty. They kept us there till our money was half spent on food. I asked the old man what kind of American men were grafters, and he said "All kinds in Cincinnati, but more in Chicago!" I knew I was going to Chicago, and I began to think quicker. I thought quicker yet on the boat. I saw men playing cards. I played and lost $1.86 in my new money, till the old man came behind me and said, "Dem grafters." When I heard this I got scared and threw down my cards. That old man used to point up at the rich people looking down at us and say "Dem grafters." They were the richest people I had ever seen—the boat was the biggest boat I had ever seen —the machine that made it go was very big, and so was the horn that blew in a fog. I felt everything get bigger and go quicker every day.

It was the most when we came to New York. We were driven in a thick crowd to the railroad station. The old man kept pointing and saying "Grafters, grafters," till the guide punched him and said, "Be quick, damn you, be

quick." . . . "I will be quick pretty soon," said the old man to me, "and den I will get back dot pipe in Cincinnati. And when I will be quicker still, alreddy, I will steal some odder man's pipe. Every quick American man is a grafter." I began to believe that this was true, but I was mixed up and could not think long at one time. Everything got quicker—worse and worse—till then at last I was in a boarding house by the stockyards in Chicago, with three Lithuanians, who knew my father's sisters at home.

That first night we sat around in the house and they asked me, "Well, why did you come?" I told them about that first night and what the ugly shoemaker said about "life, liberty and the getting of happiness." They all leaned back and laughed. "What you need is money," they said. "It was all right at home. You wanted nothing. You ate your own meat and your own things on the farm. You made your own clothes and had your own leather. The other things you got at the Jew man's store and paid him with sacks of rye. But here you want a hundred things. Whenever you walk out you see new things you want, and you must have money to buy everything."

Then one man asked me, "How much have you?" and I told him $30. "You must buy clothes to look rich, even if you are not rich," he said. "With good clothes you will have friends."

The next morning three of these men took me to a store near the stockyards to buy a coat and pants. "Look out," said one of them. "Is he a grafter?" I asked. They all laughed. "You stand still. That is all you have to do," they said. So the Jew man kept putting on coats and I moved my arms and back and sides when they told me. We stayed there till it was time for dinner. Then we bought a suit. I paid $5 and then I was to pay $1 a week for five weeks.

In the afternoon I went to a big store. There was a man named Elias. "He is not a grafter," said my friends. He was nice to me and gave me good advice how to get a job. I bought two shirts, a hat, a collar, a necktie, two pairs of socks and some shoes. We kept going upstairs and downstairs. I saw one Lithuanian man buying everything for his wife and three children, who would come here the next week from Lithuania. My things cost me $8. I put these on right away and then I began to feel better.

The next night they took me for a walk down town. We would not pay to ride, so we walked so long that I wanted to take my shoes off, but I did not tell them this. When we came there I forgot my feet. We stood by one theater and watched for half an hour. Then we walked all around a store that filled one whole block and had walls of glass. Then we had a drink of whisky, and this is better than vodka. We felt happier and looked into *cafés*. We saw shiny carriages and automobiles. I saw men with dress suits, I saw women with such clothes that I could not think at all. Then my friends punched me and I turned around and saw one of these women, and with her was a gentleman in a fine dress suit. I began looking harder. It was the Jew man that sold me my suit. "He is a grafter," said my friends. "See what money can do." Then we walked home and I felt poor and my shoes got very bad.

That night I felt worse. We were tired out when we reached the stockyards, so we stopped on the bridge and looked into the river out there. It was so full of grease and dirt and sticks and boxes that it looked like a big, wide, dirty street, except in some places, where it boiled up. It made me sick to look at it. When I looked away I could see on one side some big fields full of holes, and these were the city dumps. On the other side were the stockyards, with twenty tall slaughter house chimneys. The wind blew a big smell from them to us. Then we walked on between the yards and the dumps and all the houses looked bad and poor. In our house my room was in the basement. I lay down on the floor with three other men and the air was rotten. I did not go to sleep for a long time. I knew then that money was everything I needed. My money was almost gone and I thought that I would soon die unless I got a job, for this was not like home. Here money was everything and a man without money must die.

The next morning my friends woke me up at five o'clock and said, "Now, if you want life, liberty and happiness," they laughed, "you must push for yourself. You must get a job. Come with us."

And we went to the yards. Men and women were walking in by thousands as far as we could see. We went to the doors of one big slaughter house. There was a crowd of about 200 men waiting there for a job. They looked hungry and kept watching the door. At last a special policeman came out and began pointing to men, one by one. Each one jumped forward. Twenty-three were taken. Then they all went inside, and all the others turned their faces away and looked tired. I remember one boy sat down and cried, just next to me, on a pile of boards. Some policemen waved their clubs and we all walked on. I found some Lithuanians to talk with, who told me they had come every morning for three weeks. Soon we met other crowds coming away from other slaughter houses, and we all walked around and felt bad and tired and hungry.

That night I told my friends that I would not do this many days, but would go some place else. "Where?" they asked me, and I began to see then that I was in bad trouble, because I spoke no English. Then one man told me to give him $5 to give the special policeman. I did this and the next morning the policeman pointed me out, so I had a job. I have heard some big talk since then about my American freedom of contract, but I do not think I had much freedom in bargaining for this job with the Meat Trust. My job was in the cattle killing room. I pushed the blood along the gutter. Some people think these jobs make men bad. I do not think so. The men who do the killing are not as bad as the ladies with fine clothes who come every day to look at it, because they have to do it. The cattle do not suffer. They are knocked senseless with a big hammer and are dead before they wake up. This is done not to spare them pain, but because if they got hot and sweating with fear and pain the meat would not be so good. I soon saw that every job in the room was done like this—so as to save everything and make money. One Lithuanian, who worked with me, said, "They get all the blood out of those cattle and all the work out of us men." This was true, for we worked that first day from six in the morning till seven at night. The next day we worked from six in the morning till eight at night. The next day we had no work. So we had no good, regular hours. It was hot in the room that summer, and the hot blood made it worse.

I held this job six weeks and then I was turned off. I think some other man had paid for my job, or perhaps I was too slow. The foreman in that room wanted quick men to make the work rush, because he was paid more if the work was done cheaper and quicker. I saw now that every man was helping himself, always trying to get all the money he could. At that time I believed that all men in Chicago were grafters when they had to be. They only wanted to push themselves. Now, when I was idle I began to look about, and everywhere I saw sharp men beating out slow men like me. Even if we worked hard it did us no good. I had saved $13—$5 a week for six weeks makes $30, and take off $15 for six weeks' board and lodging and $2 for other things. I showed this to a Lithuanian, who had been here two years, and he laughed. "It will be taken from you," he said. He had saved a hundred dollars once and had begun to buy a house on the instalment plan, but something had happened that he did not know about and his landlord put him out and kept the hundred dollars. I found that many Lithuanians had been beaten this way. At home we never made a man sign contract papers. We only had him make the sign of a cross and promise he would do what he said. But this was no good in Chicago. So these sharp men were beating us.

I saw this, too, in the newspaper. I was beginning to learn English, and at night in the boarding house the men who did not play cards used to read the paper to us. The biggest word was "Graft" in red letters on the front page. Another word was "Trust." This paper kept putting these two words together. Then I began to see how every American man was trying to get money for himself. I wondered if the old German man in Cincinnati had found his pipe yet. I felt very bad and sorrowful in that month. I kept walking around with many other Lithuanians who had no job. Our money was going and we could find nothing to do. At night we got homesick for our fine green mountains. We read all the

news about home in our Lithuanian Chicago newspaper, *The Katalikas*. It is a good paper and gives all the news. In the same office we bought this song, which was written in Brooklyn by P. Brandukas. He, too, was homesick. It is sung all over Chicago now and you can hear it in the summer evenings through the open windows. In English it is something like this:

"Oh, Lithuania, so dear to me,
Good-by to you, my Fatherland.
Sorrowful in my heart I leave you,
I know not who will stay to guard you.

Is it enough for me to live and enjoy between my neighbors,
In the woods with the flowers and birds?
Is it enough for me to live peaceful between my friends?
No, I must go away from my old father and mother.

The sun shines bright,
The flowers smell sweet,
The birds are singing,
They make the country glad;
But I cannot sing because I must leave you."

Those were bad days and nights. At last I had a chance to help myself. Summer was over and Election Day was coming. The Republican boss in our district, Jonidas, was a saloonkeeper. A friend took me there. Jonidas shook hands and treated me fine. He taught me to sign my name, and the next week I went with him to an office and signed some paper, and then I could vote. I voted as I was told, and then they got me back into the yards to work, because one big politician owns stock in one of those houses. Then I felt that I was getting in beside the game. I was in a combine like other sharp men. Even when work was slack I was all right, because they got me a job in the street cleaning department. I felt proud, and I went to the back room in Jonidas's saloon and got him to write a letter to Alexandria to tell her she must come soon and be my wife.

But this was just the trouble. All of us were telling our friends to come soon. Soon they came—even thousands. The employers in the yard liked this, because those sharp foremen are inventing new machines and the work is easier to learn, and so these slow Lithuanians and even green girls can learn to do it, and then the Americans and Germans and Irish are put out and the employer saves money, because the Lithuanians work cheaper. This was why the American labor unions began to organize us all just the same as they had organized the Bohemians and Poles before us.

Well, we were glad to be organized. We had learned that in Chicago every man must push himself always, and Jonidas had taught us how much better we could push ourselves by getting into a combine. Now, we saw that this union was the best combine for us, because it was the only combine that could say, "It is our business to raise your wages."

But that Jonidas—he spoilt our first union. He was sharp. First he got us to hire the room over his saloon. He used to come in at our meetings and sit in the back seat and grin. There was an Irishman there from the union headquarters, and he was trying to teach us to run ourselves. He talked to a Lithuanian, and the Lithuanian said it to us, but we were slow to do things, and we were jealous and were always jumping up to shout and fight. So the Irishman used to wipe his hot red face and call us bad names. He told the Lithuanian not to say these names to us, but Jonidas heard them, and in his saloon, where we all went down after the meeting when the Irishman was gone, Jonidas gave us free drinks and then told us the names. I will not write them here.

One night that Irishman did not come and Jonidas saw his chance and took the chair. He talked very fine and we elected him President. We made him Treasurer, too. Down in the saloon he gave us free drinks and told us we must break away from the Irish grafters. The next week he made us strike, all by himself. We met twice a day in his saloon and spent all of our money on drinks and then the strike was over. I got out of this union after that. I had been working hard in the cattle killing room and I had a better job. I was called a cattle butcher now and I joined the Cattle Butchers' Union. This union is honest and it has done me a great deal of good.

It has raised my wages. The man who worked at my job before the union came

was getting through the year an average of $9 a week. I am getting $11. In my first job I got $5 a week. The man who works there now gets $5.75.

It has given me more time to learn to read and speak and enjoy life like an American. I never work now from 6 a.m. to 9 p.m. and then be idle the next day. I work now from 7 a.m. to 5.30 p.m., and there are not so many idle days. The work is evened up.

With more time and more money I live much better and I am very happy. So is Alexandria. She came a year ago and has learned to speak English already. Some of the women go to the big store the day they get here, when they have not enough sense to pick out the clothes that look right, but Alexandria waited three weeks till she knew, and so now she looks the finest of any woman in the district. We have four nice rooms, which she keeps very clean, and she has flowers growing in boxes in the two front windows. We do not go much to church, because the church seems to be too slow. But we belong to a Lithuanian society that gives two picnics in summer and two big balls in winter, where we have a fine time. I go one night a week to the Lithuanian Concertina Club. On Sundays we go on the trolley out into the country.

But we like to stay at home more now because we have a baby. When he grows up I will not send him to the Lithuanian Catholic school. They have only two bad rooms and two priests, who teach only in Lithuanian from prayer books. I will send him to the American school, which is very big and good. The teachers there are Americans and they belong to the Teachers' Labor Union, which has three thousand teachers and belongs to our Chicago Federation of Labor. I am sure that such teachers will give him a good chance.

Our union sent a committee to Springfield last year and they passed a law which prevents boys and girls below sixteen from working in the stockyards.

We are trying to make the employers pay on Saturday night in cash. Now they pay in checks and the men have to get money the same night to buy things for Sunday, and the saloons cash checks by thousands. You have to take one drink to have the check cashed. It is hard to take one drink.

The union is doing another good thing. It is combining all the nationalities. The night I joined the Cattle Butchers' Union I was led into the room by a negro member. With me were Bohemians, Germans and Poles, and Mike Donnelly, the President, is an Irishman. He spoke to us in English and then three interpreters told us what he said. We swore to be loyal to our union above everything else except the country, the city and the State—to be faithful to each other—to protect the women workers—to do our best to understand the history of the labor movement, and to do all we could to help it on. Since then I have gone there every two weeks and I help the movement by being an interpreter for the other Lithuanians who come in. That is why I have learned to speak and write good English. The others do not need me long. They soon learn English, too, and when they have done that they are quickly becoming Americans.

But the best thing the union does is to make me feel more independent. I do not have to pay to get a job and I cannot be discharged unless I am no good. For almost the whole 30,000 men and women are organized now in some one of our unions and they all are directed by our central council. No man knows what it means to be sure of his job unless he has been fired like I was once without any reason being given.

So this is why I joined the labor union. There are many better stories than mine, for my story is very common. There are thousands of immigrants like me. Over 300,000 immigrants have been organized in the last three years by the American Federation of Labor. The immigrants are glad to be organized if the leaders are as honest as Mike Donnelly is. You must get money to live well, and to get money you must combine. I cannot bargain alone with the Meat Trust. I tried it and it does not work.

My young brother came over three weeks ago, to escape being sent out to fight in Japan. I tried to have my father come, too, but he was too old. I wish that ugly little shoemaker would come. He would make a good walking delegate.

CHICAGO, ILL

The Pike

The Pike

BY MRS. L. H. HARRIS

[Our readers will be glad to learn that we have sent Mrs. Harris to see the Exposition for THE INDEPENDENT. We have already discussed the material side of the Fair in several articles with illustrations and maps. Mrs. Harris will deal more with the people, both sights and sightseers. This article will be shortly followed by two others. —EDITOR.]

THE Pike at the St. Louis Fair is not an arbitrary invention, but it is created by the demands of the situation. There is a tadpole extremity in human nature that has never evoluted. It is our caudal relation to the lower order of things. And where great crowds are gathered, something half-sane, irresponsible, disproportioned and ingeniously absurd develops, which corresponds to the mood and demands of the crowd. Thus the Pike is as necessary to the Fair as the Vaudeville is to the Stock Exchange in New York, and for the same reason. The people seen there in the evenings are the ones who have spent the rational, sunlit part of the day studying with delicate appreciation beauty, symmetry and color in the Fine Arts Building. But as night approaches, with the higher faculties fagged, there is the natural revulsion from the sanity of mechanics, the righteousness of art and the simple pumpkin honesty of agricultural exhibits, and every man who is not limited by scruples or prejudices taps his satyr hoof in the universal direction of the Pike. And once he has swept into that laughing, illuminated, madly-colored bedlam, he is as easily entertained by the grotesque, by the prevailing caricature of all things, as he was charmed by their ideality and proportion earlier in the day. He takes the same crude interest in the fakirs, jugglers and mountebanks that less intelligent men do, not because he is really depraved or morbid, but this is his involuntary confession of primitive inter-

Turkish Dancing Girl

est in life. It is his Old Adam mood, which he shares in common with all humanity, and which is singularly honest, whatever else may be said of it. For this reason, any sort of man may find his friends on the Pike, altho he may have missed them everywhere else at the Fair. They all go there, from the Cardinal to the prospective Vice-President, from the hermit student to the *blasé* society man. And they go because they are all blood brothers in the eternally youthful desire to "have some fun." It is a mistake to suppose that children alone have the frolicking instinct. The difference is in the character of the entertainment required. Elder people, having lost the simplicity of youth, crave what is stimulating to their jaded spirits, and, therefore, freakish or monstrous. But the proof that the instinct is still the same may be inferred from the fact that, with few exceptions, every show on the Pike appeals, not to taste or intelligence, but to undisciplined adolescence. That is to say, the whole thing is founded upon the idea that the tadpole extremity of consciousness in us all is eternally young and morbidly curious, rather than rational or discriminating.

To the casual visitor the Pike appears to be a chaotic stretch of clowns, freaks, cheap wonders and restaurants; but really the attractions there may be divided into three distinct classes. First, the live shows, circuses and theatrical performances; second, the mechanical and spectacular effects, such as the Ober-Ammergau Passion Play in the Tyrolean Alps concession, the Galveston Flood, Battle Abbey, a cyclorama of American War History, and Creation; third, the bazaars and industrial features. These are found in the booths along the streets of Cairo and of Ancient Asia, in Fair Japan, and the Chinese Pavilion. (Altho the Irish Village is located here, it does not really belong to the Pike in spirit or purpose. It contains, besides the McKinley cottage —a reproduction of the home of the father to the American President—and numerous historical relics, the most complete exhibition of the arts and industries of Ireland ever seen in this country.) Among the spectacular attractions the Passion Play is unquestionably the most beautiful and elevating in suggestion, but Creation is the most popular. This ingenious illusion purports to be based upon the account given in Genesis of the first six days. When Michael Angelo painted from the same suggestion the ceiling of the Sistine Chapel he represented God in the beginning as formless, a sort of wind sweeping through space. But, with the advent of man and mind, Divinity assumed the nobler aspect of his own creation. This, of course, did not reckon on the evolution of man, but the artist implied the evolution of God, which has always been a more puzzling matter. Now the author of Creation avoids these esoteric issues with an adroitness that will distract his higher critic. He has confined himself to darkness, a ball of fire, a sky and a few stars, much thunder and lightning, moving masses of earth and water, and, finally, a naked young Adam, discovered by an equally un-fig-leaved young Eve. Naturally they are both cheered by their sophisticated modern descendants, who have developed along with an indecent sense of modesty a broad and unscriptural sense of humor. But, whatever the tittering crowd may think, it is evident that the author of this panorama believes that he has done them a service by creating a godly illusion.

But, after all, the live shows are the chief attraction on the Pike. And it is not amiss to say in this connection that the report of the Pike's having been expurgated of questionable features must not be taken too literally. Much depends upon the individual definition of decency. Thus the famous muscle-dance, seen on the old Midways, has not been eliminated. The women simply wear more clothing and dance quite as convincingly. It is not reasonable, indeed, to expect an elevated ideal of modesty and decency in a place frankly created to satisfy the demands of the lower, mortal mind rather than the higher, spiritual and intellectual faculties. The point the Pike makes is that these features are always condemned by people who have not been too scrupulous to witness them, and this is a very good point. Many have a moral caution, indeed, that is highly diverting to the initiated. An illustration of this is found in watching the crowd before the Gay

A Corner of the Tea Garden in "Fair Japan"

Cocopa Indian Mother and Papoose

Paris concession. Here the virtuous eloquence of the "spieler" does not convince respectable elderly ladies and clerically coated gentlemen of the innocent character of the performance going on within the theater. Meanwhile, scores of young bloods flock in, attracted by what they conceive to be an immorally suggestive name. What they really see is a simple and amusing burlesque, especially suited for the entertainment of children. There is, of course, some display of feminine legs, but children least of all are injured by the sight of these very natural extremities. Besides, the best of us have legs, and the worst of us know it; and the Pike is not a place where one can afford to be squeamish in these small matters. For the one universal confession of that thoroughfare is of gifted legs and talented heels. From the Girl of Madrid, who kicks the rose off of her own head, to the Delhi lady who dances with a chair in her mouth, every heroine shows a primitive unconsciousness of these natural endowments which can only be compared to the Igorrotes' blissfully unconcerned nakedness. This is indiscreet, of course, not to say immoral; but the blame attaches more to the people who demand such heroines than to these poor victims of publicity. And the people do demand them. When the Fair opened six weeks ago an historical drama of two acts was played in the theater of the Old St. Louis concession. But the managers were obliged to condense this into one act, buy a dancing girl and a tight-rope fairy before they could attract the crowd.

Not all the dancing is voluptuous or indecent, however; much of it is simply an entrancing expression of gayety and grace. And the male dances, such as the mystic dance, the sword dance and other weird rhythmic performances in Ancient Asia and Cairo, give vivid impressions of the ferocity and secrecy of Oriental nature. The only unmoved spectators upon these occasions are the camels and elephants. These patient creatures suggest the silence and weariness of jungles and deserts by their serenity and toleration in the midst of maddening unrest. They have an ancient dignity which contrasts strangely with the gorgeous trappings and painted dancing-girls on their backs.

The observant visitor is at once impressed with the menagerie aspect of the Pike. Different beasts and races of men are on exhibition, and they all show the same psychic effects of caged animals, restlessness, shamelessness, and a half-tamed fierceness. And they are trained animals, from Hagenbeck's tigers to the lady in pink tights who crawls through her finger-ring in the Roman Amphitheater, "with a smile on her face" (the smile being two or three times the diameter of the ring!)—and they all play to the gallery. There is no art for art's sake in the Pike. The motto there is to "please the crowd." And the crowd, from strutting alderman to street-dog, appears to be that part of the menagerie which has not been caged.

The remarkable thing so far is that the creatures are among the most successful stars on the Pike. Jim Key, the horse mathematician, and Hagenbeck's Animal circus attract larger crowds than any other concessions. It is not so much that these animals are trained, but that they are trained to act as if they had human

emotions and intelligence. Nothing could be more suggestive of Episcopal dignity than the deliberation with which the Polar bear struts across the stage and seats himself in a chair before the table provided for him, and nothing so resembles a drunken lord in his night-shirt as the way he staggers from it after drinking the bottle of wine. The idea is to make this lower animal seem to act from the human motive, because whatever is out of the natural order of things appeals to Pike imagination. It thrills a crowd to see an elephant walk on bottles, or a woman hang by her heels from a trapeze, because both performances are unnatural and perilous.

Any review of the Pike which does not include an appreciation of the "spieler" would be incomplete. He is the hardest worked man in the business, and the most ingenious. Without him the Pike would lose half its animation and the shows more than half their patrons. He has assurance without grace, wit without delicacy, and a sort of diurnal imagination, which enables him to invent new descriptions of the same performance daily. And his humor is no respecter of persons. Wo betide the wag who attempts to measure speech with him, and the haughtiest, most beautiful woman is not safe from some such exhortation as this: "Lady, you look so fatigued; your color is gone; come in and rest!" But perhaps the most remarkable appeal made is that of a "spieler" before the theater in Old St. Louis. If, after describing the marvelous beauty, grace and suggestive agility of the dancing-girl within, the crowd still hangs back, he pauses, gazes compassionately at the upturned faces below, and exclaims: "You who have no hope of heaven, who have sinned past redemption, you know the pleasures of this world are all you can ever expect to enjoy—therefore, do not deny yourselves this present delight," etc. A score of self-confessed reprobates invariably respond to this invitation with precisely the same air "mourners" sometimes have when they go up at a revival service to be prayed for. A novel and pleasing contrast to these cynical and noisy demonstrations is the silent "spieler" before the Girl of Madrid. Dressed in the costume of a court fool he stands, rigid as a statue, night after night, in the middle of the street, with one guiding finger pointed

Igorrotes in the Philippine Reservation

eloquently at the ticket window of his theater. However, each concession employs a characteristic "spieler," even to the elephant before Hagenbeck's Circus that has the friendly, inquisitive trunk and a cordial disposition to nozzle the crowd with it.

On the whole, the Pike is one of the most interesting features of the Fair, and visitors should not fail to go there, especially the dyspeptic and elderly-minded ones.

NASHVILLE, TENN.

The Public Purpose in Education

BY ARTHUR TWINING HADLEY, LL.D.

PRESIDENT OF YALE UNIVERSITY

IN these days of active commercial enterprise a man who appears before the public as a champion of any theory or system is at once met with the question, "Does it pay?" The educator is confronted with this inquiry as often as any one else—perhaps oftener, because he is using other people's money in channels where the return for its expenditure is not always obvious. Some school and college men complain of this question as unfair, and try to avoid answering it. I believe that it is better to meet it squarely—simply insisting that it be asked intelligently, and that we answer it in its entirety instead of confining our attention to some small part, which is mistaken for the whole. The advocates of higher education have everything to gain by accepting the challenge which it involves. If they will take up this question with care and intelligence they can show that those parts of our school system which are condemned as unpractical or sentimental are often the very ones which from the public standpoint represent the most vital and necessary investment of the nation's money.

There is not much disposition to challenge the usefulness of primary education on the one hand, or of professional education on the other. We may differ somewhat in opinion as to the exact things which should be taught in primary schools or professional schools; but there is very little difference of opinion as to the advantage which such schools confer upon their pupils and upon the community. Even from the narrowest standpoint it can be seen that these parts of our school system are justified by their results. It pays for a child to go to a primary school, because the child must learn to read and write and cipher and be familiar with the fundamental principles of cleanliness and order in order to have a fair start in the race of life. It pays for a man to take a course in a technical or professional school, because a man must know something of the theory of his trade or profession if he wants to make the most money or gain the most consideration in his practice. But with regard to the intermediate parts of our school system—our secondary education given in the high school, the academy, or the college—the matter is more complex. It is by no means clear that the boy who has been to the high school or to the college will always be able to make money more rapidly than he would without the aid of such a school or college course. Still less is it clear that the increase of his money making powers will outweigh the cost of time and capital involved in sending him to school for the period in question. Many of our most successful men complain that our school system does not satisfactorily prepare men and women for the struggles of modern commercial life. The specialist in every career feels the need of having assistants who have learned the routine of his special office as early as possible instead of spending

their time in the schools. The professional man who desires efficient subordinates claims that the three or four years which a boy has spent in college often diminish rather than increase his accuracy of work and his singlemindedness of application. The business man who seeks help in the office or the counting room complains that the high school has taught its pupils very little of those facts or those habits which will be of service to an employer. Even the red bearded Afghan horseman of Kipling's tale, who desires to train his little Irish *protégé* for the secret service of the Indian Empire, sighs with regret at the days spent over the study of surveying and of history in that boarding school, where, as he sententiously observes, they "teach nothing at a long price."

As a result of this widespread mental attitude, there is in many quarters a tendency to undervalue the old-fashioned college or high school education—to shorten the college course in order that the time in the professional course may be extended, and to crowd work into the high school which aims at technical education rather than at the more general education of the olden time. Even those who do not utter the criticisms to which I have alluded or sympathize with the tendencies which they represent are nevertheless compelled to take account of their existence as facts in the educational world, to which it is folly to shut our eyes.

To the question whether, as a matter of dollars and cents, it pays a man to go to college, or even to the high school, I do not conceive that any general answer is possible. It depends almost entirely upon the man. During the years which he spends in non-professional study in these secondary schools he has grown older without earning money or making definite preparations to earn money. The years thus spent make it harder for him to fall into the routine of daily business life. So far they represent a loss rather than a gain in earning power. They give him, on the other hand, the advantage of entering business with greater maturity of judgment and wider knowledge of outside affairs than would have been possible if he had gone from the primary school directly into the office or shop. So far they are a gain. Whether the gain offsets the loss, or whether the gain is enough greater than the loss to pay for the time spent, depends upon differences of individual character. It may be said in a rough way that these years thus spent in secondary study diminish the assurance that a second-rate man will make a second-rate success, but increase the chances that a first-rate man will make a first-rate success.

But this is by no means the conclusion of the whole matter. For the question whether our high schools and colleges pay for what they cost really includes two distinct questions, according as we look at the subject from a narrow standpoint or a broad one. Looked at from a narrow standpoint the question means, "Does a course of education in high school or college enable the student to make enough more money to pay for what that education costs him?" The same question looked at from a broad standpoint would read, "Does the existence of these schools and colleges increase the nation's happiness and prosperity enough to make these institutions worth as much to the public as they cost it?" I plead for this broader way of asking the question. I plead for it all the more earnestly because we are just now in special danger of shutting our eyes to its importance. We live in an atmosphere which gives a man every stimulus to make money, but does not always teach him the importance of making a right use of that money. Our standards of success are based more on what a man can get out of the public—be it wealth or votes or social position—than on what a man gives the public in return. We are prone to accept the theory that the man who can do most for himself without incurring legal penalties or social condemnation is the one who has managed his life with the most intelligence. On Sunday, perhaps, we take a different view; but for the other six days in the week most of us are content to accept in our practice, if not in our theory, the ideals which I have just outlined. This mental attitude is specially characteristic of the present day as compared with any other day, and of our own country as compared with any other country. Self-interest and intelligence have been made to accomplish so much for the public good in the nineteenth

century that people are ready to regard the moral standards of earlier centuries as outworn or superannuated.

With this perversion of moral standards—for, in spite of all that self-interest has done, I do not hesitate to call the morality a perverted one which is based upon this and this alone—there has grown up a certain onesidedness in the development of our power as a nation. It is more certain that an American can run a complex machine than that he can control his own nerves. It is more certain that he can manage a business for his own interests than that he can govern a city in the public interests. Our educational system should be arranged to train us where we are weak, rather than to lay exclusive stress on that in which we are already strong. With the tastes and talents of the American people, I do not believe that there will be any lack of men who can make money—efficient producers and successful traders. The one point of doubt is whether our citizens will learn to use the money thus acquired for the benefit of their country and their fellow men.

If we judge the value of an educational system, not by the way in which it enables each individual to make what current public opinion regards a success, but by the way in which it contributes to the happiness of the community and to the preservation of our institutions, we find in our old-fashioned high schools and colleges certain advantages to the public which cannot readily be computed in money values. If a boy or girl who takes a high school and college course is worth anything at all that course will give to him or to her a far wider range of enjoyments and a far truer appreciation of the real values of different things than would be possible without it. It will give to each man more points of contact with his fellow men. He may not make more money, but he will get more real and permanent satisfaction out of the money that he does make. He may not do a larger business, but he will have a chance to exercise a larger influence in the community. He will be able to place before himself in proper order the different objects of human ambition and to choose, not that which is most obvious nor that which is most dazzling, but that which is best fitted to his talents and enables him to do the greatest public service.

And these words, *public service,* bring me to another advantage which our high schools and colleges offer the community. If properly managed, they train pupils to subordinate their individual ends to the public needs and public demands. A proper reading of history and of literature and of science leads the student to value more highly the work of the inventor who has contributed to the progress of mankind than that of the patentee who has stolen the invention and compelled mankind to pay him a million dollars for the right to use it. It teaches him to value more highly the general who has perished at the head of his army, as a sharer in its hardships and sufferings, than the man who has stayed at home to enjoy the fruits of the peace which this army has conquered for him. It teaches him to value more highly the work of statesmen like Washington and Lincoln, who have subordinated their powers to a public end, than that of men whose chief thought has been to make the public needs subordinate to ends of their own. Not merely by their books do our schools teach this, but by the games on the playground and by the examples of teachers and scholars to one another. If I had to select that part of the work of our school system which is of most essential importance to the country, and which in the largest sense pays the country for the money expended on its education, I should take this training in public spirit.

We are all familiar with the public school of England, and many of us have asked what it is that justifies the use of the name "public school" as applied to an institution like Eton or Rugby. These places certainly have no point of resemblance with the public schools of America, or France, or Germany. They are not free for the people to attend without payment. They are not supported by the people's money. They are not controlled by the people's representatives. They do not teach studies which are of practical use to the great bulk of the people in earning their living. And yet they have well deserved the name, because they gave the kind of education which fitted their pupils to accept public responsibilities and to do public service.

Not so much by the science or the literature that they taught, as by the habits and ideals and standards which they inculcated, did they justify their claim to rank as public institutions. As an antithesis to the Afghan's criticism of higher education, which I quoted a few sentences ago, I cannot do better than present that noble justification of the life of the English public school boy which Kipling has given us in another book, and this time out of his own mouth:

"He won his growth and chest measurement, and a few other things that did not appear in the bills, under a system of cricket, football and paper chases five times a week. Above all, he was responsible for that thing called the tone of the school, and few realize with what passionate devotion a certain type of boy throws himself into this work. Home was a far away country, full of ponies and fishing and shooting, and men-visitors who interfered with one's plans; but school was the real world, where things of vital importance happened, and crises arose that must be dealt with promptly and quietly. Not for nothing was it written: 'Let the Consuls look to it that the Republic takes no harm,' and Georgie was glad to be back in authority when the holidays ended. Behind him, but not too near, was the wise and temperate Head, now suggesting the wisdom of the serpent, now counseling the mildness of the dove; leading him on to see, more by half-hints than by any direct word, how boys and men are all of a piece, and how he who can handle the one will assuredly in time control the other. . . . He did not know that he bore with him from school and college a character worth much fine gold, but was pleased to find his mess so kindly. He had plenty of money of his own; his training had set the public school mask upon his face, and had taught him how many were the 'things no fellow can do.'"

This last phrase, to which Kipling more than once recurs, is the key to the whole situation. The boy had learned self-restraint—a kind of self-restraint which was not enforced by the authority of masters in school, nor dependent upon the authority of courts and policemen out of it—but a self-restraint voluntarily accepted by the school boy and by the man into which the school boy afterward grew. He had learned that there were things that no fellow can do, not because those things would land him in prison or would prevent his making money, but because they would interfere with his self-respect as a member of a self-governing body. It is just because the English public schools taught this thing that they did their public work well. The English nation, for the sake of having this thing done well, has been willing to condone many faults and deficiencies in the kind of training which these schools give in preparation for the various callings and duties of private life. And, on the whole, I believe the English nation has been wise in taking this view.

For this training, after all, is what constitutes a liberal education. A great deal of misunderstanding as to what our schools and colleges ought to offer has arisen from a wrong use of this word *liberal*. We are so accustomed to use it in the current sense of *large* that we often forget that it has another and better meaning. We instinctively think of phrases like a liberal offer for a house, a liberal salary for a man's work, or even a liberal dinner for twenty-five cents; and we think that a liberal education is to be interpreted in the same way, as one which is large in quantity. This is not the true meaning. The word *liberal* as applied to education means a training which fits the student for liberty. It is not liberal in the sense of being unrestricted; it is liberal in the sense of being a preparation for citizenship. Technical education is valuable for slave and freeman alike—perhaps even more so for the slave than for the freeman, because the total utility of the slave is represented by what he can do for his employer. Liberal education is necessary to enable a man to be a member of a self-governing body. The old Persians of the free or self-governing class had a liberal education in those schools described by Herodotus, where they were taught to ride, to shoot, and to speak the truth—not so very different a course, after all, from that of the English public school as described by Kipling, nor from that of the American college as it affects some of its best men if they have no taste for classics and mathematics, but much for the respect of their fellows and for the traditions that maintain the honor of a gentleman.

I do not mean that we ought to keep unchanged the old-fashioned course in classics and mathematics. We could not

do it if we would, and we ought not to wish it if we could. I am not making an argument for the study of the classics, but for the preservation of the spirit which went with that study in the schools of olden time; a spirit which some of our modern schools, with their better appliances and more attractive course of study, are in danger of losing. For the pursuit of utility as the object of education carries with it certain insidious dangers. It leads the teacher to think that the course of study should be based upon what the pupil desires rather than upon what the country needs. Where this spirit prevails there is a tendency on the part of some teachers to make studies attractive instead of trying to compel the pupil to work, and a tendency on the part of almost all teachers to lay stress on the specific sets of facts which are supposed to conduce to the success of the pupil in after life, rather than upon other facts and principles equally important but not, in the narrower sense of the word, equally profitable. The school that tries to make its studies attractive, whether it be in the kindergarten or in the university, secures temporary pleasure at the expense of intellectual discipline and intellectual efficiency. The school which tries to make studies profitable in the pecuniary sense loses that wider possibility of profit which results from the inculcation of high ideals and the development of moral standards. The old-fashioned classical course, whatever its defects, was not subject to these specific dangers. The new courses, whatever their merits, are subject to them in great degree. If we can recognize that these are real dangers and that the pursuit of utility, instead of being an unmixed advantage, is too often a snare and a delusion, then, and only then, can we hope to broaden our course of study in such a way as to meet the needs of the present and yet preserve the essential excellences of the past. The recognition of the paramount importance of the public purpose in education will not result in throwing us back upon old-fashioned courses of study, but will enable us to make with safety experiments in modernizing our schools which otherwise would be fraught with peril.

The American college of generations past has had many points of resemblance to the English public school. It has given the same training in social and moral standards of public service; it has had somewhat the same faults and deficiencies as a place for laying the foundations of private success. These deficiencies we are trying to make good. It is important that we should do so; but I believe it to be yet more important that we should preserve the old social and moral standards which make the citizen fit for self-government in a free commonwealth. And I believe that in our best American schools and colleges this fundamental purpose has been preserved amid the many alterations of external form which have taken place. There is no doubt that in all these externals our colleges have changed very widely. Their appointments are more complete. Their interests are more varied. They no longer aim to force all their students through a single curriculum, where human learning is divided into such small pieces that few of the fragments possess nutritive value or individual pleasure. They give to the pupil a wide choice of electives and a wide possibility of consulting his own individual taste in matters of study. But amid all these changes there are two things which to-day, as in generations past, I think are characteristic of most of our colleges, and which I am sure are characteristic of the college which I know best. On the intellectual side they aim to give their pupils a chance to decide how they can best serve the public —in what work they have the best prospect of honorable influence for themselves and full performance of their duties to their fellow men. On the moral side they subject the student to a set of influences which tend to take him out of himself, and make him feel that he is a part of a community to be served loyally and unselfishly, wherein each member can take more pride and pleasure in his contribution to the success of the whole than in the attempt to lay that whole under contribution to his own success. It is this public spirit which distinguishes the true college or university from the group of professional schools. The men may be studying different things, but they are studying them under surroundings which tend to broaden the man rather than to

narrow him. It has been well said that a university is not a school, but an atmosphere. The man who lays within university walls the foundation for his business or profession learns to do it under influences that widen his mental horizon rather than narrow it; that bring him into sympathy with as many kinds of men as possible; that lead him to measure his work by the standards which have held for all time, rather than by those of a single generation or a single profession. It is not that the university man knows more than his fellow men. He very often knows less. Those who are sure that they know the most on account of having been to the university are the very ones that are likely to know the least. But university life means for every man that has properly come under its influence that he has different means of enjoyment and different standards of success from those which would have been at his disposal without it. And what is true of the university is true in its way of every good high school or academy. Every such place should give to the pupils a certain ethical impress which the traditions and the standards of the place have created, and which will probably be more important in the long run than the specific facts that they have learned, or even the specific principles they have mastered.

If the school or college does this it subserves a public purpose. If it fails to do this its purpose is essentially a private one. I would not for one instant underrate the value of a good technical school; but if it is a technical school and nothing else, it is, in my opinion, not justified in appealing for public money or charitable endowment. It is business, and it deserves to be subsidized only to that extent to which any new and somewhat experimental business may properly ask for temporary subsidy. But if it instills into the minds and hearts of its pupils things which will not bring a commercial return to them as individuals, but which promote the welfare of the community without reference to individual profit, and perhaps at the cost of individual self-sacrifice, then the matter stands on another footing. It is a vital necessity for every free community to train the members of the coming generation for the proper use of freedom as a means of public service, instead of allowing them to believe that the sum and substance of a man's life is to get all that he can out of his fellow men. So far as they fulfil this public purpose, our public schools and colleges can properly appeal to the Government for money, and our private schools or colleges can ask for gifts and endowments from their friends. When they fail to do this they fail alike of their public purpose and of their claim for public support.

NEW HAVEN, CONN.

Progress of Collegiate Track Athletics

BY WALTER CAMP

[Mr. Camp, as our readers know, is perhaps the leading authority on collegiate sport in this country. He is easily our foremost football expert, and holds the position of graduate adviser in athletics at Yale University.—EDITOR.

THE triumph of the American collegians in the Yale-Harvard Oxford-Cambridge contests last week at Queen's Club, London, marks the first time in five of these international contests between American and English collegians that the visiting team has been able to win the majority of the events.

Coming, as it does, immediately after the victory of Mr. Travis over the English and Scotch golfers in the amateur championship of Great Britain, it has added much to the respect of the Englishman for the prowess of athletes from the States.

In nothing more than in golf and track athletics has the very marked progress of Americans in taking up enthusiastically all forms of athletic sports been more in evidence.

The first American intercollegiate track athletic games were held at Saratoga in 1876, and at that time the 100-yard dash was won in 11 seconds by Stevens, of Williams. In that same year in the Oxford-Cambridge games the 100-yard dash was won in 10 1-5 seconds, so that we here find the American four-fifths of a second behind his English rival. In the first of the international intercollegiates, so-called (for it should be borne in mind that a really international intercollegiate track contest, where the best representatives of all the colleges in both countries have competed has never yet been held, these international events being confined thus far to but four, Oxford, Cambridge, Yale and Harvard), held in 1894, the 100 yards was won by C. B. Fry, of Oxford, in 10 2-5 seconds. In the next international, in 1895, W. W. Richards, of Yale, won in 10 1-5 seconds. In 1899 F. J. Quinlan, of Harvard, won in 10 seconds. In 1901 N. H. Hargrave, of Yale, won in 10 2-5 seconds, but the race was over 105 yards, owing to a mistake made by the contestants as to the starting line. The victory, therefore, of W. A. Schick, of Harvard, in the recent contest, with 9 4-5 seconds, is the best that has been done in the international meets. The incomparable Duffy, of Georgetown, however, made a record at the American intercollegiates of 9 3-5.

Something of the same progress, only in a more marked degree, appears in the other events. In 1876 the 120-yard hurdle was won in 18½ seconds by Wakeman, of Yale. That same year, in the Oxford-Cambridge games, the time was 16 seconds flat. But three of the five international contests have been won in better time than 16 seconds, and only one of them, the first, in 1894, took over 16 seconds. In that year Oakley, of Oxford, won in 16 3-5 seconds, but it was the only win in this event that the Englishmen have scored; Cady, of Yale, and Hatch, of Yale, winning the two hurdle events in '95, one being run on the track and the other on the grass, each doing 16 seconds flat; Fox, of Harvard, winning in '99 in 15 3-5; Converse, of Harvard, in 1901, in 15 3-5, and Clapp, of Yale, this year in 15 4-5. In the Yale-Harvard intercollegiate contest this year this event was won by Clapp, of Yale, in 15 3-5 seconds, but that wonderful American runner and jumper, Kraenzlein, of the University of Pennsylvania, holds the record at 15 1-5 seconds for this event.

Still greater progress comparatively has been made by Americans in their quarter mile run, for in this event in the intercollegiates in '76 it took Stevens, of Williams, 56 seconds to win it. The Englishmen in the Oxford-Cambridge games of '76 took 52 2-5 seconds, but in the five international meets the quarter has been won in over 50 seconds only once, and that was in 1894, by Gordon, of Oxford, in 51 seconds. In 1891 Lewin, of Cambridge, won in 49 4-5. In 1899 Davidson, of Cambridge, in 49 2-5, and in 1901 Rust, of Harvard, in 50 seconds and in 1904 Dives, of Harvard, in 49 4-5.

Taylor, of the University of Pennsylvania, the colored runner, set up a new American intercollegiate record this year at Philadelphia, by covering the distance in 49 1-5 seconds.

The mile was won in the first American intercollegiates by Stimpson, of Dartmouth, in 4 minutes 58 seconds. That same year in the Oxford-Cambridge games the distance was covered in 4 minutes 29 1-5 seconds. In 1895, in the internationals, Lutyens, of Cambridge, won in 4.35; in 1899 Hunter, of Cambridge, in 4.24; in 1901 Cockshott, of Cambridge, in 4.26 1-5, and this year Gregson, of Cambridge, in 4.21 1-5. The best that has been done at the American intercollegiates has been 4 minutes 23 2-5 seconds, by Orton, of Pennsylvania.

The high jump was won in the first American intercollegiate with 5 feet 2½ inches, Pryor, of Columbia, clearing this phenomenal (?) hight. That same year the Englishmen in the Oxford-Cambridge games did 6 feet 2½ inches, and no one in the internationals has beaten that, altho three out of the five have been won with 6 feet or over. In the first, in '94, Swanwick, of Oxford, and Sheldon, of Yale, tied at 5 feet 8¾ inches. In '95 Thompson, of Yale, won with 5 feet 8¼; in 1899 Rice, of Harvard, won with 6 feet; in 1901 Spraker, of Yale, did 6 feet 1½ inches, and this year Vietor, of Yale, with 6 feet ⅛ inch. Windsor, of the University of Penn-

sylvania, set the American intercollegiate record at 6 feet 3 inches. But M. J. Sweeney, in the contest between the London Athletic Club and the New York Athletic Club, in New York, cleared 6 feet 5⅜ inches.

In the broad jump at the first intercollegiate Willoughby, of the University of Pennsylvania, won with 18 feet 3½ inches. The same year the Oxford-Cambridge distance was 21 feet 8½ inches. In the internationals the records have been: Sheldon, of Yale, in 1894, 22 feet 11 inches; Sheldon, of Yale, 1895, 21 feet 4½ inches; Vassall, of Oxford, in 1899, 23 feet; Spraker, of Yale, 1901, 22 feet 4 inches, and this year Sheffield, of Yale, 21 feet 10¾ inches.

The half-mile has not been common in these meetings, nor has the two-mile. Some comparison may be made, however, from the fact that the half-mile was won in 2 minutes 16½ seconds by Green, of Princeton, at the first American intercollegiate in 1876, whereas Holding, of Oxford, in the present international, covered the distance in 1 minute 56 1-5 seconds, and Kilpatrick, of Union College, on the occasion of the London and New York Athletic Club meet in New York, made a record of 1.53 2-5.

The general conclusion from these figures would be that if the Americans make the same progress in distance running that they have in the shorter sprints, there is some hope of their overtaking the Britisher, even in these endurance contests, but at present the English distance runners in the college ranks stand well above the American collegian, both in quality and quantity.

George Frederick Watts, B.A.

BORN 1820—DIED 1904

BY ALFRED AUSTIN

Poet Laureate of England

I.

Loved and Revered. What more than this,
Of sounding glory, silent bliss,
Can crave or win the noble Mind
That works to stimulate mankind,
To find the God within the shrine,
And in the earthly the Divine;—

II.

That makes the bare blank canvas glow
With splendid joy or pallid woe,
Transmits to after years the grace
Of maiden form and manly face,
With unextinguishable fire
Shows sons how lived, how looked their sire,
And limns with sympathetic hand
The features of the Mother Land;—

III.

That with strokes strenuous and fierce
Can through the quarried marble pierce,
And, gazing deep within it, make
A sleeping loveliness to wake
And live, when all beside grows old,
A youthful glory to behold?

IV.

Such like was He whom you may find
Within this silent urn enshrined.
Approach and read. A date, a name,
A little dust, a lasting fame.

Ashford, Kent, England.

The Club Which Helps with the Moral Standard of the Camp

The Vacation Camp for Boys

BY EDWIN DE MERITTE

THE summer camp for boys has now become an important factor in boy life. Where the conditions are favorable, and the aim of the camp is in the right direction, the boys derive a lasting good. The life is an outdoor one. It may be made of great practical value and a pleasant memory to all concerned.

In this article I propose to speak of the private camp, tho there are many philanthropic camps which are doing a good work and maintain a high standard.

The leader of the camp must be a man of sterling character, long experience, and thoroughly interested in boy life. His aim should be to develop all that is best in the boy. Most boys have some trait which is a hindrance to success—selfishness, indolence and the like. It is the duty of the camp leader to discover these by carefully watching the boys, and to strive to eradicate them, not by harsh measures, but by kindly showing to the boy the harm to himself, and by leading him by personal effort and example to overcome them. He must be ever vigilant, alert, and work for the best interests of the boys. This work he should not delegate to others. He alone is responsible to parents for the safe return of the boys to their homes, stronger in character, stronger in moral ideas and stronger physically. He must be with his boys at all times. He must advise, guide, direct.

Unless he is ready to do this and to give his entire time to the work, he is not a suitable person to take the responsibility.

The equipment of a camp is an essential feature. To start a camp, with the necessary equipment, requires an invested capital of from $3,000 to $10,000, according to the size of the camp. The number should not be so large that the leader cannot keep in close contact with the boys individually. The dining-room, kitchen, refrigerator and ice house, dormitories, a main building containing a large assembly rom with a generous fireplace, trunk and dressing rooms, a suitable boat-house

with boats and canoes, and a wharf, all cost money. The kitchen and dining-room should be under the charge of a competent cook and his assistants. This work should not be required of the boys. The dormitories should be equipped with comfortable beds. The use of large, well ventilated dormitories keeps everything dry and healthy and is better on every account than a tent. It keeps the camp a unit and prevents the forming of cliques within the camp.

A dressing-room, separate from the dormitory, is necessary, as the boys are not then required to sleep in the room where the clothing worn during the day is hung. Table etiquet should be insisted on.

The selection of boys is important. If by any chance any boy should be admitted who should exert an influence detrimental to the moral standard of the camp he should be sent home at once and the balance of his tuition refunded. Every boy in camp must have equal rights with the others, except where the strength, skill and superior judgment of the older boys might permit them to undertake feats of strength which would be harmful to the younger boys. All athletic work should be under careful supervision.

The daily work of the camp may vary according to the plans on which the camp is founded. System and regularity in all things is a necessity. The following arrangement is a good one and may be changed to suit the changes of the weather or the plan of the camp. Rising at 6.40, a five minute dip in the lake and a vigorous rub down give the boys a keen appetite for a 7 o'clock breakfast. After breakfast each boy makes his own bed and puts things in order in the trunk room. Then comes the policing of the camp. This is a necessity. By it neatness and cleanliness are taught, and the camp is always in a presentable condition. This can easily be accomplished by dividing the camp into squads, one for each day of the week, with a counselor at the head of each squad. In this way each boy is on duty only one day in each week, and the duties rarely occupy over an hour each day.

Next, all study, when required, and recitation work should be done in the morning hours, that the afternoon may be left free for the outdoor life. For those who do not study the opportunities for nature study are many and varied and may be carried on with system and with excellent results, or the boys may engage in athletic training. Rowing, canoeing, tennis and a variety of other athletic sports should always be available.

Ready for the Mountain Trail

Junior Dormitory

At 10.30 free hand gymnastics, consisting of simple exercises to keep the muscles pliant and to strengthen those of the back, abdomen and side walls of the body, as well as the legs and arms, will be found very beneficial. At 11 o'clock a fifteen or twenty minute swim, not longer, will be found healthful and invigorating. This may be repeated with safety between 4 and 5 P. M. If the camp is near fresh water a long period in the water must be avoided, as it is enervating and may produce injurious results. Young boys should never be allowed in the water except at fixed times and under the watchful care of strong and expert swimmers. During the swimming period the boys should be taught the different methods of swimming for speed and for distance, how to dive properly, and the

The Start for the Evening Paddle

proper method for the rescue of a person in the water. They should be trained to become fearless in the water and to be ready for any emergency.

At 12 o'clock they will be found ready for a good, substantial dinner. After dinner they should be allowed to lie down and rest for an hour. In many cases this is almost a necessity, so vigorous is the life. After the *siesta* baseball, tennis, mountain climbing or tramps afield may occupy the time until the swimming hour or even until supper time. After supper a variety of outdoor sports may occupy the time until darkness prevents. Then the assembly room, with the opportunities for music, singing, or practical talks. By 9 o'clock the camp should be in bed and asleep.

A well selected library and letter writing will occupy the time on rainy days and prove of value.

Sunday should be maintained as a day of rest. At 10.30 A. M. a short service may be held, which consists of reading from the Scripture, the singing of hymns, and practical talks on subjects of vital importance to the boys.

The number of camps has greatly increased during the past few years. There is room for all, provided they are planned to elevate the boy. Doubtless some are planned to tide over the period between college and the profession. Others are planned and conducted on the money and amusement basis, while some are planned by earnest men for the good of the boy. The man who plans his camp on the latter basis will not have to go out in search of boys. The boys will come to him. The sharp rivalry among amateurs in building up a camp, and even among some of the older ones, is an injury to the work. The sharp business practices employed to secure boys at the expense of other camps mark the man and his camp as an association and a place where the boy will receive no good, and give opportunity for the remark quoted at the beginning of this article, and moral injury may result.

Main Building and Junior Dormitory

Should more boys go to camps? Most emphatically, yes. Boys who must stay at home during the vacation periods drift during the summer. Their associates are away. Therefore, the boy finds amusements for himself, often with a class of boys who are not always desirable. This is always possible, often dangerous. The boy must have something to occupy his time and does not always discriminate, provided he has his amusement.

The camp also should be a safer place for boys than the summer hotel, where the selection of associates and the careful discrimination as to character is well-nigh impossible until after the harm is done. Boys are taught self-reliance, self-respect and to respect the rights of others. They are taught the value of harmony,

unity of action and loyalty. They are encouraged to think of the future and to form plans early for future usefulness, and to bend their energies to the accomplishment of some definite object. They are taught to be courteous and gentlemanly in dealing with their associates.

To the camp conducted on the proper basis the same boys return year after year. To some camp boys return for three, four, five, six and even seven years, so attached are they to the camp and so much do parents appreciate the value of the camp influence.

In this article I have endeavored to set forth the general plan of camps which have attained sucess. By following out this plan, varied to suit the conditions, but always with the one idea—to develop manly boys, truthful, honest and self-reliant—the summer camp will attain the place which it should hold in the public mind, and the standard of American boyhood will be raised.

CAMP ALGONQUIN, HOLDERNESS, N. H.

Educational Books: A Brief Survey

IN accordance with our usual custom we give in this number a list of some of the more important school books published during the year. Space will not permit of thorough reviews, but the critical comments appended are designed to give a sufficient idea of the character of the works to enable a teacher to determine what of them he needs to investigate. The choice of a textbook depends so much on the personal methods of the teacher and the conditions under which he works that it is impossible to assist him more than by extending the range of this choice. A textbook is like a suit of clothes, the one that fits the wearer is the best for him. It should be understood that the present list is merely supplementary to the many educational books to which we have given special reviews during the year.

English

Standard English Classics. Essays of Lamb, by G. A. Wauchope, 50 cents. Macaulay's Life of Johnson, by C. L. Hanson, 25 cents. Irving's Goldsmith, by C. R. Gaston, 50 cents. Tennyson's Idyls of the King, selected by Willis Boughton, 25 cents. Boston: Ginn & Co.

Dickens's Christmas Stories. By Jane Gordon. New York: American Book Co.

Hawthorne's Wonder Book for Girls and Boys. New York: E. P. Dutton & Co. $1.50.

Rolfe's Shakespeare. Macbeth, Twelfth Night, Hamlet, King Lear, Othello, The Tempest, Midsummer Night's Dream, As You Like It, The Merchant of Venice. New York: American Book Co. 50 cents.

Modern English Prose. Selected and edited by G. R. Carpenter and W. T. Brewster. The Macmillan Co. $1.00.

Macaulay's Life of Johnson. By A. P. Walker. Boston: D. C. Heath & Co. 25 cents.

The Gateway Series. Edited by Henry Van Dyke. Burke's Conciliation with America, by Wm. Macdonald, 35 cents. Carlyle's Burns, by Edwin Micus, 35 cents. The Merchant of Venice, by F. E. Schelling, 35 cents. Silas Marner, by W. L. Cross, 40 cents. Macaulay's Milton, by E. L. Gulick, 35 cents. New York: American Book Co.

Riverside Literature Series. Edited by Bliss Perry. Irving's Goldsmith, by Willis Boughton, 45 cents. Boston: Houghton, Mifflin & Co.

Macaulay's Milton and Addison. By J. A. Tufts. New York: Henry Holt & Co.

The Making of English. By Henry Bradley. New York: The Macmillan Co. $1.00.

Forms of English Poetry. By Chas. F. Johnson. New York: American Book Co. $1.00.

Elements of English Composition for Secondary Schools. By T. F. Huntington. New York: The Macmillan Co. 60 cents.

Everyday English for Grammar Grades. By Jean S. Rankin. Boston: Educational Publishing House. 50 cents.

THERE is such a lack of agreement about the teaching of English that it is pretty difficult to find a point of view from which to criticise such texts and readings as may get themselves published from to time. It seems safe to say, however, that the sense for literature, which all agree upon as the desirable end, cannot be aroused or cultivated on the basis of a single piece or even of a single author, or, for that matter, of a single period. Literature is a specific which must be taken in large doses to do any very great good.

With respect to the mere article of variety, indeed, the publications of the year offer very little opening to adverse criticism. Seldom, in fact, has there been so great a number of titles. But to the rather imposing array there wants that single eye for the highest excellence

which is so very essential in such a matter. There is not a single introductory essay of genuine critical merit, of the sort that ought to furnish out our reading texts; the nearest approach to it, tho at something of a remove still, being probably the remarks prefixed to Lamb's Essays, while in the choice of authors it seems as tho the present disposition to compromise between amusement and edification were likely to destroy all serious literary discipline for some time. In this regard the elementary texts are naturally in the worst case—so much so that one is almost justified in the paradox that any book is better for children than one made for their use. For this reason it seems safest to prefer some such carefully prepared volume as this of Dickens's *Christmas Stories,* while Hawthorne's *Wonder Book* may be looked upon as an exception, both in itself and in its present attractively illustrated shape. Unfortunately, however, this literary laxity is by no means confined to the provision for youth, but extends even to the advanced readings. There is, of course, the usual disproportionate display of Shakespearean texts, among which should be noticed the reissue of Dr. Rolfe's well proved edition of Shakespeare, in a rather handier form and with the convenient excision of textual variants and such other matters as are now more properly and easily available elsewhere, together with a thorough revision of the commentary to suit the present state of educational thought. But, outside of this eminently safe name, the titles are scattering and haphazard, as tho there were no consensus of opinion in regard to what is either classic or essential, as is indeed the case. A good deal of this scatteration is probably due to the assignments for admission to college, which are to every appearance utterly unsystematic and planless—but not all of it, as is curiously illustrated by Carpenter and Brewsters's *English Prose.* In its way the book seems likely to be useful, for the selections are numerous and comprehensive. But tho they may supply valuable illustrative material for rhetorical demonstrations, they are too short to be of much assistance in the cultivation of a literary taste and habit, and are, indeed, singularly chosen. There is Gibbon, but no vestige of Burke, while Hamlin Garland, James Lane Allen, Maurice Hewlett and Jack London are huddling side by side, as tho to keep each other in countenance in the immediate vicinity of Hawthorne and Scott, to say nothing of a bit of collaboration on English words by Greenough and Kittredge cheek by jowl with Matthew Arnold's "Sweetness and Light." At the same time it is reassuring to see an awakening of interest in the eighteenth century, at first and second hand, in creditably edited editions, among others, of Macaulay's *Life of Johnson* and Burke's *Speech on Conciliation with America.* The former, by A. P. Walker, has a rather promising manner of presenting explanatory matter, not in the usual mode of note and dissertation, but by means of plans, tables and the like easily intelligible exhibits; while the latter includes a plain sufficiency of notes and a clear statement of the political situation by a professor of history, which innovation begins to look a little like a happy reconciliation between literature and general thought. There is, besides, an *Irving's Goldsmith* by Dr. Boughton, admirable, like the other members of its series, for its cheapness, its typographical neatness and its freedom from editorial lumber—in short, for its readableness.

Besides these reading-texts there are one or two other books, amid a strange dearth of "literatures," which deserve some notice. Among them is a popular and interesting sketch of the development and characteristic peculiarities of the English grammar and vocabulary, very suitable for general reading or study, by Dr. Bradley, one of the editors of the Oxford Dictionary. Professor Johnson's *English Poetry,* too, promises well in its kind. It contains a careful account, fully illustrated by well chosen quotations, of the several species of English verse, with some small reference to their historical development, tho what constitutes the merit of the book is rather the fact that it is written appreciatively and is animated by a thoroughly literary spirit. Among the rhetoricians in general there is still altogether too much insistence upon original writing on the part of those of tender years. It is certainly very doubtful indeed whether Mr. Huntington, who is one of the most forward with his opinion, is likely to do so much good as harm in asserting that every one, chil-

dren included, should be made to form the writing habit at the start, as he is certainly wrong in assuming "an abundance of fresh and entertaining ideas" to be in widest commonalty spread. But in the way they are taking it is at least encouraging to see them recognizing the importance of thought to composition and the necessary connection between reading and writing. Perhaps the most commendable book of this sort is *Everyday English*. There seems a rather unnecessary amount of verbal condescension about it, an excessive precaution to scale the language and the selections down to the pupils, rather than the pupils up to literature; but the constant accompaniment of precept with example and the consequent stress upon subject-matter is very well.

French

Fifty Fables. By La Fontaine. Edited by Kenneth Mackenzie. 40 cents.
Le Petit Robinson de Paris. Par Mme. Eugene Foa. Edited by Louise de Bonneville. 45 cents.
New York: American Book Co.
Ramuntcho. By Pierre Loti. Edited by C. Fontaine.
La Cagnotte. By Labiche et Delacour. Edited by W. C. Farnsworth.
Boston: D. C. Heath & Co.
La Mare au Diable. By George Sand. Edited by Leigh R Gregor. Boston: Ginn & Co. 35 cents.
Corneille's Horace. Edited by John E. Matzke.
Le Roman d'un Jeune Homme Pauvre. By Octave Fuillet. Edited by James D. Bruner. Boston: D. C. Heath & Co.
Colomba. By Prosper Mérimée. Edited by H. P. Williamson. New York: American Book Co. 40 cents.
Chateaubriand's Les Adventures du Dernier Abencerage. Edited by Victor E. François. New York: Wm. R. Jenkins. 25 cents.
An Easy First French Reader. By L. C. Syms. New York: American Book Co. 50 cents.
A French Reader. By Fred. D. Aldrich and Irving L. Foster. Boston: Ginn & Co. 50 cents.
En Voyage. By T. M. Clark. New York: William R. Jenkins.
Beginner's French. By Victor E. François. New York: American Book Co. 65 cents.
Commercial French. In two parts. By W. M. Poole, M.A., and M Becker. $1.50.
Grammaire Française. By W. M. Poole, M.A., and M. Becker. 60 cents.
Intermediate French Grammar. By G. H. Clarke and L. R. Tanguerey. $1.00.
New York: E. P. Dutton & Co.
Gasc's French Dictionary. By F. E. A. Gasc. New York: Henry Holt & Co. $1.25.

Fifty Fables of La Fontaine may interest a class of children who are studying French at leisure, but it will hardly satisfy the average high school class, who, after having read ten or fifteen of them will prefer to seek new and harder worlds to conquer. An easy book that can be started after a half year's study of French grammar is *Le Petit Robinson,* a dog-story, simply and gracefully told, which will win the hearts of the youth. The Academicians are contributing their quota to the classroom. Loti's *Ramuntcha,* a story of love among the Basques, is marked by the qualities that dominate his work, a melancholy amounting almost to pessimism, a poetry instinct with ideality. For full appreciation the book may best be left to the higher classes, where sensitiveness to finer literary qualities is more developed.

From Loti to Labiche is a far cry, indeed, the one a painter of moods of sadness, the other a bold, genial humorist with a strong grasp of the comic sides of *bourgeois* life. *La Cagnotte,* written as Labiche wrote all his plays, in collaboration, is one of his most successful comedies.

Horace is another one of his which has been found adaptable for class use. Its subject, the combat of the Horatii and the Curiatii, is a most stirring and appealing one, and gives room for Corneille's classic majesty and strength.

The three great romanticists who follow have proved their success as authors for the class. George Sand's *La Mare au Diable* exhibits her in her third phase, no more the passionate advocate of true love, no more the iconoclast of forms, but the simple, poetic soul, fascinated by the calmness and beauty of French peasant life.

Feuillet, a romanticist of a widely different type, is the creator of the Romanesque character, the gentleman of honor. His famous *Roman d'un Jeune Homme Pauvre* has had a favorable reception in school circles. Equally true is this of Mérimée's *Colomba,* a tale of the Corsican vendettas, in the realistic vein of one of the most perfect of the French school.

A paper edition of *Les Aventures du Dernier Abencerage,* dealing with one of the Moorish tribes that had been driven from Spain after the conquest of Granada, is well annotated and contains a convenient vocabulary. The subject, treated in the magnificent style of Chateaubriand, is nevertheless questionably interesting to the average student, principally on account of its historical difficulties.

En Voyage is supposed to teach conversation to tourists and classes. The artificiality of such books is apparent to

every teacher. The *Beginner's French*, by one of the best known French teachers in the secondary school, is a distinct advance upon the older French grammars. Unlike Chardenal's, which, tho simple, is dry, or Fraser and Squair's, which is too complex, it seeks the golden mean of interest and simplicity. Its method is a progressive one.

In view of the recent tendency to make commercial studies prominent, the *Commercial French* is an interesting textbook. More of a reader than a grammar, it combines unusually well-chosen selections with practice in conversation.

German

Bunte Geschichten. By Erna M. Stoltze. 30 cents.
Kinder - und Hausmärchen. By the Brothers Grimm. Edited by B. J. Vos. 45 cents. New York: American Book Co.
Gerstäcker's Germelshausen. By Griffin M. Lovelace. Boston: Ginn & Co. 30 cents.
Campe's Robinson der Jüngere. By C. H. Ibetshoff. 40 cents.
Baumbach's Das Habichts fraülein, Edited by Dr. Wilhelm Bernhardt.
Hoffman's Das Gymnasium zu Stolpenburg. Edited by V. Buehner. 35 cents.
Storm's Pole Poppenspäler. Edited by Dr. Wilhelm Bernhardt. 35 cents. Boston: D. C. Heath & Co.
Favorite German Poems. Edited by J. H. Dillard. New York: American Book Co. 60 cents.
Shorter Poems of Goethe and Schiller. By W. H. Van Der Smissen. 60 cents. New York: D. Appleton & Co.
Schucking's Die Drei Freier. By Otto Heller. 30 cents. Boston: Ginn & Co.
Werner's Heimatklang. By M. P. Whitney. New York: Henry Holt & Co.
Lessing's Minna von Barnhelm. By A. Minckwitz and A. C. Wilder. Boston: Ginn & Co. 45 cents.
Goethe's Egmont. By James Taft Hatfield. 60 cents.
Goethe's Hermann und Dorothea. By W. A. Adams. 65 cents.
Goethe's Das Märchen. By Chas. A. Eggert. 30 cents. Boston: D. C. Heath & Co.
Wagner's Die Meistersinger von Nurnberg. By W. P. Bigelow. 70 cents. New York: American Book Co.
A Chronology and Practical Bibliography of Modern German Literature. By John Scholk Nollen. $1.00. Chicago: Scott, Forseman & Co.
A German Reader, with German exercises based upon the text for first reading in German. By William Herbert Carruth. 55 cents.
Ford's Elementary German for Sight Translation. By R. C. Ford. 25 cents. New York: Ginn & Co.
German Composition. By B. Mack Dresden. 40 cents. New York: American Book Co.
Exercises in German Conversation and Composition. By E. C. Wesselhoeft. 50 cents. Boston: D. C. Heath & Co.

THE new editions of German books for school use continue to pour in, as if their editors were determined to make up for their long enforced silence and inactivity in the days when their classic brethren held the field. It is, indeed, a hopeful outlook for the high school youth that the reading of interesting texts is being pushed to the front, and grammar for grammar's sake is being relegated to the rear.

Introductory books for the first and second year—their name is Legion! Passing by some of the better known elementary works, as the *Bunte Geschichten* of Miss Stoltze, a favorite beginner's book, and the deservedly popular *Kinder - und Husmärchen* of the Grimm brothers, we may linger for a moment with Gerstäcker's *Germelshausen,* that dreamily mystic, fancy nourishing tale, and hope that it is extending its sphere of pleasure-giving.

Some additions will be welcomed by every teacher: *Robinson der Jüngere,* the German "Crusoe"; *Das Habichts-fraülein* of Baumbach, the bard of Meiningen, to whom we owe those graceful tales of Thuringian woodland life; *Das Gymnasium zu Stolpenburg,* consisting of two stories, one, *Die Handschrift A,* of a student absorbed in the Nibelungen problem—*Pole Poppenspäler,* another of those delicate, almost fantastic and fairy-like tales of Storm, that bids fair to equal in popularity his "*Immensee.*"

Among collections of German poetry, Dillard's *Aus dem deutschen Dichterwald* is one of the most praiseworthy, for choice of poems, grouping and judicious annotation. A more ambitious work of the Twentieth Century Series, edited for a higher class of students, is *Shorter Poems of Goethe and Schiller.* This beautiful volume contains an unnecessarily complete bibliography on the subject of their poetry. Especially valuable is the literary analysis of each poem.

Die Drei Freier of Schucking, the Walter Scott of Westphalia, is a *novelle,* combining into one the legends of the Wandering Jew, the Wild Huntsman and the Flying Dutchman. An obstacle to the enjoyment of this spirited narrative is introduced in the archaisms and linguistic peculiarities of the author's style. For a quick, uninterrupted reading, Werner's *Heimatklang* is good. A lively story of the time of the Schleswig-Holstein War, it gives a clear picture of German life from the pen of a popular German novelist. An innovation among textbooks is an edition of Wagner's *Meistersinger von Nurnberg.* We are pleased to note this. Wagner has always seemed to us peculiarly adapted to the last years of a college course, for his simplicity of poetic and dramatic con-

struction, for the beautifully lyric quality of his verse and for his romantic subjects.

Carruth's *German Reader* is the most comprehensive textbook of its size that we have seen, for it includes six complete stories, forty poems, notes, exercises and vocabulary, printed in good type in one small volume. The selections are admirable; hero and fairy tales, a play, Benedix's *Die Lügnerin*, and verses from Goethe, Schiller, Heine and others, with a few translations from Longfellow and Tennyson. The fact that Professor Carruth is a very successful teacher inspires confidence in his class book.

Latin and Greek

Orations and Letters of Cicero. Edited by Professor von Minckwitz. $1.25.
Cornelius Nepos. Edited by J. E. Barss. 90 cents.
Poems of Ovid. Edited by C. W. Bain. $1.10.
Demosthenes On the Crown. Edited by W. W. Gibson. $1.10.
Elements of Greek. By F. K. Ball. $1.00.
New York: The Macmillan Company.
Allen and Greenough's New Latin Grammar. $1.20.
A Latin Grammar. By Hale and Buck. $1.00.
The School Iliad. Edited by T. D. Seymour. $1.40.
Horace's Odes and Epodes. Edited by C. L. Smith. $2.50.
Cicero's Tusculan Disputations and Somnium. Edited by Professor Rockwood. $1.00.
New York: Ginn & Co.
Latin Prose Composition. By H. C. Pearson. $1.00.
Greek Prose Composition. By H. C. Pearson. 90 cents.
Babbitt's Grammar of Attic and Ionic Greek. $1.50.
Earle's Œdipus Tyrannus of Sophocles. $1.25.
New York: The American Book Co.
Selections from Homer's Iliad. Edited by Professor Banner. $1.60.
Greek Lessons for Beginners. By Professors Morrison and Goodell. $1.10.
First Six Books of the Æneid. Edited by Professor Carter. $1.40.
Eight Orations of Cicero. Edited by Professor Forbes. $1.40.
First Latin Book. By Professor Moore. $1.10.
New York: D. Appleton & Co.
Richie's Fabulæ Facilis. 75 cents. New York: Longmans, Green & Co.
Eleven Orations of Cicero. Edited by R. W. Tunstall. $1.50. New York: The University Publishing Company.
Greek Grammar. By Professor Thompson. $1.50. New York: E. P. Dutton & Co.

Professor von Minckwitz's *Orations and Letters of Cicero* is a model of careful and judicious editing. The notes furnish just the amount of help that is needed and no more. The scheme of indicating rhetorical emphasis by the use of italics for words made emphatic by position or antithesis is as admirable as it is novel, and might have been applied advantageously to all the orations. No better plan could be devised for teaching students to read Latin aloud with expression and to appreciate intelligently what they read. The *Cornelius Nepos* of Mr. Barss is a good working edition of the author for the second year in Latin. The student is not only aided in attacking Latin sentences, but warned frequently against the peril of translating wrongly those phrases and idioms which are specially liable to barbarous rendering. Bain's edition of the *Poems of Ovid* will be welcomed by the large number of teachers who consider that some easier poetry than Vergil's should be used in the earlier years of Latin training. The summary of the general laws of quantity and scansion given in the introduction will be found particularly useful. Gibson's *Demosthenes on the Crown* is a scholarly and well annotated edition of the great oration, and, from its critical, historical and grammatical features, admirably adapted for classroom work. In Dr. Ball's *Elements of Greek* the presentation of the principles of Greek grammar is made with great clearness and brevity.

Allen and Greenough's *New Latin Grammar* is a carefully revised edition of a work which has long been regarded as a standard. It has been brought into harmony with the ascertained results of recent studies in comparative and historical syntax. Professors Hale and Buck's *Latin Grammar* combines brevity with fullness and clearness and ought to stimulate the student's interest and infuse new life into Latin studies. The chapters on Phonology and Word Formation are to be commended for their reasonableness and simplicity. While the classification of constructions in the syntax is thoroughly scientific, it is at the same time sufficiently lucid and concise to be easily comprehended by the younger pupil. Altogether an excellent grammar, combining accuracy and completeness with superior scholarship. In the *School Iliad* of Professor Seymour the results of the active researches of the past dozen years in the field of Homeric antiquities are incorporated. It is in every way an admirable book, for its literary as well as its scholarly qualities. *Horace's Odes and Epodes,* by C. L. Smith, and *Cicero's Tusculan Disputations and Somnium,* by Professor Rockwood, are also excellent specimens of the College Series of Latin Authors issued by Ginn & Company. The introductions, commentaries and other

aids by which clear and scholarly criticism of the authors is set before the student leave nothing to be desired.

Latin Prose Composition, by H. C. Pearson, is a plain, systematic and comprehensive treatise, which, if carefully studied, will result in the acquisition of a thorough and practical knowledge of the essential syntactical principles of the Latin language. Like the same author's *Greek Prose Composition,* its directness of statement, conciseness and freedom from unnecessary details make it of great value to both teachers and students. Babbitt's *Grammar of Attic and Ionic Greek* succeeds in keeping abreast with the results of the most recent studies, while avoiding much of the overtechnicality of terminology, which occurs too often in works of the kind. The vowel changes are graphically presented, and the Ionic forms are given in footnotes instead of being combined with Attic forms. This will spare the student a good deal of confusion. Dr. Earle's *Œdipus Tyrannus* is in many respects a noteworthy edition. The play, plot, characters, early phases of the legend and its extant later handlings in dramatic form are exhaustively discussed in the introduction, while the commentary is exactly suited to the needs of the average student, and shows the development of the plot and the connection of thought in each scene and passage. This edition ought to rank as a work of remarkable erudition.

Richie's *Fabulæ Facilis,* is, perhaps, one of the best books that could be employed for the purpose of launching the student into ancient life and introducing him into the reading of connected narrative. The notes, vocabulary and, espepecially, the illustrations are worthy of the highest praise. In his *Eleven Orations of Cicero,* instead of beginning with the Catilinarian orations, as has heretofore been the case almost universally, Professor Tunstall has arranged the speeches of the Roman orator in such a way as to give a connected view of his political and literary life in its chronological sequence. The plan deserves the highest commendation. The introductory chapter on the Roman constitution forms a very vivid presentation of the political changes that occurred during this momentous period.

Professor Thompson's *Greek Grammar* gives a larger place to the results acquired by comparative philology than is usual in elementary works of the kind. The most prominent and useful feature of this grammar, however, is its comprehensive and scholarly exposition of Greek syntax. The author draws parallels constantly between Greek and Latin forms, and, altho a knowledge of Latin will certainly not teach Greek, the contrast regularly and systematically enforced has decided advantages.

The Appleton series of Twentieth Century Textbooks are all admirably edited. Among them Professor Benner's *Selections from Homer's Iliad* deserves special praise for the skill with which the editor manages to convey the fact of the unity of the Iliad as a work of literature and art. There is no reckless process of abbreviation, but entire books or episodes from single books have been selected, the latter being connected, where necessary, by summaries of the omitted portions. The notes, while adapted to the practical needs of the student, contain material which is interesting in itself and sure to stimulate the intelligent student to further reading. The short Homeric grammar accompanying the text exhibits profound scholarship and adds greatly to the practical usefulness of the volume. *Greek Lessons for Beginners,* by Professors Morrison and Goodell, will meet the expectations of teachers who are in favor of thorough drill in grammar from the beginning. Thus, the pupil is guided to a knowledge of Greek through grammar, and with as much speed as is consistent with accuracy and thoroughness. The book is as practical as it is complete and scholarly. Professor Carter's *First Six Books of the Æneid* is a most attractive edition of Virgil. It is a successful attempt to deal with the poem in as literary a manner as possible. The illustrations are remarkably beautiful, and many of them are unusual. The mechanical execution is so excellent that the mere handling of the volume becomes a pleasure. Forbes's *Eight Orations of Cicero* contains, among other useful characteristics, the titles of the principal rhetorical divisions of the speeches, inserted in the proper places in the text. Another prominent feature deserving

notice is the running summaries of the text, which suggest the ideas, but not the words, of the author. The object of Professor Moore's *First Latin Book* is to provide the necessary preparation for the reading of Nepos and Cæsar, by presenting passages of connected Latin and fables and stories from Roman history. The author would seem to have fully succeeded in his ambition. With an intelligent instructor to illustrate the several topics, this little book ought to be of considerable utility.

History

Myer's Ancient History. Revised edition. Boston: Ginn & Co.

Greek History for Young Readers. By Alice Zimmern. New York: Longmans, Green & Co. $1.00.

Elementary American History. By D. H. Montgomery. Boston: Ginn & Co. $1.00.

New Century History of the United States. By Edward Eggleston. New York: American Book Co

Pioneer History Stories. Pioneers on Land and Sea, by C. A. McMurry. Pioneers of the Mississippi Valley. Pioneers of the Rocky Mountains and the West. New York: The Macmillan Co.

Special Method in History. By Chas. A. McMurry. New York: The Macmillan Co. 75 cents.

Makers of American History. By J. A. Chandler and O. P. Chitwood.

The Making of the Empire State. By Jacques Wardlaw Redway.
New York: Silver, Burdett & Co.

American Government. By Roscoe Lewis Ashley. New York: The Macmillan Co. $1.00.

Constitutional History of the United States. By Nelson Case. New York: The Crow Press.

The British Nation. By George M. Wrong. New York: D. Appleton & Co. $1.40.

An indication of the progressive nature of the new methods in teaching is the constant adoption of new ideas. A well-known book that has undergone revision is *Myer's Ancient History.* Among textbooks few have equaled its success with both teacher and scholar. The illustrations and maps, well chosen and beautifully executed, have been increased and a list of references and topics for special study have been added.

The chief difficulty, however, does not lie in the field of the secondary, but in that of the grammar school. Of this class is *Zimmern's Greek History,* for children between the ages of nine and twelve. This history deals too much with events and too little with personalities to command the attention of children at an age when individuals are almost solely interesting. A better book in the same field is *Montgomery's History. Eggleston's United States History* deserves praise for its detailed description of the social life of the Colonial period, its industries, laws, dress and household conditions.

The newer spirit is illustrated by the well-known educator, Mr. McMurry, in his *Pioneer History Series.* These are the outcome of the theories of the author, an exposition of which is to be found in

Colonists Burning a Stamp Seller in Effigy
From "The Making of the Empire State." Copyright, Silver, Burdett & Co.

his *Special Method in History*. In this suggestive book Mr. McMurry points out the advantage of American history over that of other countries, in that it deals with the founding of a nation and can thus command "an appreciative insight into the beginnings of economic, social and political society," with the aid of the stories of our "heroic" epoch.

The two histories for young people, published by Silver, Burdett & Co., are both of local interest. The "Makers of American History" is obviously written for use south of Mason and Dixon's line, and the history of New York especially adapted for the schools of that State.

In the higher branches of social study there are two books on Government; one, a textbook of Civics, the other, a Constitutional History. The former is an excellent and practical work. Mr. Case's book is less a textbook than a treatise. Written in an easy tho too discursive style, it might be profitably used for a hasty reading preparatory to a more exact study in another work.

Among that new series of textbooks which has come into instant favor—The Twentieth Century Textbooks—another one, worthy of the series, has appeared, *The British Nation*. The author sins neither on the side of length nor of brevity. Its liberal tone, its emphasis on social and political changes and its readable style should introduce it to all who cannot use Green's classic work.

Geography

Elementary Geography. By Charles F. King. Boston: Lothrop Publishing Co. 65 cents.
Field and Laboratory Exercises in Physical Geography. By James F. Chamberlain. New York: American Book Co.
Longmans' School Geography. By George G. Chisholm and C. H. Lcete. New York: Longmans, Green & Co. 50 cents.
Special Method in Geography. By Charles A. McMurry. New York: The Macmillan Co. 70 cents.
The Territorial Acquisitions of the United States. By Edward Bicknell. Boston: Small, Maynard & Co.
Carpenter's Geographical Reader. By Frank G. Carpenter. New York: American Book Co. 60 cents.
How We Are Fed. By James Franklin Chamberlain. New York: The Macmillan Co. 40 cents.

Elementary Geography, by Charles F. King, is a decided improvement on previous works of the kind. Instead of abstract and didactic statements, conditions and experiences bearing on home, concrete and journey geography are made the prominent features, Thus, the book has been prepared from the child's standpoint and in accordance with his growth and nature. His interest is enlisted from the very beginning, and this must help the memory wonderfully. The illustrations are numerous and beautiful, especially those taken from the photographs of wild animals and of children and adults of different nationalities.

Mr. Chamberlain's *Field and Laboratory Exercises in Physical Geography* seem well adapted for the purpose. The directions to students are very clear, and the book will meet an increasing demand for practical introductory work in this department.

In *Longmans' Geography* the most vital and salient points receive full treatment in proper perspective, and the admirable method adopted by the authors enables them to give a picture of the world in which all separate facts find place, both as results of special geographical condition and as parts of a logical whole. The style is clear, concise and elegant. A general index of over three thousand words and a special index of commercial products add immensely to the value of the volume, both for the student and the general reader.

A teacher who is eager to interest his class in geography cannot find a better guide than Dr. McMurry's *Special Method in Geography*. It contains many ideas on the subject that are as novel as they are striking and stimulating. The chapters dealing with the correlation of geography and other studies and the outlines of a course study are particularly noteworthy.

Territorial Acquisitions of the United States, by Edward Bicknell. A timely little volume in which the author has succeeded in condensing a vast amount of material without impairing the interest of the subject.

In Carpenter's *Geographical Reader* geography is studied from the picturesque point of view. It deals in a popular and interesting fashion with Australia, our colonies and other islands of the sea, special attention being given to our late acquisitions.

Mr. Chamberlain's *How We Are Fed* begins with the commodities that are familiar to us and uses them as the basis for a description of physical, climatic and human conditions in every part of the world.

Mathematics

Primary School Arithmetic. By J. A. McLellan and A. F. Ames. New York: The Macmillan Co. 30 cents.
Primary Arithmetic. By William J. Milne. New York: American Book Co. 25 cents.
The Elements of Arithmetic in Theory and Practice. By John W. Hopkins and P. H. Underwood. New York: The Macmillan Co. 55 cents.
Mental Arithmetic. By John W. Hopkins and P. H. Underwood. New York: The Macmillan Co. 25 cents.
The Natural Number Primer. By David Gibbs. New York: American Book Co. 25 cents.
Primary Arithmetic. By David Eugene Smith. Boston: Ginn & Co. 30 cents.
Elements of Algebra. By George W. Hull. New York: American Book Co. 50 cents.
Elementary Algebra. By J. H. Tanner. New York: American Book Co. $1.00.
Advanced Course in Algebra. By Webster Wells. Boston: D. C. Heath & Co. $1.50.
Plane and Solid Geometry. By Alan Sanders. New York: American Book Co. $1.25.
Elements of Plane Surveying. By Samuel Marx Barton. Boston: D. C. Heath & Co. $1.50.
Practical Lessons in Astronomy. By Goodwin D. Swezey. New York: D. Appleton & Co. $1.00.
Elements of the Theory of Integers. By Joseph Bowden. New York: The Macmillan Co. $1.25.

There is ample supply of arithmetics for this generation of American children and it grows year by year. The list above names a few drops of the increase. There is a reason for each, tho in some cases it is a "wee frail body."

The *Primary Arithmetic* of McLellan and Ames, while dominated largely by a fad, contains valuable suggestions for teachers and is arranged and developed to interest pupils. The "dot" business seems rather overdone, and there are inaccuracies, as in limiting the term "ratio" to one of its applications and using the word "prism" for quadrangular prism.

The other arithmetics of the list are prepared evidently with care. They have merit and can be made good guides for pupils. Preferences will vary; in the end it will be the teacher, not the text.

Professor Hull's *Elements of Algebra* is worthy of all praise for its admirable restraint. It gives elements; it refrains from variations, which so confuse most elementary texts. Now and then a slip appears. "Composite" should not be limited as in Article xxxvi; a factor is a component, a component is not necessarily a factor. The note (page 100) concerning the use of the "first method" for solving quadratics is not justifiable. At least one professor of mathematics would rely almost entirely on the first method. The text is, on the whole, most satisfactory.

Professor Tanner's book is a disappointment. He is known as a good mathematician and is one of the authors of a good text on Analytical Geometry. The *Elementary Algebra*, however merits scant praise. Much ado is made in supposed explanation of very simple things; there is constantly a "darkening of counsel by words." Either in an effort to make easy the transition from arithmetic to algebra, or following a recent German fad, the word "quantity" throughout the book is replaced by the word "number." The effort to jam the concepts with which algebra deals into the word "number" is sometimes painful. Number and quantity are not interchangeable terms. Algebra deals with quantities, sometimes numerical, sometimes not. Even were the terms interchangeable nothing is gained by throwing aside the long established expressions and framing new forms for well recognized relations.

Professor Wells hardly advances in his *Advanced Course in Algebra;* it is only more poured into the hopper. Definitions lack precision; there is no proper ordination. Professor Sanders has made a text with a clear notion of geometric truths and a positive knowledge of how to teach them. Professor Barton's *Surveying* deserves the highest praise. It is accurate, precise, clear; shows a full appreciation of troublesome points and treats them successfully. Professor Swazey does excellent service in his little book on astronomical practice. It is well devised and executed and will make easy more genuine work in this most fascinating science. The generalizations of number relations are put in very distinct form by Dr. Bowden. Processes and relations universally accepted are rigorously established and lead naturally to results far beyond the ordinary field.

Physics and Chemistry

Physical Laboratory Manual. By H. N. Chute. Boston: D. C. Heath & Co. 80 cents.
Physical Laboratory Manual. By S. E. Coleman. New York: American Book Co. 60 cents.
Mechanics, Molecular Physics and Heat. A Twelve Weeks' College Course. By Robert Andrew Millikan. Boston: Ginn & Co. $1.50.
Laboratory Physics. By Dayton Clarence Miller. Boston: Ginn & Co. $2.00.
Lessons in Physics. By Lothrop D. Higgins. Boston: Ginn & Co. 90 cents.
Descriptive Chemistry. By Lyman C. Newell. Boston: D. C. Heath & Co.
Elements of Inorganic Chemistry. By Harry C. Jones. New York: The Macmillan Co. $1.25.

Chute's Laboratory Manual has been known for many years as one of the best

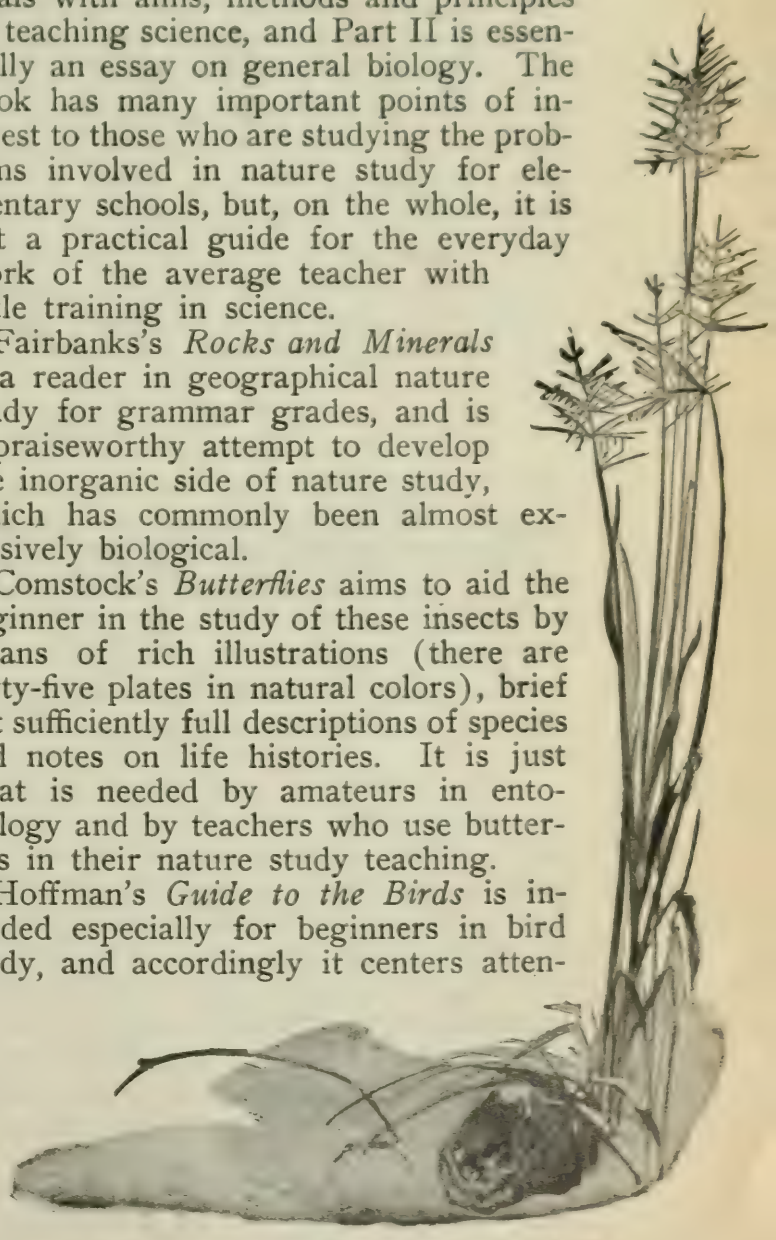
for secondary schools and now appears in a revised edition. The experiments are nearly all quantitative and practicable. It has the very great merit that the teacher will be called upon for help by only the careless and unintelligent in the class, for the directions state clearly what to do, what to use and how to use it. *Coleman's Manual* is very similar to this in scope and character and a choice between them will depend on the laboratory conditions.

Millikan's Mechanics, Molecular Physics and Heat is a college textbook of the highest class in which mathematical theory, definitions, experiments and problems are given together. Antiquated apparatus is not even described, and many new and ingeniously constructed instruments are used by which a greater degree of accuracy can be attained by the student than has previously been thought possible. *Miller's Laboratory Physics* is not so thorough and original as the preceding, but covers the whole subject of physics in one volume devoted exclusively to laboratory directions for college students.

Higgins's Lessons is so old-fashioned in style that we wonder it is not called Natural Philosophy; certainly a book containing no experiments and no problems for the students cannot be said to deal with the same subject as those before mentioned, which are almost exclusively mathematical and experimental. It is written in a primer style and not very accurately. It contains a postscript on chemistry.

Newell's Descriptive Chemistry is a conventional, comprehensive textbook of 550 pages, giving a large amount of information clearly stated and including the usual laboratory course and problems. Personally we should prefer to have most of the historical matter and all of the portraits cut out, and the new dynamic and electrical theories made fundamental instead of appendical, but that is a matter of personal judgment, in which all would not agree. Professor Jones, in his *Elements of Inorganic Chemistry,* professes good intentions in regard to the use of the theories of physical chemistry, but an examination of the book does not indicate that he considers them of much value in elementary instruction. We dislike, too, leaving out all organic compounds in a textbook which gives the ordinary student all he is to know of chemistry. A little knowledge of carbon compounds is of more practical value than the little knowledge of technological processes, not always up to date, which crowds it out.

Nature Study



Education Through Nature Study. By John P. Munson. New York: Kellogg & Co. $1.25.
Stories of Rocks and Minerals. By Harold W. Fairbanks. Boston: Educational Publishing Co. 60 cents.
How to Know the Butterflies. By John Henry Comstock and Anna Botsford Comstock. New York: Appleton & Co. $2.25.
A Guide to the Birds of New England and Eastern New York. By Ralph Hoffman. Boston: Houghton, Mifflin & Co. $1.50.
A Watcher in the Woods. By Dallas Lore Sharp. New York: The Century Co. 84 cents.
The Tree-Dwellers. By Katherine E. Dopp. Chicago: Rand, McNally & Co.

Part I of Munson's *Nature Study* deals with aims, methods and principles of teaching science, and Part II is essentially an essay on general biology. The book has many important points of interest to those who are studying the problems involved in nature study for elementary schools, but, on the whole, it is not a practical guide for the everyday work of the average teacher with little training in science.

Fairbanks's *Rocks and Minerals* is a reader in geographical nature study for grammar grades, and is a praiseworthy attempt to develop the inorganic side of nature study, which has commonly been almost exclusively biological.

Comstock's *Butterflies* aims to aid the beginner in the study of these insects by means of rich illustrations (there are forty-five plates in natural colors), brief but sufficiently full descriptions of species and notes on life histories. It is just what is needed by amateurs in entomology and by teachers who use butterflies in their nature study teaching.

Hoffman's *Guide to the Birds* is intended especially for beginners in bird study, and accordingly it centers atten-

From "A Watcher in the Woods." Copyright, The Century Company

tion on the prominent colors, the characteristic habits and haunts, and other points which will help the beginner identify birds as seen out of doors. There are keys arranged on a color scheme for winter, March, April, May, summer and autumn.

Sharp's *Watcher in the Woods* presents for reading in schools the very best of the chapters in the author's "Wild Life Near Home." It is attractive literature at the same time that it is interesting and accurate natural history, and it makes a strong appeal for sympathetic interest with common animals.

The *Tree-Dwellers*, by Dopp, is the first of a projected series of school readers to be known as the "Industrial and Social History Series." These are designed to direct the "primitive life studies," which, in recent years, have been experimentally introduced into the primary grades of certain schools, notably those under the influence of Professor Dewey at the University of Chicago. The present book tells children how primitive people lived, weaving in the facts known to science, and the simplest activities of primitive man are made to suggest practical work for the pupils in the line of manual training.

Biology and Physiology

Bacteria, Yeasts and Molds. By H. W. Conn. Boston: Ginn & Co. $1.00.
Synoptic Text-Book of Zoology. By Arthur W. Weysse. New York: The Macmillan Co. $4.00
Our Bodies and How We Live. By Alfred F. Blaisdell. New York: Ginn & Co. 75 cents.
The Elements of Physiology. By Walter Moore Coleman. 90 cents.
The Child's Physiology. By Walter Moore Coleman. 40 cents.
Practical Lessons in Human Physiology. By John I. Jegi. $1.00.
New York: The Macmillan Co.

The elementary knowledge concerning micro-organisms needed by all persons who have practical charge of homes is presented by Professor Conn in a popular and very readable style, and at the same time the book is thoroughly scientific and practical. An excellent appendix suggests many experiments for the practical teaching in schools where this book may with profit be studied in connection with the lessons in domestic science.

There are many textbooks of zoology for college students, but Professor Weysse's new volume has a distinct place because its subject matter is well selected and arranged with reference to the needs of the average student, who wants a general survey of the science. At the same time it is a good introduction for those looking forward to special work in zoology or other phases of biology.

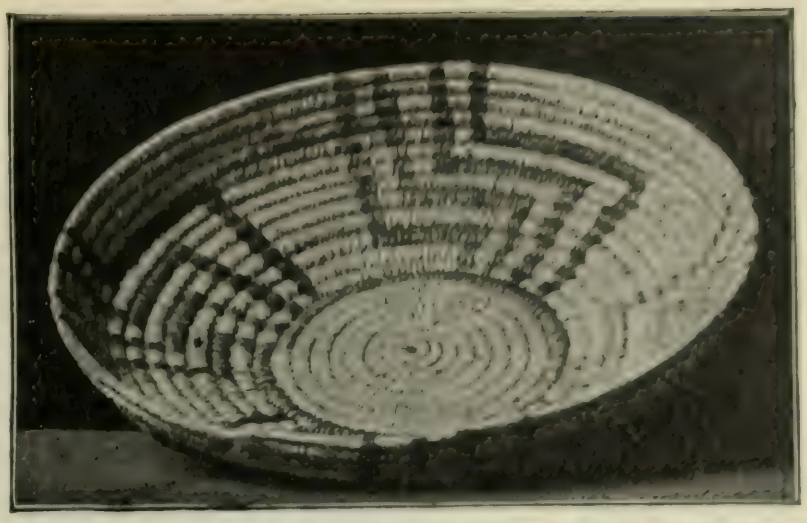
Blaisdell's *Our Bodies* is a revised edition of the well-known textbook for elementary schools, which the author first published twenty years ago. Its points of excellence are: Emphasis upon personal health, suggestions for practical teaching, a chapter on accidents and emergencies and one on bacteria.

The *Physiologies* by Coleman present subject matter on structure, function and hygiene of the human body similar to that found in many other textbooks designed for public schools. In many paragraphs there are interesting innovations; but, on the whole, the books are not convincingly an improvement over a number of earlier books which cover the same field. As to the method of teaching, the books are too exclusively textbooks, and fail to give a strong emphasis to the practical method, which in these days is regarded all-essential in science study. The above remarks on Coleman's physiologies apply to the book of Jegi, which appeals to the reviewer as simply another teacher's variation in presenting the same subject.

Unclassified

Spanish-English and English-Spanish Dictionary. By Arturo Cuyas. New York: D. Appleton & Co. $2.00.

In their *New Spanish-English and English-Spanish Dictionary* the Appletons have supplied the long felt need of a complete and accurate vocabulary of the Spanish language. It has many features that are unique, useful, and that entirely differentiate it from other lexicons of the same kind; among them its inclusion of a large number of words, phrases and idioms only to be heard in Spanish America and the Philippines.



Moratin's El Sí de las Niñas. By J. Geddes and F. M. Josselyn. New York: American Book Co. 50 cents.

The best known and brightest of Moratin's comedies—*El Sí de las Niñas*—is admirably adapted for beginners, who are moderately well equipped gramatically, for it swarms with idioms used by

every class of Spanish society from the highest to the lowest.

An Italian Grammar. By Mary Vance Young. New York: Henry Holt & Co. $1.25.

An Italian Grammar, with Exercises, by Mary Vance Young, may be commended to students of Italian who wish to make rapid progress. Only the essential features are noted, and everything that does not conduce to practical utility has been omitted. The chapter devoted to phonetics is excellent, and shows that Miss Young can be at once utilitarian and philosophical.

Navaho Weave. From Tinsley's "Basketry." E. L. Kellogg & Co.

Tools and Machines. By Charles Barnard. New York: Silver, Burdett & Co. 60 cents.

Mr. Barnard writes with great enthusiasm and knowledge about the evolution and construction of our common tools, such as the hammer, the saw and the knife, from the prehistoric stone implements to modern power machinery. Such a book in the hands of a boy will do much to inspire him with respect for the tools he is using. It should be in the handy book-shelf of every manual training school.

Practical and Artistic Basketry. By Mrs. Laura Rollin Tinsley. New York: E. L. Kellogg & Co. $1.00.

This is designed especially as a teachers' guide to the instruction of pupils in the public school, and includes practical directions for work in raffia, rattan, willow twigs and a great variety of other materials. It is well illustrated by photographs of the finished articles and drawings of tools and stitches.

Reminiscences of My Literary and Outdoor Life

BY W. H. H.—"ADIRONDACK" MURRAY

[This week we conclude Mr. Murray's Reminiscences, which we began in our last issue. This is the last article he ever wrote.—EDITOR.]

THE popular excitement which followed the publication of the little volume was of a nature difficult to describe. It leapt instantly to the forefront of public attention. Not only Boston, but the nation, was talking about it. The geographical ignorance that the discussion revealed was simply astounding. Men of standing, clergymen, editors, declared through the columns of their papers and from the pulpits where they preached that there was no such wilderness in the State of New York; that the book was a hoax, a cruel hoax, an outrageous creation of deceit. Letters came pouring in upon me by scores and scores from ministers and laymen alike, upbraiding me and stating that I ought to be turned out of the ministry for leading people astray, especially young people and invalids. And several clerical brethren introduced resolutions of censure in their convocations. Even *Harper's Illustrated,* a prudent publication, carefully and decently edited, came out with a broadside cartoon of myself and my disciples and described those who were credulous to believe in me and the woods as "Murray's Fools."

During the years I was in public life

I was compelled more than once to stand up against a good deal of pressure and listen to most outrageous and insulting vilification without opening my mouth, but never did I have to brace myself against a stronger sweep and suction of ministerial and newspaper abuse than the summer following the publication of "Adventures in the Wilderness." It was a deliberate effort to howl me down and smash me to pieces, and so far it succeeded that the little book, which had been selling at the rate of five hundred a week without forcing, suddenly dropped to five volumes a week and was dead, apparently, beyond the hope of resurrection. The American people can take a joke as well, if not better, than any other people in the world, but they won't stand being hoaxed, and for weeks the country rang with the cruel falsehood which had been foisted upon them. But the little book was not dead, and when it came out of its grave it was "as a bridegroom coming out of his chamber, and as a strong man rejoicing to run a race." But I stood to my guns and said nothing. It was my silence that puzzled and intimidated those who were trying to yell me down, for they knew that I stood to lose all that made life worth living, and they could not understand how I could see the hopes of life, the joys of usefulness and the pride of a career swept away from me and make no sign. But why should I worry when I knew that the woods of God were there, that within forty miles of the capital at Albany was the southern edge of a wilderness geographically as large as the State of Connecticut; that there were more than a thousand lakes in this wilderness; that there were hundreds of high mountain peaks; that this great wilderness was so interlaced with rivers and water courses that you could boat a hundred miles through the fragrant woods and not walk five, and that the air was so pure, cool and charged with restorative elements that the nervously exhausted breathing it felt vigor return to them, and those who were dying from pulmonary difficulties were literally called back from the edge of the grave?

I have often been asked to which I attributed the greater influence in advertising these woods and sending people into them, the Adirondack volume or the Adirondack lecture. There has never been the least doubt in my mind. It was the lecture on the Adirondacks that won the fight. It was delivered over five hundred times in New England alone. Nearly half a million of intelligent men and women listened to it. It literally captured the lyceum platform, and when I decided to withdraw it it became almost impossible to do so. At the close of its delivery I was compelled often to remain on the platform an hour, giving practical information and advice to those who intended to go to the woods the next year. It was perhaps the most influential utterance I ever made, judged by its influence on the people and the fashion of outdoor recreation which it promoted.

General Grant, in the preface to his Personal Memoirs, says, "Man proposes, God disposes. There are but few important events in the affairs of men brought about by their own choice." My experience corroborates to a degree this statement of General Grant. I have never in any sense ordered my life. As a boy I planned to be a lawyer, and yet under compulsion of spirit I became a clergyman. My hope and prayer was to go West, where were the beginnings of empire, and yet I was constrained to serve in Boston. A Yale graduate under the eyes of Harvard, a speaker whose pronunciation was after Webster in a city where Worcester was accepted as law, a young man that never dreamed that he should write a book and who has devoted thirty years of his life to authorship, a public speaker with no aspiration to the lyceum platform and yet who has spoken over two thousand times to popular audiences,—with such a record, why should I not coincide with General Grant's statement that "Few important events in the affairs of men are brought about by their own choice"? Wendell Phillips once said, in presenting me to a great audience in Music Hall, "Ladies and gentlemen, I have come here to-night that I might present to you the quietest orator that ever spoke in Boston, and who, buried away out of sight in a little mechanical village in Connecticut, without thought of ever being an author, wrote that marvelous little volume which has kindled a thousand camp fires and taught a thousand pens how to write of nature." And this is the way I came to be a lyceum speaker:

When I went to Boston the church that called me to its pastorate was deplorably placed. Dr. A. L. Stone, a man of eloquence and great social charm, had been called to San Francisco, and the church had been without a pastor for some three years. Its congregation had scattered. It had a large membership, but the first Sabbath I preached in it the audience was not much, if any, over three hundred. As the church seated about fourteen hundred, you can imagine its emptiness. But within three months the pews were practically all rented, the average wealth and intelligence of the audience was high, and four hundred camp stools had been introduced to seat the overflow from the pews. Such a state and condition of things attracted great attention and had to be accounted for. The world did what it always does in such a case, by denying that the preacher had ability, by honest and simple speaking, to attract such a throng and had done it by resorting to gross sensationalism. The professors of eloquence called the attention of their pupils to the nasal twang of my tones and warned them against the vocal horror from Connecticut. The disciples of Worcester, through the Boston *Advertiser*, laughed at my pronunciation. They advertised me as the ministerial jockey. An ex-Governor's wife amused her coterie by describing my personal peculiarities—that I was accustomed to come into the church on Sundays with one trouser leg outside my boot and the other inside; that I literally galloped up the pulpit stairs, bounced into the chair, grabbed the wig from my head, which I wore to conceal or make good the absence of nature's covering, and honed my glistening pate with a great big red bandana handkerchief, and that one Sunday I illustrated a passage of Divine truth by sliding down the great banisters of the pulpit—and because of such uncouth and outrageous doings I so suddenly filled the church.

These stories going abroad led to great confusion of mind touching the new pastor of the old, historic church, especially among the three thousand and odd Congregational clergymen who looked to the Park Street pulpit, and had a right so to look, as bound to set the example of decorum and dignity; and at last the officers of the church came to my study one evening with the strange stories that were going around about their young pastor and the lies that were being told about him, and I was made aware of the extent of the misrepresentation.

Now it chanced, as most of you know, that as a speaker my style of expression and action was exceedingly simple and my voice was never explosive or my gesticulation over-earnest. In all my career as a public speaker I never told a story or an anecdote even at a Sunday school. For ten years every morning discourse of mine was put into type, and not a passage can be found in them all calculated to create a laugh. This, my officers knowing, had wrought upon them powerfully, and they exclaimed, "Mr. Murray, these falsehoods about you have got to stop." I replied, "I don't see how you are going to stop them. Better men than I have been lied about since the beginning, and better men than I will be lied about to the end." After a moment of silence, Deacon Farnsworth—called the William E. Dodge of Boston—said: "Mr. Murray, can you write a lecture?" I replied, "I do not know what I could do, but why should I write a lecture?" His answer was this: "The people are not fools and they love fair play. If they could only hear and see you on the platform, the evil would be stopped." After a few moments' reflection I said, "Perhaps it might do some good, and I will think the matter over. If I write a lecture to kill off these charges of sensationalism I had better take a subject that is sensational, something that gives me every opportunity to be a sensationalist and an oratorical mountebank, and that subject is certainly the Adirondack life and experience in the woods." And that is the way I became a lyceum lecturer and the prime cause of the Adirondack lecture being written.

That year I delivered it one hundred and ninety-eight times. The next year two hundred and two times. Of course, as I got into the matter, I saw the great service that such a speech might do, and I carried it, as Longfellow's youth carried the banner with the strange device, up and down the villages and cities of New England; advocating rest and recreation, the evangel of outdoor life, and persuading the people to the sweet, the healthy, the holy impressions of nature How unconventional it all was, this

movement of the popular mind toward truth and life, and how it added to the laughter and good nature of the world! How different it all was—that early experience—than what is possible to-day. Now we ride in Pullman cars to hotels that are palaces of fashion and extravagance, to camps—what a misnomer!—the building of which cost from ten to a hundred thousand dollars; whereas, in those early and blessed days, we were bumped in buckboards over corduroy roads, or tramped fifty miles to get to our little boats where the guides were waiting.

It was in this great campaign, the object of which was to persuade the people to look to outdoor life and its sports in a different way than they had ever done, to deliver them from the tyranny of the conventional and win them over to the liberty of the natural, that for the first time in my life I realized the dignity and value of the lyceum platform and the noble uses which it served. In what other connection could great questions be argued, information given, conscience quickened and moral enthusiasm supplied to the masses? What courage, what scholarship, what talents, what grace and liveliness of person and what enthusiasm for the right, for the larger thought, for the nobler life, did the speakers of the old-time platform represent! Sumner, the orator and statesman, an aristocrat of immaculate ancestry, who almost forgot the blueness of his blood when pleading for the slave; Whipple, the only faultless critic of literature that Boston has ever produced; Gough, the inimitable, who told me that he never begun to make a speech that his knees did not tremble like a schoolboy's, nor end one, as I suggested, until the frame of the building trembled and shook with the thunder of applause; and Phillips, the faultless orator, to match whom in eloquence no race or nation puts forth a candidate save the Greeks in the person of Pericles; and Beecher, the marvelous, seer and prophet of God, the highest expression of oratorical genius that the Church has produced since Chrysostom was born; Parsons, the Irish orator, who brought to us the training of Dublin University, and who told his audiences of the glories of Michael Angelo's art so vividly that they could feel that they were gazing at his immortal frescoes; and Willets, of Philadelphia, the octogenarian, who patiently sits in his starlighted night as one who waits for a sunrise in the light of which he will again behold the faces of his great *confrères;* and Miss Dickinson, whose voice was as the voice of Melise, who at the demand of Roderic Dhu bore with swiftest foot the fiery cross summoning the clans to battle; and Lillian Egerton, whose only fault was that she could not realize her own genius, the handsomest woman that I have ever seen in any country on stage or platform—these are the ones who made the lyceum platform great and honorable, who carried light and leading in their hands to the people. I was the youngest member of the great group. For seven years I spoke outside my pulpit over a thousand times on that same platform with them. There was no rivalry among us. There was no envy. There was room for us all; fame for us all, work for all of us, and the people welcomed us with almost equal regard. Alas, alas! If I call will they come? If I look shall I see the beauty and glory of their faces? If I listen shall the charm of their speech make music in my ears as of yore? Nay, envious time has reversed the cup, and the wine of life has been emptied on the ground.

"When I remember all the friends so linked together
I've seen around me fall like leaves in wintry weather,
I fell like one who treads alone some banquet hall deserted,
The flowers all dead,
The lights all fled,
And all save me departed."

Editorials

The Russian Troubles

It was Russia against Japan; it is now Russia against the world. Russia's experiments in international law, in the matter of the seizure and sinking of neutral ships, find approval nowhere, not even with her ally France or her humble suitor Germany. The assassination of her cruel Minister of the Interior awakens surprise in no country, and the condemnation of violence which we all utter is tempered by the declaration that it was the natural result of the barbarous system which provoked it. Russia complains that the United States and Great Britain give their marked sympathy to heathen Japan and not to Christian Russia; let Russia's Government cease to be represented by De Plehves, and let the will of the people rule and the welfare of the people be the object of the Government, and the sympathy of the world and the glad sympathy of the United States will crown Russia with blessing. Our warm regard goes to Japan because she is the latest country to exchange despotism for freedom; let Russia do what the rest of Europe has done, what Japan has done, establish a constitutional government, and she will see how quickly and how gladly we will give her our sympathy. Then Russia would cease to be a horror and a terror.

Public interest has been diverted from the fighting in Manchuria by the capture of neutral ships and the murder of De Plehve. That Russia was guilty of a breach of international law which the civilized world cannot permit is clear. She was allowed to take two vessels through the Bosphorus on the pretense that they were merchant vessels, such as they had been. But just as soon as they had passed the Suez Canal, without having touched at any Russian port, by a mere change of flag, they made themselves vessels of war. They are one or the other as they choose. What is to hinder them to-morrow, if a Japanese war ship was to heave in sight, from again hoisting a mercantile flag? That would be just as reasonable. The fact is that in stopping and capturing British and German vessels they were acting as pirates under international law. Therefore Russia has been compelled, by the voice of the world, even of France and Germany, to return the vessels and make apology.

Equally wrong has been the action of the Vladivostok squadron in sinking captured vessels. If neutral vessels carry mainly contraband of war, what is really contraband, arms and food for the army, not railroad stores and flour for home consumption, Russia has the right to seize them, take them to any of her ports, bring them before a prize court and condemn and hold vessels and cargo. But she has no right, on the judgment of the captain of one of her war vessels, with no trial, to seize and sink a British ship. The act of the Vladivostok fleet has been nothing less than barbarous. Again the world condemns it, and Great Britain calls Russia sharply to account for it. It is reported that the Russian Department of Marine overrules the wiser and weaker Department of Foreign Affairs, and refuses to yield, and may even reverse the decision of Count Lamsdorff and the Czar. That will be madness, just such madness as has ruled Russia, for we do not give her the usual credit for extreme subtlety of diplomacy. The suggestion made in so many quarters that Russia is purposely embroiling herself with Europe so that she may, in the event of being compelled to negotiate peace, seem to yield to the concert of European Powers, and not to feeble and contemptible Japan, is not at all plausible, even altho we hear it made even in Japan. Russia has no idea yet of submission to her alert foe. She means and expects to drive Japan back to the sea, if it takes ten years, and to dictate a peace in Tokyo. So blind are

the Grand Dukes and bureaucrats that dominate a well-meaning but weak Czar.

And now, following this embroilment, comes the assassination of De Plehve. That turns public interest to the internal condition of Russia and her future. There is no question as to the cause of his murder, nor any doubt that the persecutor of Poles, Jews and Finns had provoked his fate. The only question is as to the effect of it on Russia. Will it mean greater repression and cruelty, or will its effect be to frighten the rulers of Russia into some more regard for the welfare of the people? The first effect, of course, is multiplied arrests of suspects and more savagery to answer the savagery of assassination. The world wants to see whether De Witte, who has the reputation of being a somewhat more liberal man, will be made the Czar's principal adviser, or whether the Alexieffs and Ignatieffs will maintain their control. It is ominous that the aged Ignatieff, bitter persecutor of Jews and Nihilists, has been recalled from retirement to be successor to De Plehve, but he is not likely to be long in that position. De Witte has been called from Berlin to consult, and is said to have been offered the seat next the throne, which he refuses to accept unless he can have a free hand. It is to be expected that the immediate effect of this political murder will be bad, but, preceded as it has been, and followed as it is likely to be, by other political assassinations, it is rather probable that it will turn the thought of the Czar to the reforms that are needed and demanded. Nicholas II is weak and erratic; but he may be affected as was his grandfather, a strong man, who began his reign with great severity, but who, when the Nihilists struck blow after blow, called Melikoff to the helm, the most progressive man Russia has had in power, and who was ready to grant a constitution when he was unfortunately assassinated. There are many signs of revolution in Russia, and the Japanese successes help the movement. Japan's progress dates from the day when she adopted a constitutional government; Russia needs parliamentary government for her internal peace and growth. She needs no external aggrandizement, and this war is likely to strip her of her latest acquisitions.

The Strikes

A REALLY wise labor leader must have seen in the condition of business for several months past a formidable argument against any strike not demanded by hard injustice and an intolerable situation. There has been no general reduction of wages, but an enforced restriction of production has compelled the discharge of many thousands of workmen. Railway companies have ceased to make costly improvements; some of them have cut off a considerable number of their trains. In this industry alone not less than 75,000 men have lost their places. Many thousands more are idle at the steel mills, the locomotive factories and the car shops. In some other industries the hours of labor have been reduced by more than one-third. With such an increase in the number of the unemployed, strikers are at a great disadvantage, and labor leaders should seize every opportunity to obtain by arbitration a remedy for grievances. The difficulties of the situation were clearly seen by Mr. Henry White, an exceptionally well informed labor leader, who sought in vain to prevent the strike of 40,000 garment workers in New York against an "open shop." That strike appears already to have failed. Its purpose was to preserve for the employees certain advantages which they believed they were in danger of losing. But the time was not propitious. They should have been governed by his advice.

It would have been better for the cotton mill workers at Fall River to seek a modification of the companies' terms, or even to accept them, than to quit work. The employers' attitude left something to be desired, it is true, but a reduction of wages—like the preceding restriction of output—appears to have been demanded by the condition of the industry. Owing to the high price of cotton, declining sales of goods, and the competition of cheap labor and a long work-day in the Southern mills, the companies could make no profit. They are not in a Trust, and their dividends have been quite moderate.

Employers will not continue to do business at a loss if they can avoid it. If there could have been a free conference between the Fall River employees and the companies' officers a reasonable understanding and a compromise might have been reached. This would have been better than idleness until October.

At the great packing houses of the Beef Trust the skilled workmen went on strike in defense of the unskilled, who are a majority, and also for their own protection. The wages of many of the unskilled had been reduced below the rate of 18½ cents an hour, a rate supported by an agreement which had expired. In last week's INDEPENDENT Mr. Poole showed that this rate averaged only $7.40 per week. Unions of skilled men believed that this foreshadowed an assault upon the workmen's organizations and upon the wages of skilled labor. Bearing in mind the increase of the price of beef during the last two years, they could see no valid reason for a reduction of wages. They went on strike because the old rate for unskilled men was not restored and fixed by another agreement.

They were too hasty. It is admitted that the packers offered arbitration. The unions' excuse for rejecting or ignoring the offer was that it was not received until some hours after the strike order had been issued. That was not a good excuse. The offer was received before the beginning of the strike. It should have been accepted. Labor leaders familiar with the condition of business throughout the country would not have hesitated to accept it. Altho there is evidence of unjust discrimination and harsh treatment on the part of the packers when the men returned to work on the 22d ult. under the agreement made two days earlier, we think the unions were hasty and u wise again in so quickly and angrily renewing the strike on that date. This agreement provided for the arbitration of every question and all grievances. By exercising a little patience and common sense, remedies for the injustice of arrogant subordinate officers could have been obtained. That portion of the agreement which related to the re-employment of strikers and to the arbitration of instances of discrimination warranted the packers' interpretation of it. The unions had helped to make it and had signed it. They could not reasonably complain of their own work.

It was possible on that day to settle the controversy upon terms which, after arbitration, would probably have given the strikers a victory, altho some would have been excluded, because the packers were permitted by the signed agreement to retain all the non-union men who desired to stay. Not many would have remained, and these might have been induced to join the union. Thus the organizations might have been defended against attack. But the union leaders preferred, and with scarcely any delay, to renew the strike. They even declined to permit another attempt to enforce the agreement. And so the contest was renewed, and has been continued, with the usual accompaniments of violence, brutal intimidation and manslaughter. At the time when we are writing, there are indications that the battle will be lost by the strikers. Nearly half of their places have been taken by new men, more than a thousand strikers have deserted their associates, and others are asking the packers for terms. Defeat will sap the strength of the unions, be disastrous to many of their members, and place the unskilled workmen completely at the mercy of the packers. And if defeat comes, it will be due to a lack of brains and good judgment.

The effectiveness of unions as a means of benefiting and uplifting workingmen depends largely upon the wisdom of their leaders. In this beef workers' controversy the men have had the moral aid of much public sympathy, owing to the attitude of the people toward a greedy combination, altho the strike itself has increased the cost of food. It is a combination which the Government has prosecuted and placed under bonds to obey the law; and the prevailing belief is that it has continued its unlawful practices. But even in a struggle between such a combination and its employees, the public cannot overlook the folly and the blunders of the men or excuse the crimes of violence which they have committed.

Unlawful combinations should be prosecuted and punished. A failure so to proceed against them does not authorize their employees when on strike to commit brutal assault, manslaughter and murder in their attempts to prevent the

use of other men in their places. Our present laws and institutions give an employer the right to employ other men in the places of workmen who voluntarily leave his service; they give these other men the right to work for him in peace and safety. Until we decide to lay aside these laws and institutions, these rights must be protected.

Shall the President Intervene?

JUST the time when a Presidential election is at hand is chosen for a great strike, and the proposal that President Roosevelt intervene causes the Democrats to look on with satisfaction, thinking that it cannot but damage his chances for election. If he refuses to intervene, as is likely, they imagine that thousands of strikers will vote against him. We do not take Mr. Roosevelt to be the kind of man who will allow the effect on his election to govern his action in the case, nor do we expect that he will consent to meddle with the matter.

They think that because he intervened in the case of the coal strike he will do the same in the case of this meat strike. But the two cases are entirely different. Mr. Roosevelt did not intervene then out of any regard for the strikers or the coal operators. If they only had been concerned he would have let them carry on their conflict until both sides were exhausted. It was the people he was considering, the people that could get no coal and were in danger of freezing to death.

Remember that it was in the beginning of winter. Coal had doubled in price. In many places people could get no fuel. They could burn nothing but anthracite coal. There was danger of a general coal famine, and it had already begun in the coldest part of the year. It affected all of the people in the Eastern States, millions of men and women that were not at all responsible for the difficulty between the operators and the miners. In some places so desperate were poor people through lack of coal for their freezing families that they stopped and robbed the coal cars that were passing on the railroads. It was a great public calamity and danger that was upon us, and Mr. Roosevelt, not as President—for he had no authority—but as the most prominent and exalted private citizen in the land, invited the two parties to meet him, and by the pressure of his influence he persuaded them to come to terms. He did what Cardinal Gibbons or Bishop Potter might have done. It was an act of great public policy, and it deserved all praise, and the success justified the act.

There is no such condition of things now. Nobody is freezing, nobody is starving. The great public are not suffering. The price of meat has risen but a trifle, where it has risen at all. The only persons that suffer by the strike are those that refuse to agree on the conditions of work. Let them fight it out, and let the President give them his good wishes and let them alone.

There is no such monopoly of meat as there was of coal. Independent butchers can buy beeves, sheep and hogs as much as they will, or the strikers can get up abattoirs of their own. Beef cattle can be bought reasonably of plenty of men who are glad to sell for a reasonable price. Besides, we do not depend on beef as we do on coal. Every one had a stove made to burn anthracite coal and nothing else, and nothing else was to be had to burn. But if we could not get beef—and we can get it—we could get poultry and eggs and milk; and people do not have to eat meat in order to keep in good health. Vegetarians are as strong as meat eaters, and most people in this country eat more meat than is good for them.

The conditions are thus utterly different from what they were in the time of the coal strike. Then we were all anxious, where we were not suffering. Now most of us would not know, but for the newspapers, that there was any trouble about the meat supply. The public does not need, and does not ask, and does not expect President Roosevelt to interfere in a difference of this sort, which does not discommode the great public, but affects only those people who are not ready to come to a settlement of their differences.

The Survival of the Public

MANY things indicate that the great process of natural selection, that has determined the destinies of species, of peoples and of institutions through unnumbered centuries, is to-day working upon

new material and yielding some curious new results.

Since written history began to preserve for us a record of the experiences of civilized men, there has always been an antagonism between public and class interests. Strictly speaking, public interests are those that touch the welfare of every individual in a politically organized State. "The public," in this large sense of the word, is the entire community or commonwealth.

A vast majority of the interests of mankind are individual or class interests. More than nine-tenths of the thought and work of the average man is devoted to his personal affairs, the welfare of his family and the conservation of those things that pertain to his occupation or profession; or to the existence or the power of the social class to which he belongs. Very little of his life is given to the state or the nation directly. Conditions are conceivable under which men might live such thoroughly individualistic lives that government would cease to have any functions, and the politically organized state would no longer exist. All the forces of natural selection would work toward its elimination.

Such conditions never have prevailed, however, over any wide area, or for any long time. The supreme common interest is the common safety, and whenever this has been threatened by invasion or menacing enemies a "public" has at once been created. Men have discovered that, in addition to their private and class interests, they have a wider interest in which all share equally. As a fact of history, war has thus far been the condition under which public interests and a public opinion have come to birth and waxed strong.

Only secondary to danger from foreign foes has been danger to life and property arising from internal disorder and the criminal instincts of predatory individuals. A public interest has, therefore, arisen in laws and their administration. Men have been willing to make some sacrifice of time and wealth to maintain the institutions of courts and a policing government.

As wars become less frequent, and individuals more law-abiding, the public interest dwindles and "the public" becomes less and less a great reality, unless new objects of common concern are created by the new conditions that are ushered in with the later stages of social evolution. There are social philosophers—in particular the philosophical anarchists—who look forward with hope to the natural disappearance of the state. Whether they have any valid grounds for their expectations is an interesting question. Such a conclusion would imply that the public is to have no interest in such matters as education, sanitation and municipal conveniences.

A fruitful cause of internal discord in the states that have thus far existed in the civilized world has been the evolution of class interests and consequent class antagonisms. The struggles of the high-born and the base, of the ecclesiastical conformists and the dissenters, of the rich and the poor, have precipitated many a civil war. And whenever civil war or even insurrection begins, "the public" once more becomes conscious of itself as such, and the political organization of the state is again strengthened.

In a recent study of the present industrial situation in the United States, Mr. Ernest Poole, whose contributions to an intelligent understanding of what is taking place in the labor world are familiar to the readers of THE INDEPENDENT, has put forth the conclusion that "the public" is now really disappearing. Of the fifteen million voters and their families in the United States, seven millions are farmers and farm laborers. Seven millions more are wage earners, and one million are employers, salaried men and the professional classes. Very rapidly the wage earners have been joining the great labor organizations. Recently the employers, in their determination to maintain the open shop, have themselves been organizing, and they are now organizing the non-union labor as a body of "loyal workmen" that can be depended upon under good treatment and steady employment to stand with employers against the tyranny of the trades unions. Social and economic considerations keep the salaried and professional men in sympathy with the employing class. A majority of the American people is thus aligning itself for a class struggle, and there will remain no com-

pact and well-organized group to stand as the representative and defender of common, or public, interests.

This is an interesting view of the existing situation, but we do not believe that it is adequate. We must remember that even if all workingmen were massed in one great organization, and all capitalistic interests in another, each organization would be made up of many grades of character and intelligence. The lowest of these grades would be ready to resort to violent means against which the higher grades would revolt. The moment the class struggle seriously threatened the social order millions of men would awaken to a consciousness of the necessity of preserving the peace and reasserting the supremacy of law and liberty. "The public" would once more become supreme.

Still, it is true that since the public exists to the extent that there are real interests of common concern, its power is weakened to the extent that class interests absorb attention; and to the extent that the public ceases to be powerful the community is liable to suffer from violence and disorder. It becomes a serious question, therefore, whether, as war and the grosser forms of lawlessness become infrequent, the great commercial and industrial interests of mankind are to be given up to class monopolization, with resulting social discord, or are to be controlled as public interests that will resistlessly draw men together in the bonds of commonwealth and harmonious social co-operation.

It is our conviction that if the public is to survive as the supreme fact in human society, if our civilization is not to become a prey to class antagonism, there must be a new creation of great public interests. We can no longer depend, we ought not longer to depend, upon recurring wars to keep alive sentiments of commonwealth, of patriotism. The new public interests must be economic, industrial. For this reason, among others, we hold that such great interests as the means of communication and transportation should become public and no longer class or private concerns. If public sentiment and public opinion are to be stronger than class feeling, and powerful enough to prevent social disintegration through class antagonism, the public interest must be greater than the class interests.

On the Choice of Studies

In our colleges a student learns last what he most needed to know first, what studies to choose. If the Freshman knew as well as the Senior how to learn and what to learn he would waste less time than he does. A man entering college is apt to select his courses from the catalog in much the same way as he chooses his dishes from a restaurant bill of fare; ignorant of gastronomical art, not even knowing the meaning of all the names on the *menu*, he chooses by chance, here a dish because it is well known, there catching at an attractive title, listening to the suggestions, not always disinterested, of the waiter, most of all guided by example and taking the same as his companions at the table. Consequently an instructor one year finds his class overcrowded and rejoices that the educational value of his subject is becoming properly recognized, only to be humiliated next year to find the tide has turned and his lecture room is deserted, equally without reason.

We do not think that the *à la carte* college is, on the whole, inferior or more likely to cause mental indigestion than the *table d'hôte* college, where the same intellectual food is placed before each individual at the dictation of the scholastic *chef*, but it has the obvious disadvantage that the Freshmen are expected to know what no one in the world is wise enough to have yet determined—that is, what knowledge is of the most value. But because nobody can help him much is no reason why he should be left entirely unguided. There should be a preparatory course on courses, a guide to the curriculum, an explanation of the educational content and status of each subject offered; what it is, why it is there, and what benefit the student is expected to derive from it. It is questionable, however, if the curriculum of any of our universities is susceptible of such a clear and logical explanation of form and meaning.

In the absence of more thorough and competent instruction to the student in his choice of electives we venture to offer a few suggestions. It is customary to divide a student's work into two groups,

sometimes called his major and minor; the former a series of correlated studies pursued for several years, the latter composed of shorter and more miscellaneous courses, not necessarily related to each other or to the major. The two lines of work have very distinct aims. The major is for training in efficiency, the minor for the cultivation of comprehension and appreciation. If we use the old saying that an educated man is one who knows everything of something and something of everything, the major group of studies is intended to accomplish the first part of the complete education and the minors the second. The first is intensive education and the second is extensive. The first must be thorough and the second should be comprehensive.

The following rule may be of some assistance in deciding what studies are to be chosen in these two classes:

For major, choose the study you like most.

For minors, choose the studies you like least.

If this formula were printed on the blanks on which the student registers his elections it would save many a blunder of lifelong consequences. Since capacity is rather closely connected with inclination and one generally likes best to do what he can do best, this is almost equivalent to saying that the major should be the easiest course in the curriculum and the minors the hardest.

The student's choice of his major study, the *pièce de résistance* of his college course, is somewhat restricted. Nowadays it is usually a more or less direct preparation for his life work. Even when it has no utilitarian application it is considered to have failed of its purpose unless it is carried far enough and thoroughly enough to result in productive scholarship. Its aim in either case is efficiency, the power of doing some one thing well. The minor studies may be mere accomplishments, but the major must result in an accomplishment. This requires natural ability as well as training, so the major is easily decided upon if the student has a marked talent. If he has not, it does not matter so much what he chooses.

The major course having been fixed upon, it is easy to select the minors, for these should be as different as possible from the first. The major makes the specialist, the minors make the man. The object of the one is strength, proficiency; of the other, symmetry. The minor must be antipodal if it is to balance the major. The minor should be the complementary color in the educational spectrum which, fused with the major, gives the white light of knowledge.

When you report to your gymnasium instructor, he tests you and then prescribes for you exercises which develop your weakest muscles. That is, if the instructor has your interest at heart. If, as many of them do, he aims at high intercollegiate records, he reverses this policy and gives you the exercises which you can best do, and which, therefore, you least need. What you should desire is not to break records, but to develop the body. If your legs are strong, use your arms. If you enter a gymnasium without an instructor, you would not be far wrong if you should try all the apparatus and then stick to those that hurt.

The same rule applies in intellectual training. If you hate mathematics it is a sign that your logical faculty needs developing. Not to study it would be to have an idiotic area in your brain. A disused muscle or organ is liable to become diseased. A disused mental faculty likewise becomes the seat of mental diseases —bigotry, superstition and intolerance.

If your main studies are practical, your subsidiary studies should be the opposite. If you do special work in physics, study also metaphysics. Balance the concrete with the abstract, the utilitarian with the artistic, the modern with the ancient. If you take a literary course, put in plenty of such studies as the sciences where fact outweighs form. Many a literary man has devoted himself so exclusively to acquiring skill in expression that he has found, too late, that he has nothing to express. If you are fond of history or of literature you will not need to do much with them in college, unless they constitute your major, because you will from natural inclination keep up your reading in them sufficiently in after life to be well informed. The college is to do for you what you cannot do for yourself. The practice of electing one's antipathies has a moral value as well. Always doing what you like is as injurious as always doing what you dislike.

Plant-Creation

PLANT-BREEDING is a term coming into common use among enthusiastic fruit growers. Fifty years ago, when Mr. Downing wrote his famous book on fruits and fruit-growing, we had not got beyond the idea that species were something created, and that their limitations could not be broken into. To-day the word *species* stands for little more than *variety*. It means a variety somewhat better established in its habits of growth and fruitage. We are even beginning to hear of two families crossing, and intermarrying, like the cherry and the plum. Mr. Burbank has a new fruit, which he has created out of the plum and the apricot, naming it *plumcot*. Of course, the failures are more numerous than the successful crossings—even where the most skillful art is used. When Mr. Burbank undertook to cross the dewberry with the pollen from the apple, quince, pear, cherry, strawberry and other Rosaceæ stock, he secured something like five thousand seedlings. It was the most curious lot of plants the eye ever rested on; some like raspberries, some like strawberries, and some like the apple. But of all this crowd very few gave any blooms at all, and of those that did only two bore fruit. Of the fruit one resembled a large blackberry and the other a mulberry. Alas! for the experiments; neither of the new fruits bore any seeds. Here was a very promising creation run at once to the ground. Mr. Burbank was compelled to burn up sixty-five thousand hybrids in one bonfire, and he tells us that it took fourteen more bonfires before he had cleared his grounds.

No one must enter the field of plant-breeding without expecting many failures, but if he has one success out of one hundred experiments he may consider himself well repaid. Mr. Burbank has accomplished more than any other man in the world, up to date, along this line of creating new fruits and flowers; perhaps more than all other men put together. He says of his work:

"Preconceived notions and all personal prejudice must be laid aside; we must listen patiently, quietly and reverently to the lessons which Mother Nature has to teach. Man has found at last that he is a part of the universe which is eternally unstable in form, and eternally immutable in substance."

It is with this absolute reversal of the old philosophy of nature that our modern scientific orchardist begins his work. Instead of everything being established and fixed, divided up into species, and our room for experiment confined to modifying varieties, he understands that nature in all her forms is "eternally unstable." With this idea in mind Mr. Burbank went farther and preached the doctrine that there is not one weed or flower, wild or domesticated, which will not, sooner or later, respond liberally to good cultivation and persistent selection. Weeds are weeds because they are crowded, abused and lack encouragement. A few are so fixed in their habits that it is better to select an individual to work upon in a more pliable race; yet, sooner or later, everything on earth will show its capacity for improvement. Now then comes in the glory of manhood. A human being is such by his power not simply to eradicate weeds, but to ennoble them.

Nothing is done by chance or haphazard. Mr. Burbank carefully gathers the pollen from the parent he wishes to accept, and he does this just at the time that the bees begin their work. This pollen he gathers and applies with the tip of his finger—an organ which nature intended to be extraordinarily delicate. The seed resulting from cross-pollination is gathered with great care. The marriage has been accepted by nature, and now comes the determination of the results. As the seedlings grow they manifest more or less of the characteristics of either parent, and sometimes run back to remote ancestors. The interest felt by the experimenter rises to intense anxiety as these young plants grow to blossoming and fruitage. He is happy if even a small percentage manifest a forward step in evolution. This can be secured sometimes only in the second or third generation—that is, by seedlings from seedlings.

It is not difficult for any one to see that after you have broken up two species and mixed their characteristics the amount of permutations may be almost infinite. Break up the hereditary drift, and the recombinations, under influence of environment, must go on until by some means you can stop it. The lima bean, for instance, is very fixed in its hereditary wilfulness; it does not like to cross with other beans,

but when its aristocracy is overcome, and you secure crosses, these crosses must be made stable in order to be valuable. This is another part of the plant-breeder's work. He has now to grow his choice seedlings separate from each other, for a number of generations, until habit again becomes fixed. This difficulty, of course, does not occur in the same way among trees, which are propagated, not by seed, but by cions.

Heretofore nature has had to do her cross-breeding and her pollenizing as she could. It has been said that "Nature abhors above all things inbreeding." For this reason she created bees, and covered them all over with hair, and gave them an instinct to feed on pollen and honey. These little messengers, diving into flower after flower, and distributing the pollen from one to another, have worked out a good many problems, and probably achieved some very remarkable results that we attributed to supernatural power. Hereafter evolution will be in the hands of man. New plants, new flowers, new fruits of higher quality and greater beauty will be the law. The time is not far distant when every horticulturist will consider himself a failure if he does not do more than simply cultivate; he must also create. Young people will find in the country a field for thought and work unequaled elsewhere.

Mr. Roosevelt's Notification

President Roosevelt's reply to the gentlemen who formally notified him of his nomination is to be supplemented by a fuller exposition of his views on public matters and the principles of the Republican Party in accordance with which he would have this Government administered. The journals that oppose his election, the *Daily Scolds* and the *Evening Sniffs,* find it hard to discover anything to criticise in what he said; they declare that he has discovered a new tone to his voice and is cooing "down so." He says truly that in these years the party entrusted with the Government has pursued a positive and steady policy. It has not been silent or wrong on vital questions. The currency question is settled in the gold standard, with no wavering, and against the opposition of the other party. It is a matter of pride that fifty millions of money could be paid for the Panama Canal and yet leave a surplus for the last year of nine millions in the Treasury. That Isthmian Canal is a magnificent achievement of this administration, sufficient to justify popular approval and re-election. We may say the same of our treatment of Cuba, keeping our promise to her and giving her independence. Even warmer praise does the administration deserve for its steady removal of the rule of the Philippines from the military arm and giving it to the civil power, in which the people themselves have a large and increasing control. Our benevolent purpose in governing the Philippines for the Filipinos could not be better expresed than it was by Mr. Roosevelt:

"We are governing the Philippines in the interest of the Philippine people themselves. We have already given them a large share in their government, and our purpose is to increase this share as rapidly as they give evidence of increasing fitness for the task. The great majority of the officials of the islands, whether elective or appointive, are already native Filipinos. We are now providing a legislative assembly. . . . We have established in the islands a government by Americans, assisted by Filipinos. We are steadily striving to transform this into self-government by the Filipinos, assisted by Americans."

We declare that the record is true and one to be proud of.

The Other Side

There are other minor portions of the record of the Republican Party that Mr. Roosevelt was obliged somewhat to gloss over. He knows quite well that its record on reciprocity is very imperfect. All he can claim is that we have ratified a reciprocity treaty with Cuba; all the others have been ruthlessly and discourteously shelved. As was to be expected, he defends protection; indeed, both parties do so in a measure, but the revision of the tariff needed to prevent those great abuses by which other nations get our products at cheaper rates than do our own people has not been even attempted. Nor can we see it true, beyond the Northern Securities case, that our Government has been in serious earnest in trying to enforce the laws, wise or unwise, which forbid the interference by the trusts with free competition. Yet Mr. Roosevelt has

enough to show and commend to warrant him in appealing to the people with confidence for re-election. Indeed, we remember that he has been President only by the accident of the death of the man whom the people had chosen. If elected next November Mr. Roosevelt will feel that the people now give their confidence to him, and we believe that he will meet that confidence, and that we may expect some proper revision of the tariff, within the principle of protection, more reciprocity treaties, a development of Philippine self-government, and a prudent and courageous home and foreign policy. His opponents delight to picture Mr. Roosevelt as a wild, reckless, self-confident leader. The fact is that he is thoughtful, wise and actuated by the highest purpose. To be sure he does things, but they are things worth doing.

France and the Pope

We are within short hoping distance of the grandest internal revolution the friends of France have looked for since 1870. There is likely to be speedy separation of Church and State in the Republic which had already separated itself from the Empire. Even a cat and a dog can doze peaceably by the same fireside as long as their tails are not tied together, and in this country Church and State live in peace and mutual good will, only because they have separate spheres and neither tries to rule the other. It is not so in France, and the tying of the two under the Concordat was sure to make trouble sooner or later. Because the Republic paid the stipends of priests and bishops, she felt she had the right to interfere with the ecclesiastical schools and orders. Because she did this President Loubet could not visit the Pope when he went to Rome. Because he did not visit the Pope, Pius X sent a letter of strong complaint to the Catholic Governments. Because of that letter the French Ambassador to the Vatican was recalled. Because the Concordat distinctly declares that no orders from Rome can be sent to or executed in France except by the authorization of the French Government, the Vatican could not legally direct or advise the Bishop of Laval to resign, nor the Bishop of Dijon to intermit his functions, and ask both bishops to come to Rome for investigation. Because the Vatican nevertheless did these things the French Government has demanded that these letters be recalled and has forbidden the bishops to leave their dioceses, under another provision of the Concordat which says that "the bishops must reside in their dioceses" and "must not leave them without the permission of the First Consul." And now, because the Vatican refuses to reverse its action aad apologize, and has required the bishops to go to Rome on pain of the major excommunication, and one or both have gone, the French Government has withdrawn its Embassy from the Vatican, and proposes to abolish the Concordat. We should think the Pope would be delighted. He evidently does not shrink from this result. It is a ridiculous position that he has been in, under which he cannot summon a bishop to Rome, or remove him from office, no matter what scandals have arisen, without the permission of the French Premier, who may be a Protestant or an Atheist. The Pope says he would rather yield the Concordat than his liberty of disciplinary government, and he is right. Equally the French Government ought to be glad to get rid of the compromising agreement made in the time of Napoleon by which it is as much held in fetters as is the Church itself.

If the two wings of the Democratic party would flap together in agreement as to Mr. Roosevelt's attitude toward Trusts, some confusion might be avoided. One denounces his failure to enforce the Anti-Trust law and attacks the Department of Justice for declining to "run amuck" among the combinations. The other holds that he has already gone altogether too far in Trust prosecutions, referring, of course, to his successful suit against the railway combination in the Northwest. We shall know, by and by, which of these two views is in accord with Judge Parker's.

They say that the sentiment for the prevention of cruelty to animals has so advanced in Spain that in one town they got up a bull fight to raise money for it.

Insurance

European Investigation of American Fire Protection

Mr. Victor E. Rhodin, prominently identified with fire insurance in Stockholm, Sweden, recently visited this country with a view of determining the advisability of his company, the Skandia, of Stockholm, continuing to write large American reinsurance lines. Mr. Rhodin's visit in this connection came about as one of the results of the Baltimore conflagration. While in America he visited New York, Rochester, Buffalo, Philadelphia, Baltimore, New Orleans and other large cities for the purpose of studying municipal fire conditions, and he is inclined to take the view of an alarmist. He stated in a published interview that from his observations a fire like that of Baltimore is likely to occur in any of the cities he has visited. American building laws seem lax to him and do not compare favorably with those of most of the European countries. He was impressed by the fire departments of the larger American cities, but expresses the opinion that they are handicapped by the lack of fire fighting facilities due to the many sky scrapers that have become features in most of our cities. Narrow streets, yard room that is largely lacking, and a water supply that is altogether inadequate are among the things that conspire to bring this all about. According to Mr. Rhodin we need wider streets, lower buildings and more yard room. A far more crying need is, however, better building laws and a more pronounced regard for the safety of business and public structures. Our fire walls are by no means what they ought to be. The criticism of the gentleman from Stockholm should not be too lightly dismissed. He may be right.

Partnership Insurance

Partnership insurance has lately been received with growing favor. When its value as a safeguard against losses that will come in spite of all care in case of the death of one of the partners in a given business is considered it is somewhat surprising that it lingered so long in popularity. The death of the active manager of any business is sure to be followed by more or less demoralization in the department that has been under his especial care until a competent successor can be found to take his place. This opens a door to financial losses which partnership insurance is designed to offset. It is doubtless true that many business men who have made adequate provision for their families in case of their death, through the agency of life insurance, have never had this adaptation of life insurance brought home to them. Partnership insurance has great possibilities and the capable agent will find therein a wide field that has not by any means been fully harvested.

For Those Wishing to Live One Hundred Years

Sir James Sawyer, an English physician, has formulated the following nineteen rules for prolonging life to 100 years:

1. Eight hours' sleep.
2. Sleep on your right side.
3. Keep your bedroom window open all night.
4. Have a mat to your bedroom door.
5. Do not have your bedstead against the wall.
6. No cold tub in the morning, but a bath at the temperature of the body.
7. Exercise before breakfast.
8. Eat little meat and see that it is well cooked.
9. (For adults.) Drink no milk.
10. Eat plenty of fat, to feed the cells, which destroy disease germs.
11. Avoid intoxicants, which destroy those cells.
12. Daily exercise in the open air.
13. Allow no pet animals in your living rooms. They are apt to carry about disease germs.
14. Live in the country if you can.
15. Watch the three D.'s—drinking water, damp and drains.
16. Have a change of occupation.
17. Take frequent and short holidays.
18. Limit your ambitions; and
19. Keep your temper.

The Equitable Life Assurance Society celebrated last week the forty-fifth anniversary of its organization by a dinner at the Lawyers' Club, at which Gage E. Tarbell, Second Vice-President and founder of the college class of life insurance, presided.

Financial

To Foreign Shipbuilders

In Cleveland, a few weeks ago, the Merchant Marine Commission was told by Vice-President Wallace, of the American Shipbuilding Company, that the United States Steel Corporation was selling to shipbuilders at Belfast, for $24 per ton, steel plate for ships that was sold to our own shipbuilders at not less than $32, delivered at the Pennsylvania mill. Now comes the New York *Journal of Commerce* and asserts in its trade reports of Saturday last that several thousand tons of steel plates for ships have very recently been sold, for delivery at Newcastle-on-the-Tyne, at a price netting the mills about 90 cents per hundred, or only $18 per ton, at Pittsburg, "against $1.60 per hundred [or $32 per ton] for domestic business." This price is almost exactly half of the price of such ship steel delivered at New York. The manufacturers of such steel are, as a rule, in favor of ship subsidies to compensate for the lower cost of construction in foreign yards.

Steel Corporation Earnings

When the directors of the United States Steel Corporation declared, last week, the regular quarterly dividend on the preferred stock, they issued a statement of earnings which has been read with much interest. Net earnings in the first quarter of the year were only $13,208,886, which caused a deficit of nearly $2,000,000 to be shown after payment of the dividend and fixed charges. For the recent quarter they rose to $19,490,725, so that a surplus of $2,777,644 remained after the payments. This increase might be regarded as evidence of improved conditions in the industry, were it not for the decline of orders on hand and the fact that the year's second quarter has been much better than the first since the Corporation was established. The unfilled orders on hand, on June 30th, were only 3,192,277 tons, against 4,136,961 at the end of March and 4,666,578 on June 30th, 1903. The reports show that the quantity declined to 3,215,123 tons on December 31st, rose to 4,136,961 on March 31st, and now has fallen again to 3,192,277, a level not heretofore reached. The increase of net from the first to the second quarter of this year, about 47½ per cent., may be compared with an increase of 46 per cent. in 1903 and of 41 per cent. in 1902. There are signs, however, of some improvement in the condition of this important industry, especially in the demand for pig iron and structural steel. A reduction of high pool prices would assist in imparting needed vitality to the trade.

Connecticut papers say that the New York, New Haven & Hartford Railroad Company will in a short time own a complete trolley line from Worcester to the sea at New London.

....The taxable value of the late William C. Whitney's estate is $21,234,101. It includes no stock of the New York street railways, with which he was so intimately connected, but the largest item is $7,078,400 in shares of the Standard Oil Company.

....The Interstate Commerce Commission's statistics for the year ending June 30th, 1903, issued recently, show that the railway capital then outstanding was $12,599,990,258. There were 205,313 miles of track.

....Col. Charles E. Sprague, President of the Union Dime Savings Institution, is about to publish (besides his book on "The Accountancy of Investment") a book on Bond Values, much more extensive than those now in use. While the ordinary tables give values correct to the nearest cent on $100 only, his forthcoming book will give the nearest cent on $1,000,000, and will show the rates of income (2.50, 2.51, 2.52, etc.) from 2½ to 5 per cent. These new tables will facilitate the keeping of investment accounts on scientific principles, and be useful with respect to transactions in securities.

....Dividends announced:

Buffalo, Rochester & Pittsburg R'way, Preferred, 3 per cent., payable August 15th.

Buffalo, Rochester & Pittsburg R'way, Common, 3 per cent., payable August 15th.

The Independent

Vol. LVII NEW YORK, THURSDAY, AUGUST 11, 1904 No. 2906

Survey of the World

Senator Fairbanks Notified by Mr. Root

Formal notification of his nomination was given to Senator Fairbanks at his residence in Indianapolis on the 3d inst. by ex-Secretary Root and a committee. Mr. Root said that the nomination had not been the chance product of an excited hour. Nor had it been made for the purpose of conciliating possible malcontents or to swell the party's campaign fund. "No suppressions of the truth or misleading of the convention as to your principles and opinions were necessary to bring it about." Too often it had happened that the candidate for Vice-President had been selected from a faction defeated in an exciting contest for the first place, to appease their resentment, and that after election he had been antagonistic in spirit to the President; but such was not the case now. Speaking of the supreme responsibility of the Vice-President in case of succession to the Presidency, and pointing out that of the last twelve Presidents elected by the people five had died in office and been succeeded by Vice-Presidents, he directed attention to the serious obligation of a political party to nominate for this office a man having the strength of body and mind and character to enable him to endure the exhausting demands of the Presidential office and meet its great responsibilities:

"Our opponents of the Democratic party have signally failed to perform this duty. They have nominated as their candidate for the Vice-Presidency an excellent gentleman, who was born during the Presidency of James Monroe, and who before the 4th of March next will be in the eighty-second year of his age. Before the next Administration is ended he will be approaching his eighty-sixth birthday. It is no disparagement of this gentleman, for whom I believe we all have the highest respect, to say that he shares the common lot of mortals, and that the election of any man of such great age would furnish no safeguard to the American people against the disaster which would ensue upon the death of a President with a successor not competent to perform the duties of the Presidential office. It is common experience that very aged men, however bright and active they may appear for brief periods, cannot sustain long continued severe exertion. The demands of the Presidential office upon the mental and physical vitality are so great, so continuous and so exhausting as to be wholly beyond the capacity of any man of eighty-five.

"The attempt of such a man to perform the duties of the office would with practical certainty be speedily followed by a complete breakdown both of body and of mind."

As a "necessary result" of the election of Mr. Davis (in case of the President's death), "others, not chosen by the people, and we know not who, would govern in the name of a nominal successor unable himself to perform the Constitutional duties of his office; or, worse still," it might be "that serious doubt whether the Vice-President had not reached a condition of 'inability' within the meaning of the Constitution would throw the title to the office of President into dispute." On the other hand, Mr. Fairbanks was in the full strength of middle life, clearly possessing both the ability and the character to "govern wisely and strongly" if he should become President. In his brief response, the Senator expressed his approval of the monetary, economic and other policies of the platform. The party, he said, had never rendered a more important service to the country than when it established the gold standard; and it was gratifying that the convention had made frank and explicit

declaration of the party's inflexible purpose to maintain it:

"It is essential not only that the standard should be as good as the best in the world, but that the people should have the assurance that it will be so maintained. The enemies of sound money were powerful enough to suppress mention of the gold standard in the platform lately adopted by the Democratic national convention. The leader of the Democracy in two great national campaigns has declared, since the adjournment of the convention, that as soon as the election is over he will undertake to organize the forces within the Democratic party for the next national contest, for the purpose of advancing the radical policies for which his element of the party stands. He frankly says that the money question is for the present in abeyance. In view of these palpable facts, it is not the part of wisdom to abandon our vigilance in safeguarding the integrity of our money system. We must have not only a President who is unalterably committed to the gold standard, but both Houses of Congress in entire accord with him upon the subject."

The wisdom of the protective policy, he continued, found complete justification in the industrial development of the country. This policy must be maintained unimpaired. "When altered conditions make changes in the schedules desirable, their modification can be safely intrusted to the Republican party." The election of Mr. Roosevelt was "imperatively demanded by those whose success depends upon the continuance of a safe, conservative and efficient administration of public affairs." "The charges made against him in the Democratic platform," said the Senator, "find an irrefutable answer in his splendid administration, never surpassed in all the history of the republic, and never equaled by the party that seeks to discredit it."—Altho Mr. Root, in letters addressed to party leaders, has virtually declined to permit the use of his name in connection with the office of Governor of New York, there appears to be so urgent a demand for his nomination that he may not be able to resist it. On the other side there is talk about the possible nomination of Daniel S. Lamont, another ex-Secretary of War. Eugene A. Philbin, a Democrat, formerly District Attorney of New York, and Charles H. Leeds, the Democratic Mayor of Stamford, Conn., make known their purpose to vote for Mr. Roosevelt.—Some weeks ago an order was issued, assigning Brigadier-General Funston to the command of the Department of the East, with headquarters at New York. It has now been annulled. Brig.-Gen. Frederick D. Grant will take command at New York, and General Funston will go to Chicago. The assignment of the latter to the important Department of the East had excited some criticism.

udge Parker Resigns

Judge Parker resigned the office of Chief Judge of the New York Court of Appeals on the 5th inst., after a brief session of the court, called at his request by a vote of a majority of the judges. Sixty-six decisions were handed down, and thus all the cases were completed in which his opinion and vote were required. A new Chief Judge will be appointed by Governor Odell, but will serve only until January 1st, for Judge Parker's successor will be elected in November. The names of the Executive Committee and other officers appointed by Chairman Taggart excite some interest, as indicating the influences now dominant in the management of the Democratic party. The members of the committee are William F. Sheehan (chairman), a lawyer interested as counsel and director in municipal lighting and railway corporations; August Belmont, the well-known banker, representing the Rothschilds and head of the New York Interborough Railway; John R. McLean, of Washington, owner of the Cincinnati *Enquirer;* Senator Martin, of Virginia; Col. J. M. Guffey, of Pennsylvania, owner of many coal mines and oil wells; ex-Senator James Smith, Jr., of New Jersey, banker and leather manufacturer; Timothy Ryan, lawyer, of Wisconsin. The vice-chairman is De Lancey Nicoll, formerly District Attorney of New York, and now counsel for prominent corporations, including the Consolidated Gas Company and Metropolitan Street Railway. George Foster Peabody, who takes the office of Treasurer, is a prominent banker, was the treasurer of the Palmer and Buckner Democrats, is well known in connection with philanthropic and educational interests, and is a director of many railroads and other corporations, including the American Beet Sugar and General Electric companies. There ap-

pears to be no Bryanite element in the organization, but Mr. Peabody recently remarked that the Republican party had "wholly surrendered to the so-called plutocracy." Tammany at a public meeting has formally ratified the national convention's nominations and promised to give Judge Parker an "overwhelming majority" in New York. Leader Murphy still protests, but in vain, against the placing of his foe, McCarren, at the head of the State Executive Committee.—J. A. Parker, of Nebraska, a member of the Populist Executive Committee, says that thousands of Bryan Democrats have announced their purpose to support the Populist ticket. In West Virginia, Asbury Parsons, Republican nominee for judge of the Circuit Court, gives notice that he will vote for Parker and Davis. He was formerly a Democrat. John S. Carr, Republican nominee for Presidential elector in the same State, has withdrawn from the ticket, saying that he cannot conscientiously vote for the Republican candidates.

State Conventions

Democratic conventions were held last week in several States. Ex-Senator Davis's influence was dominant in West Virginia, where, at his request, a "white man's" plank was left out of the platform, altho a large majority of the delegates were in favor of it, and he himself said: "I certainly agree with you on the white man proposition." The excluded resolution declared the destinies of the State must be shaped and controlled by the whites, and announced a fixed purpose to "preserve the social and political supremacy of our own race." In his opening address, Chairman McGraw attacked Mr. Roosevelt for "reopening the wounds of the Civil War by breaking bread under the national roof with one whom God had not made his social equal." In the Texas convention, ex-Governor Hogg expressed his admiration for Mr. Roosevelt and called Judge Parker "the lockjaw candidate." It is said that he will strive to organize a new party of farmers and laborers. A fusion of Democrats and Populists in Nebraska is said to involve the support of Mr. Bryan for the Senate. In Kansas, a fusion was reached after some delay. The Populists are now a small minority there. A few of them bolted the convention, but, conscious of their weakness, decided to make no fight. In Indiana, the Democrats nominated for Governor John W. Kern, who says many Republicans have told him they will vote for Parker and himself. The Democrats of Washington nominated ex-Senator George Turner, on a platform calling for a railroad commission and direct primaries. "The paramount issue" in that State, it says, "is whether the people are to regulate the railroads or the railroads are to regulate the people." The Republican party there is divided on the question of a railway commission. In Michigan, some expected that the Democrats would nominate Justus S. Stearns, who has twice been a prominent candidate in the Republican party for Governor as an advocate of primary reform, and who was ready to accept the convention's support. But he was beaten by Woodbridge N. Ferris, who had 412 votes to Stearns's 329. The platform calls for the direct nomination of all candidates.

The Strikes and Lockouts

Another contest between the builders of New York and the workmen of the building trades was begun at the end of last week. At the close of the memorable controversy in 1903, which caused a suspension of work on $90,000,000 worth of buildings for several months, an agreement was reached by the several unions and the Employers' Association, providing for the arbitration of every grievance and dispute, and also for the employment of union men only, when enough of them could be obtained. By this agreement the walking delegates —three of whom were sent to the penitentiary—lost much of their power. Within the last few weeks the arbitration agreement has repeatedly been violated by several of the unions. Strikes have been ordered at several large buildings for trivial causes; work on the subway has been stopped by a strike. It is admitted by certain union leaders that they desire to get rid of the arbitration agreement. After several conferences and at-

tempts to restore peace, the Building Employers' Association, on the 4th inst., gave formal notice that all the unions on strike would be locked out if they should not return to work on the following day. They did not return, and at last accounts 32,000 skilled workmen were out. Work has been stopped on the Public Library and scores of school buildings, as well as upon many large private structures. Owing to a rumor that the employers desired the "open shop," their officers deny this in public statements, saying that a large majority of them desire and prefer to deal with union labor.—During last week the Chicago packers steadily increased the number of their non-union employees, until, having about 16,000 of them, they asserted that no more unskilled workmen were needed. Among those brought to the packing houses were a considerable number of immigrants who had just arrived at New York. Not many union men have resumed work in Chicago, but in Kansas City and St. Joseph the union ranks have been broken. In Chicago skilled workmen are needed by the packers, who appear to be doing less than one-half of the normal amount of business and to be avoiding, by necessity, the utilization of by-products. At Sioux City there has been much disorder, owing to assaults upon non-union men and to a conflict of authority between the police and the sheriff's forces, the police appearing to sympathize with the strikers. At South Omaha, where the packers and local authorities asked for troops, Governor Mickey, in the garb of a laborer, joined the strikers and remained with them for several hours, accompanying them when a carload of non-union men arrived. Laying aside his disguise, he announced that no troops would be sent so long as the strikers should persist in the orderly behavior which he had witnessed. The 300,000 members of the Chicago Federation of Labor have expressed their approval of the strike and are to be assessed for a weekly contribution in support of the strikers.—A strike of 80,000 anthracite miners, for which an order was ready to be issued, appears to have been prevented. The Strike Commission's decision provided that at each mine there should be a check weighman, if a majority of the miners should ask for one, and that he should be paid by assessment upon the men. The miners held that the tax should be levied upon all the employees; the companies insisted that it should be paid only by the majority that asked for a weighman. Colonel Wright, as umpire, decided that all should pay. The companies would not accept his decision. Some say that they objected because payment of the tax by every miner would tend to connect every miner with the union. To enforce the umpire's ruling, the unions voted for a strike. Then the companies proposed that the controversy be submitted to Judge Gray. It is expected that this compromise will be accepted.—The Pullman Car Company's works are soon to be closed for lack of orders, and 6,000 men will be idle. For the same reason work has been suspended at the slate quarries in Bangor, Pa., where 2,000 men were employed. A cotton mill at Lowell, employing 1,600 hands, will be closed for a month. The Worthington Pump Company, at Elizabeth, N. J., has reduced wages by 10 per cent. At Fall River, those cotton mills which were deserted by the 25,000 employees now on strike remain closed.

Countries South of Us

Minister Bowen has addressed to President Castro a strong protest against his seizure of the property of the New York and Bermudez Asphalt Company in Venezuela. Mr. Bowen's report to the State Department shows that the pretext for the proceedings against the company was not (as originally stated) an allegation that by assisting the revolutionists the corporation had increased by $9,650,000 the cost of subduing them, but that the Government asked the court for an embargo (equivalent to an injunction) and for the appointment of a Receiver, on the ground that the company had failed to comply with certain requirements of its concession relating to the digging of canals, the dredging of rivers, and the exportation of products other than asphalt. An embargo was promptly laid by the court, and a Receiver was at once appointed. He sailed on a Venezuelan war ship for the asphalt lake before any notice of the suit or proceedings had been served on the company. This suggests

collusion between President Castro and the court. Mr. Bowen says that while the laws authorize proceedings for an embargo in the case of an ordinary lease, the same method is not really applicable to a corporation holding under a concession. The British Minister has entered protest, as bonds of the company to the amount of $1,000,000 are held in England. From unofficial sources it is intimated that when he was engaged in subduing the revolt, Castro made promises that involved a transfer of the asphalt concessions to persons or corporations that gave him assistance.—The work of the mixed commissions for the adjudication of claims against Venezuela is finished. To Italian claimants, who asked for $6,000,000, about $600,000 has been awarded.—Formal protest has been made at Washington by the Minister of Panama against the Commission's interpretation of the Canal Treaty, especially concerning the application of the Dingley tariff and the creation of a port of entry at Ancon, which, it is said, diverts trade and revenue from the port of Panama.—From Haiti, disorder is reported in Port-au-Prince and other towns, where Syrian shopkeepers have been attacked by soldiers and other natives. It is said that there are in Haiti 15,000 Syrians, who claim to be American citizens, and that the native retail merchants suffer by reason of their competition.

Opium in the Philippines

A committee was appointed at Manila in August last to inquire as to the laws and conditions governing the opium traffic in Oriental countries, and to report a plan for the control of it in the Philippines. It had been proposed by the Philippine Commission that the traffic should be a monopoly and should be sold to the highest bidder. But the Commission's bill for this solution of the problem was so vigorously opposed in this country that it was withdrawn, and provision was made for an investigation by a committee composed of Bishop Brent, Dr. Albert and Major Carter, president of the insular Board of Health. These investigators have made inquiry in China, Burmah, Siam, and Japan. They now recommend that the opium traffic be at once made a Government monopoly; that after three years the importation of opium, except for medicinal uses, be absolutely prohibited; that smokers' licenses be issued only to those persons, over twenty-one years of age, who are confirmed users of the drug; that a campaign of education against the use of opium be started in the schools; that free treatment in the Government hospitals be given to those who use the drug, and that all Chinese who violate the proposed laws and regulations be punished by deportation. — Governor Carter, of Hawaii, has been interviewed in California concerning the condition of the Hawaiian Islands. Annexation, he says, has not been a commercial success, partly because the laws by which the islands are governed are not adapted to their needs. It has cut off all their internal revenue, but the Treasury at Washington has received $6,250,000. Congress has not dredged the harbor of Honolulu, which is filling up. The land laws of the United States prevent the leasing of Government land for more than five years in a single term. Land is not taken for so short a period, owing to the time required for raising staple crops.

The Combes Administration

The address of M. Combes at Carcassonne is of especial interest, because it gives an outline of the policy of the dominant party in France, and sums up what the leader of that party regards as having been accomplished for the benefit of the country. We therefore quote in his own words the following summary:

"We have assumed the responsibility of direction of public affairs solely in order to realize a determined program, of which France already knows the main lines: before all and above all the complete secularization of our society by the complete victory of the lay spirit over the clerical spirit; in the second place, the reform of our military organization and the reduction of the duration of the service to two years; in the third place, the introduction into our financial legislation of imposts upon the revenue as corrective of the inequalities and injustices of our fiscal *régime;* in the fourth place, the passage of laws for the assistance of the workingmen and the establishment of old

age pensions for them, aims which have been always understood and which have been in a sense the object of all the laws, projects and propositions of laws of social order, which have secured or retained in the last fifteen years the solicitude of the republican assemblies.

"The ministry has devoted itself assiduously to the execution of this program. It has accomplished the first part; five hundred congregations of men and women have been surpressed, twelve thousand congregationalist establishments have been closed. The reduction of military service has been voted by both Chambers, and is only delayed for final deliberations on some questions of detail. The Government has set a day immediately after the opening of the Extraordinary Session for discussion for the impost upon the revenue. The month of January has been fixed for the debate on pensions for the laboring classes. One other question, a very important question in the relations of Church and State, presents itself together with the two first and with great urgency. Recent incidents have thrown upon it a startlingly bright light. They are of a nature to favor that solution which is wished for by the whole Republican party. If our internal policy, financial and other, defies the impartial critic, our foreign policy is the object of envy, and I may say of admiration, to the entire universe. We are not dreaming, as are others, of the glory of battle. We are not seeking warlike adventures and colonial conquests. We have the modesty to think that we are acting wisely in utilizing the territories acquired before thinking of other aggrandizement."

That M. Combes's policy still commands the support of the majority of the French people is shown by the result of the elections held a week ago to choose off the members of the General Councils of the department. There are fifteen hundred seats to fill, and the results of the election are as follows: Ministerial Republican, 841; Anti-Ministerial Republican, 312; Conservatives, 175. That is to say, "out of every four French Councillors General three are Republicans, and out of these three two are supporters of the Government."

The British Reach Lhasa

The British Mission in Tibet left the camp at Gyangtse July 14th and reached the sacred capital of Buddhism on August 3d. No effective opposition was made by the Tibetans to the British advance, altho the force had to traverse two easily defensible passes, the Karo-la, altitude 16,600 feet, and the Kamba-la, altitude 14,950 feet, and it was necessary to cross the Tsang Po River, 400 feet wide, by the old chain bridge. There was a feeble attempt to stop the British at the Karo Pass by the erection of two walls across the road 200 yards apart. A large number of Tibetan soldiers were assembled behind these and also posted on the tops of the high cliffs of reddish limestone on each side of the pass. The Gurkhas, however, climbed the precipice on the south, a hight of 1,000 feet, to the snow-cap, and cleared the crest, when the Tibetans abandoned the fortifications and, as stated in the dispatch, most of them escaped. The British loss was one native killed and one wounded. The following day the Ta Lama and other dignitaries met Colonel Younghusband at a durbar lasting three hours. The delegates refused even to consider the surrender of the Jong or castle of Nagartse, but they were informed that it was already in the possession of the Pathans, who found it unoccupied. The discussion was renewed on the next day, but was absolutely fruitless, as the Tibetans merely reiterated their threats and demands that the British retire to Gyangtse on the ground that Lhasa was a purely religious capital and did not concern itself with civil affairs. On the approach of the expedition toward Lhasa the Dalai Lama did not die of a broken heart on this profanation of the sacred city, as his followers foretold, but took refuge in a monastery eighteen miles distant, refusing to see even the highest state officials and declaring his intention of remaining in seclusion for three years. The Amban, the Chinese representative at the Tibetan court, paid a ceremonial visit to Colonel Younghusband, bringing gifts of food, and promised to assist in arriving at a settlement. The British expedition is encamped close to the private gardens of the Dalai Lama and a mile from the sacred mountain of Potala, on which stands the palace of the Dalai Lama. Since no Europeans have succeeded in entering the city for a hundred years, except Manning in 1811 and Huc and Gabet in 1846, the reports of the English correspondents will be of very great interest.

Contraband of War

The British Ambassador at St. Petersburg has protested against the inclusion by Russia of foodstuffs in the list of articles declared contraband. It is claimed that cotton should be so declared only when it is intended for the manufacture of gun cotton. The prize court at Vladivostok has adjudged the sinking of the steamer "Knight Commander" justified since an examination of the ship's papers showed that the cargo consisted largely of railroad material consigned through a Japanese port to Chemulpo, and was apparently intended for use on the military railroad from Seoul to the Yalu River in Korea. The Russian justification of the confiscation of foodstuffs, as in the case of the "Arabia" from Portland, is semi-officially stated in these words:

"Foodstuff consigned to an enemy's port in sufficient quantity to create the presumption that it is intended for the use of the Government's military or naval forces is *prima facie* contraband and sufficient to warrant holding it for the decision of a prize court. Even if consigned to private firms the burden of proof that it is not intended for the Government rests upon the consignor and consignee. If it can be proved that it is intended for non-combatants it will not be confiscated. Small consignments of foodstuff in mixed carges will be considered presumptively to be regular trade shipments, and will not be seized as contraband."

—The report of the death of the assassin of De Plehve is denied. He has refused to give his name and has not yet been identified. It is thought that M. Muravieff, Minister of Justice, will be appointed in the place of the murdered Minister of the Interior.

Port Arthur and Niuchwang

There was heavy fighting around Port Arthur on July 26th and the two days following, but little can be said with certainty about the results. The Japanese claim to have captured Wolf Hill, an important point in the defenses of the city, since it is near the railroad and within two miles of the main fortifications. According to General Stoessel, the Russian commandant at Port Arthur, the Japanese have been repulsed in all their assaults on the outposts with the loss of 10,000 men. The fleet assisted in the defense by bombarding the Japanese flank. The Russian loss in the fighting of the last of July is reported by him to be 1,500 men and 40 officers, killed and wounded. The Russian trenches extended over a length of 16 miles and for two days and a half these were subjected to a furious and well directed fire from the Japanese artillery. The Russians returned the fire but feebly, probably because of shortage of ammunition. When, however, the Japanese infantry charged they were met with a concentrated and very destructive fire, against which they steadily advanced for an hour. On the night of August 1st a flotilla of twelve torpedo boat destroyers, four torpedo boats and some gunboats emerged from the harbor at Port Arthur, but they were detected and driven back by the Japanese guard ships outside.—The Japanese are now in full possession of Ying-Kau and Niuchwang and have opened the port to the trade of neutral ships and individuals. Ten electric mines were removed from the Liao River. A Japanese battle ship, a cruiser, three gunboats and a torpedo boat have been sent to Niuchwang. The French consular agent there has been arrested by the Japanese on account of his vigorous protest against the detention of two sailors who claimed French protection. A large depot of army supplies has been established by the Japanese at the old Russian railroad station, guarded by 2,000 troops. The Russo-Chinese bank at Niuchwang has been taken possession of by the Japanese, but it has not yet been decided whether they will regard it as spoils of war or as neutral property.

Closing Around Liao-Yang

The movements of the past week have been rapid and momentous. Two important battles have been won by the Japanese. General Oku attacked and drove back the Russians' center at Simuchen on the south, and General Kuroki forced the pass of Yangtse on the Russian left. Since he was thus in danger of being cut off, General Kuropatkin abandoned Hai-Cheng and retreated to Liao-Yang, which is now defended by a semicircular line of fortifications at an average distance of about fifteen miles south of Liao-Yang as a center. In the capture

of Simuchen the Russian loss is estimated at 2,000. The Japanese sanitary corps buried 700 bodies found in the valleys through which the Russians retreated. The Japanese captured six guns, 570 shells, a quantity of stores and 33 prisoners. The Japanese loss was 860 men. Yangtse Pass, thirty miles east of Liao-Yang, was attacked by General Kuroki on July 29th, and Lieutenant-General Count Keller, in command of the First Siberian Army Corps, was killed by a shell in the first engagement. The Pass was strongly fortified, but was carried by the same combination of effective artillery fire and fearless charges which had been so successful previously in capturing Mao-Tien Pass. The thermometer registered 110 degrees Fahrenheit, and the soldiers suffered severely. General Kuropatkin is estimated to have about 200,000 men for the defense of Liao-Yang to withstand an equal force of Japanese. The Russian position south of Liao-Yang is a strong one. The center is at Nanshan (Anshanshan), on the railroad. On the Russian right is a level plain, where the Russian Cossack cavalry can be used with full effect, while the left flank on the east is protected from General Kuroki by a river and marsh. A line of precipitous hills fifteen miles long, stretching east and west from Nanshan, forms the Russian front. So far only small bodies of Japanese skirmishers have crossed the Taitse River, but a strong movement toward Mukden may coincide with the attack on Liao-Yang. General Kuropatkin has lost a large amount of military stores in his retreat from Kaiping and Haicheng, but Liao-Yang is a much more important base of supplies, and a defeat here would be disastrous.

Map of the Seat of War.—The Japanese have advanced beyond Haicheng and Simuchen. The Russian front is at Nanshan.

Organized Wealth and the Judiciary

BY DAVID J. BREWER, LL.D.

Associate Justice of the Supreme Court of the United States

IN a recent address before the graduating class of the Albany Law School I numbered among the sources of temptation which surround the legislator the power of corporate organizations. In the possession of the corporations of the land is centered largely its wealth, and money brings power. If I remember rightly, the late Mr. Gould, in testimony given before a Committee of Congress soon after the famous "Black Friday," when asked why he sought to accumulate money, said that it was because he wanted power. I did not in my address r fer to the grosser matter of the direct purchase of a legislator's vote, but to that insidious influence which results from the power of corporations largely to affect his future political life. Not only do corporations possess enormous wealth, but in the prosecution of their business activities they have a multitude of subordinates, who, acting together, create a formidable body in the community and can largely determine political results.

Does a like temptation attend the relation of corporations to judges? We pride ourselves, and rightly, in this country upon the personal integrity of our judges. Singularly few are the instances in which the direct use of money is charged or even suspected, but it must be conceded that there are good citizens who are apprehensive that the same insidious influence which corporations sometimes exercise over legislators is also exerted over judges. We all know that electing one to judicial office does not change his character or increase his wisdom. Election is not a work of moral reformation, and the judge is substantially the same man after as before it. True there is quite a common feeling that a judge is possessed of superior wisdom. Somehow or other a community which may not think very highly of one as a practicing lawyer comes to look upon him with respect when elevated to the judicial office. It may not be wholly conscious of the change of sentiment; yet it exists. It is perhaps more a tribute to the office than to the man, tho doubtless any high-minded man (and no other is fit for a judicial office) when elected to one is impressed with a sense of his responsibility, becomes more careful of his words and actions and more keenly alive to the demands of justice. Still he is the same man that he was before election, and if then susceptible to improper influences, is in danger of yielding to like influences after his elevation. There is, however, not only in the incumbent, but in the community, a high regard for the judicial office; and in the selection of judges there is always a looking to the character of the man, almost, as one might say, an instinct, which chooses an honorable lawyer for the place.

It must also be remembered that a high-minded man on his elevation to office, even a judicial office, does not change his previously settled political convictions. If he has been a Republican before his elevation he has been one because he believed in the principles of that party, and he will naturally remain true to those principles. He does not on account of office wipe out all previous beliefs, and make his mind as it were a sort of *tabula rasa*. So it is not strange, but, on the other hand, is to be expected, that if a political question is presented, his prior convictions will largely influence his decision. I remember hearing Colonel Ingersoll deliver, after the decision of the Hayes Commission, his famous address upon "8 to 7," in which he started out in a humorous way by asesrting it to be capable of mathematical demonstration that 8 beats 7, and in the course of which he said that he himself had never doubted Justice Bradley's vote because the Justice had married a daughter of Chief Justice Hornblower, of New Jersey, who was so rabid a Whig that he was credited with having said that he believed all Democrats should be hung. But political

questions are seldom presented for judicial decision. On the contrary, if a controversy is purely political, courts are wont to declare it outside of their jurisdiction. Sometimes, however, private disputes involve the consideration of questions of a political nature, and then the early convictions of the judge on party issues may not unreasonably be expected to affect to some degree at least his decision.

There are two things which tend to minimize the possible effect of all outside influence, including therein the influence of corporate wealth and power. One is the indisposition of the American people to transfer one from judicial to political life. It is encouraging that this disposition is growing. I firmly believe in its wisdom, and should not regret even constitutional amendments forbidding any such transfer. I know there have been conspicuous instances in the past, and may be in the future, in which the selection of a judge for political life was wise, justified by the character and fitness of the man; but, as a general rule, one accepting judicial office should be impressed with the conviction that thereby his political life is ended and that the possibility of distinction and success lies wholly in his devotion to judicial service and the character of the work he does therein. Over the judicial door should be written in fadeless letters: Who enters here leaves all political hopes behind.

The second is the permanence of judicial life. We have in this country a wide variation in the rule of tenure, from that of two-year terms for some State trial judges up to the life tenure of Federal and some State judges. Even in States where the life tenure is not granted the disposition has been to increase the length of the judicial term. In New York Justices of its highest court hold for fourteen years, and in Pennsylvania for twenty-one years. There are some who consider this long tenure of judicial office as against public welfare, a sort of anachronism in republican institutions; but the surest guaranty of the permanency of republican institutions is the stability, the long tenure of judicial office. Carlyle stigmatized democracy as "shooting Niagara," regarding the passionate and hasty movements of an excited populace as sure to some time wreck established government. That which stands in the way of such a possibility, that which prevents democracy from "shooting Niagara," is the conservative influence of a stable judiciary. A legislature which reflects the popular will may be called into being at comparatively short intervals in order to express that will in statutes. But an independent judiciary holds all legislation within the fixed boundaries of constitutional amendment and prevents the hasty wrath of the people from doing themselves as well as the Government an injury. It does not prevent the popular will from being carried into effect. It only stays its action. It may be well that the wheels of a wagon or car be greased so that they may move more easily, but a wagon or car without brakes is in danger of speeding on to destruction.

It is a grievous mistake to suppose that judges are placed in office to execute the popular will. I remember that when as a Circuit Judge my convictions of constitutional limitations compelled me to decide against the wishes of some ardent Prohibitionists of my own State, Kansas, a convention of those Prohibitionists passed a resolution demanding an amendment of the National Constitution to provide for the election of judges for only the term of a single year in order that they might not stand in the way of the popular will. But the very purpose of the judicial office is, not to reflect the passing and changing thought of the populace, but to determine rights upon immutable principles of justice—principles which have passed by deliberate judgment into organic and permanent law.

Coming closer to the specific question, it is urged that corporations by their wealth and power are potent in conventions and with executives, and thus have large, if not controlling, influence in the nomination or appointment of judges; that naturally they will seek to put in judicial position those friendly, and that thus gradually they will secure a dominance over judicial decisions, making them in harmony with their interests. It is well to look a matter like this squarely in the face and consider both the possibilities and dangers. It will be perceived that the question does not imply the gross form of pecuniary corruption, but only

the insidious influence of accumulated wealth and power. It is useless to try to laugh the suggestion down as tho it were outside the range of possibilities. But is there good foundation for the suspicion?

The considerations already noticed are against it. They tend to place judges beyond the range of outside influence. Let me also notice other matters which may relieve the fears of many. Corporations generally complain that the administration of the law in the courts is unfavorable to them. There is, in fact, whether well or ill founded, a popular prejudice against corporations, and that prejudice finds expression in the verdicts of juries, which, in doubtful matters, usually favor the individual and punish the corporation. But so far as the individual and the corporation have conflicting interests, the administration of the law cannot favor each. If one is favored the other is injured. When each complains, may it not well be because there is in fact no favoritism?

Again, there is significance in the general demand for judicial honesty. While every failure of official duty offends, a failure by a judge is specially odious. No one likes to be condemned at the bar of public opinion, and least of all of that which it pronounces a heinous offense. Few covet infamy or even social ostracism, and a guilty judge is a social outlaw. The restraint of public sentiment is, therefore, a potent factor. Helpful to this is the greater publicity which now attends all official action. The press with its myriad eyes is watching every minute action, and anything which a judge may do in disregard of official duty or even in such a way as to create a suspicion of his integrity is seen and published throughout the land. He acts as never before in the full light of day, and, conscious of that, guards well his own actions.

Further, managers of corporations share in the general feeling. They are, as other men, citizens, patriots; and as citizens and patriots abhor anything like national disgrace. They are not consciously public enemies, not robber barons standing at the highways of commerce with intent to plunder every passing traveler. Their ideas of what is for the public weal may differ from those of others, but they are not Neros, ready to fiddle while Rome burns. All their interests are in the well being of the Republic, so that they, with all others, have that general longing for judicial honesty.

More than that, their interests demand it. It is a mistake to suppose that litigation is principally between individuals on the one side and corporations on the other. The great bulk of important litigation is between different corporations whose business interests or plans collide. Common sense tells their managers that they need for the settlement of their disputes the most capable and honest judges. They cannot foresee the disputes which may arise. Their safety lies in the ability and integrity of the judges, and their pecuniary interests, therefore, as well as their feelings as citizens and patriots, impel them to do what they can to place men of integrity in judicial office.

Still further, their wealth enables them to secure and the importance of their business interests requires the highest legal talent in their counsel. It is proverbial that the best lawyers are in the employ of corporations. But the great lawyer is an honest man. The old idea that trickery and deception were the weapons of the profession and that the more damnable the character the better the lawyer has passed away, and all realize that integrity is as essential to success as a lawyer as to success in any other profession or business. So if it be true, and to the extent that it is true, that corporations are instrumental in putting their counsel in judicial office, they are simply placing there men of the highest character. And such a man placed in such an office feels as keenly, if not more so than others, the obligations of justice. Indeed, the very fact that prior to his elevation he has been in the employ of corporations tends to make him careful lest any decision should be a departure from strict law in any way favorable to corporations. To use a common illustration, he is so anxious to stand up straight that he not infrequently falls over backward.

Let me narrate an incident which illustrates this. My predecessor in the office of judge of the First District Court of the State of Kansas, Hon. William C. McDowell, was a gentleman of the highest character. His most intimate friend was Hon. Samuel A. Stinson, at one time

Attorney-General, and perhaps the most brilliant man who ever came to the State. Their friendship was known to all, and after his elevation to the judicial office Judge McDowell was so apprehensive that his friendship might mislead him that he was continually deciding doubtful questions against Mr. Stinson. At the close of his judicial life the Bar of the District, who loved and were proud of Judge McDowell, prepared a suitable token of respect, and delegated Mr. Stinson to make the presentation speech. He humorously referred to the difficulties he had had by reason of the fact of the well-known friendship of the judge to himself, saying, "so persistently, your honor, have you decided against me that I feel sure that if I had filed the Ten Commandments as a declaration and subpœnaed the twelve apostles as witnesses you would have found some way to beat me."

But, after all, the surest guaranty is the growing earnestness of the demand for highest integrity in all official life. No one can compare generation with generation without being conscious of a wonderful improvement. A few centuries ago a judicial decision meant favoritism. Still later it meant corruption, and the great Lord Bacon could only plead the custom of the times in extenuation of his misconduct. All that has passed away, and now judicial corruption is a thing almost unknown. Nor is official integrity confined to judicial life. How very rare are the instances of failure? Think for one moment of the hundreds of thousands in the employ of this Government and only here and there does one prove false to his trust. We hear through the papers of every such instance and are sometimes alarmed thereby, but we seldom think of the hundreds of thousands of those who are true and of whom no mention is made. More and more is integrity in official life the rule. And it is the rule because of the increasing integrity in personal life. Officials will never be better than the people for whom they act, and as personal integrity prevails, so more and more will it become the characteristic of all official, and especially of all judicial, life. Not far off is the day when every judge in the land, from the highest to the lowest, will in his official administration realize to the fullest extent in letter and spirit the obligation which every Federal judge assumes by his oath, that "I will administer justice without respect to persons, and do equal justice to the poor and to the rich, and that I will faithfully and impartially discharge and perform all the duties incumbent on me as judge, according to the best of my abilities and understanding, agreeably to the Constitution and laws of the United States; so help me, God."

WASHINGTON, D C.

Backgrounds

BY W. H. WOODS

"THE play, the play's the thing!" Lord Hamlet, no.
The peopled and illimitable night
Hath mightier ghosts than Denmark's, and the light
That limns the upturned face of Romeo
Paints half a world of faces in its glow;
Arden hath untold lovers hid from sight
To Rosalind, and many a willing sprite
Unknown, unsummoned, waits on Prospero.
What else is watching in the dark behind?
Who knows when legions, angel, ghost, or djinn,
Shall break from out the backgrounds vast that bind
Our cramped horizon, and o'errun the scene,
Or God himself crash on us mummers blind,
And play be done, and life, life, life, begin!

BALTIMORE, MD.

The People at the Fair

BY MRS. L. H. HARRIS

[This is the second of the three articles by Mrs. Harris, whom we have sent to the Fair to give our readers the benefit of her impressions of the sights and sightseers.—EDITOR.]

WE are naïvely, youthfully self-conscious in this country, and we have a sort of universal "fraternity yell" for proclaiming the fact. We "spiel" involuntarily for the same reason that a sophomore "roots" at a football game, because we are young and healthy. And Mr. Walter Page struck the American keynote recently in the following peroration about the people at the World's Fair:

"The Fair is not the main thing. It's the American people! We are great—we of this vast valley. Here we are, with our wives and children. We wear good clothes. The jayhawkers and blue jeans chaps are not any longer among us. We are clean shaven—no clodhoppers, we. . . . Nothing whatever 'phases' us. . . . We say to ourselves, 'We can do anything.' . . . The world is ours. . . . WE ARE IT."

To be sure we are "It." The only evidence to the contrary is our vernacular and the provincial way we have of proclaiming ourselves. But Mr. Page has anticipated our "Itness" at the World's Fair. The great intelligent, sober minded body of the American people have not arrived yet. He mistook our vacation legs and appetites for "Us." Two-thirds of the "clean shaven" men, short skirted women he calls the "great American people" are natives of St. Louis, at least of Missouri, come for a day's outing. This is why they brought the "kids" Mr. Page refers to so appreciatively. And, of course, they talk and ride the spinning jennies together, because they are neighbors. These are their urban earmarks. People who live in cities, work in stores, factories and breweries do not thirst so much for information as they do for amusements. When the "jayhawkers" from the villages, the "clodhoppers" from the country, the millmen from the East, the club women from the North, the "F. F. V.'s" from Virginia, and the rich prodigal sons from the West reach the Fair, the greater American people will have arrived. Then we shall learn what a magnificent achievement the Fair really is. At present those in attendance are not sufficiently interested to interpret its more serious aspects.

Still the crowd seen on the grounds really is one of the interesting features of the Fair. It flows in like a tide, twice daily, ebbs once, between 9 and 11 o'clock at night; and is seen in all its moods and moodiness on the Plaza St. Louis during the forenoon. It is usually flanked by a visiting military company, always punctuated by the blue-uniformed Jefferson Guards and continually harassed by red-coated pedlars ready to sell anything from an "official guide book" to a bracelet or a bag of sweetened popcorn. As a whole, it has no sense of things, no motive. The herd instinct seems to dominate, and it continues to thicken and whirl until the music begins in the band pavilion. Under this recalling influence the individual recovers his personal consciousness, little groups detach, and presently the mass has become spider-legged, reaching in all directions. During these early hours the students with their roller-chairs see an easy and unprofitable time; for the fat lady, who is the first to succumb, does not discover before noon that she cannot walk to and from her State building to any part of the grounds without fatigue. But once she abandons herself to the idea of helplessness, she becomes as inert and consciousless as a bale of cotton, and will require a pathetically thin-legged student of the Wisconsin University to push her from the fore end of the Pike up the noble but exhausting hill to Festival Hall without a blush, because she has paid him twenty-five cents to do it. This is business, but the last flight of steps taken

afoot would better illustrate the tenderness for which the feminine heart is noted. The corpulent gentleman is equally heavy in his demands, and is one of the most ludicrously amorphous looking spectacles to be seen on the grounds.

Many are conscientiously bent upon seeing the Exposition proper, but, as has already been intimated, the majority are seeking diversion. The Pike is uninteresting until evening, being in a sort of coma from the previous night's exertions; but at any hour of the day, when less than a hundred people are in many of the great exhibit buildings there will be five thousand in the Boer War Concession, watching a mimic battle between the English and Boer armies. That is to say, the particular class of people visiting the Fair at this time are not qualified by taste or intelligence to appreciate the magnificent display of arts, industries or invention, or they are curiously indifferent to their opportunities. And much evidence supports the latter conclusion. Even the most refined-looking element gives the impression of having brought nothing more enterprising than a vacation impulse to "have a good time."

Meanwhile the country woman, who sold butter and eggs to pay for her ticket, is seated before some painting in the Fine Arts exhibit wondering if she is looking at a masterpiece or a daub. And the elderly maiden lady delegate from some progressive female club is wearing herself out in the Government Reservation studying the naked Igorrotes. (More women than men visit this concession, and the writer saw a number of them take part in the wild dance and hound song of these dog-eating savages.) This perversity of interest is characteristic of the crowd. And not all of it is as pathetically vicarious as that of the mother who spent a week in the Electricity Building because her son is an electric engineer. "He can't leave his job, an' I'm gittin' an idea of things in here so as I kin tell him about 'em when I go home," she explained. Preachers, deacons and their attendant staff of church members are always seen collectively in the Agricultural Building, and separately on the Pike. This is not an evidence of secret depravity, but of the fact that they prudently distrust one another's judgmental dogmatism.

The people who visit the Fine Arts Buildings are of all grades and types. But the greater number are ill at ease, like strangers in a foreign country, and afraid to express an opinion. The person who really understands the ethics and values of art is so fitted to the situation in consciousness that he is not easily recognized. But the person without the remotest conception of form and color as an art is the one who really enjoys himself. He knows what pleases his fancy and is ingeniously ready to proclaim it. And what is worth noting is the fact that he frequently congregates before the right picture.

In the Anthropology Building alone is the expected class of teachers, students and antiquaries found. And this is the only place in the Fair proper where the people are genial and communicative.

Among other exhibits, however attractive, men and women stand side by side half a day without exchanging comments. But here every one joins in the conversational *mêlée,* from the school teacher bent upon acquiring biological scandal concerning the primitive races to the old grey-beards wrangling over the pedigree of Aztec relics. The cause of this cheerful animation is two-fold. First, there is the subconscious elation all feel over the evidence that they have advanced in the scale of things. Each person realizes the complimentary difference between the convolutions of his cranium and the small gourd-shaped skulls of his remote ancestors on exhibition. Second, they feel in the presence of these low-grade bones and relics that they are all descended from the same Adam-ape race. This is a very leveling sensation, and the victims instinctively recognize a common relationship which they would deny in, say, the Educational Department.

On the Pike at night the crowd amalgamates, absorbs feverish elements and becomes eccentric. But it is alway wary, hard to take in by the "spielers'" blandishments, and the great majority never enter a "concession." Yet the soberest citizen wears a "don't care if I do!" air that is highly diverting. He finds the very proximity of dancing girls, and the Pike atmosphere generally, exhilarating. No sensible person will attempt to explain this phenomenon, but the fact is

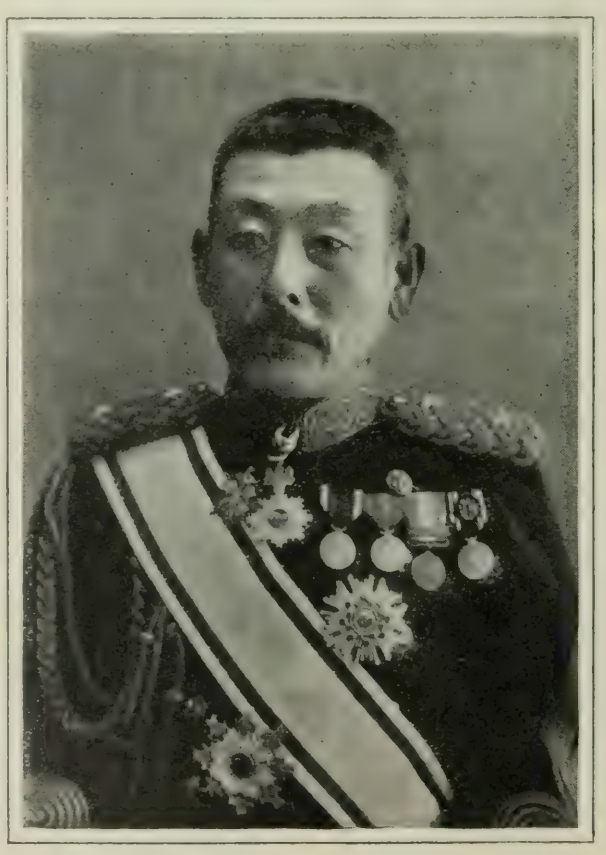
older than David that the best of men find pleasure in vaudeville exhibitions of femininity, and saints are often unaccountably animated by the worldly life about them. And every good, conscientious man who goes on the Pike knows he is innocently liable to see a dancer before the entrance of almost any theater. His counterpart is the respectable middle-aged lady, who is always seen in the crowd on the Pike resisting the stimulating influences about her with a virtuous energy that is morbid. Her presence is no more puzzling than the good man's is. She has cultivated her moral faculties until she enjoys "resisting temptation" as she could not enjoy the most innocent amusement in the world. But her godly mistrust of her own carnal nature makes her a rock of offense to the "spieler," for the tides of his eloquence dash against her in vain. She stands on the rim of the crowd and looks sorry for him, for the people who buy tickets and for everything she sees in that gay bedlam of noise, legs and wit. And every day she goes back and stays sorry until she is too tired to enjoy the difference between herself and the wicked.

The throng is made up, indeed, of many distinct types and they all show their individuality as the day wears on. The native of St. Louis predominates. He is recognized by his proprietary air and by his cordiality. He quickens with the host instinct, he is full of information and the disposition to impart it. He speaks all the visitors' languages and two or three of his own; and he is the tutelary deity of the beer gardens and the Pike. The grumbler is the meanest man at the Fair; and where two or three people are gathered together there will he be found. His symptoms are a dissatisfied mind and a limited power of appreciation. Nothing is as good as he expected to see, and he is outraged because the managers have not provided free transportation with electric fans attached. He thinks the pictures are poor, that the Government exhibits are misleading; he is disappointed in the size of California beets, and he is ashamed of his own State building. On the whole, he wishes he had not come, and so does every one else who has suffered the affliction of his company. The country man is known by his disposition to go in the wrong direction, and by his timidity. He is bold enough to draw near and stare at the legend on the cap of a Jefferson Guard, but he will not ask for information. He can get lost on the Plaza St. Louis, and he has been known to climb the wire fence about the Fair ground, because he could not find the "Main Entrance." But the most conspicuous man at the Fair is the "delegate," religious, social, educational or political. Every crowd is badge-speckled with him. And of them all the political delegate is the best man. He is more religious in his opinions than the Christian Endeavor delegate, and he knows more about social reforms than the club woman. In the Agricultural Building he shows the earth wisdom of a born farmer, in the educational exhibits he gives a tax-gathering father's advice to any who will listen. He is at home in the streets of Jerusalem, and in the bosom of the Pike. He knows more than anybody else does, no matter how much they know, and he feels more than they possibly can on any subject. He is a sort of universal "spieler." One other type must not be overlooked—the hermit visitor. He comes through the gates alone in the morning, skirts around the crowd in the Plaza, and disappears. At intervals during the day he is seen skulking from one building to another, with the air of a man bent upon getting private information and keeping it. He may be observed high among the peaks of the Cliff Dwellers' village, but he eschews the Pike proper. Where he comes from and where he goes is a mystery. But there can be no doubt about his being a born smuggler who considers information a sort of contraband of civilization, to be got as secretly as possible.

Leg fag is a disease developed by the people at the Fair. Men and women who have toured Switzerland and climbed the Matterhorn are exhausted by a day's tramping on the grounds. One reason for this is the prevailing optical greed and insatiable curiosity. Comfortable places are provided for rest and refreshment, but many do not avail themselves of these opportunities until they are exhausted. And few of them remain long

enough in one building or at a single point of view to carry away a right impression of what they see.

Almost no negroes are seen at the Fair. The writer saw but nine during seven days spent on the grounds and in the exhibit buildings. They claim that as laborers and otherwise the managers discriminated against them, and this may account for their absence. It is reported that Booker Washington and his wife were "turned down" by every first-class restaurant on the grounds recently, and that Mrs. Washington retaliated by persuading a large and influential body of negro women to hold their convention on the outside, thus avoiding gate fees and insults.



NASHVILLE, TENN.

Some Japanese Warriors

BY J. H. DE FOREST, D.D.

SPECIAL CORRESPONDENT OF THE INDEPENDENT IN JAPAN

AFTER Japan's first naval victories the question was widely raised: Will the army be able to meet successfully the soldiers of Russia? There was a half suspicion that the initial victories on sea were the result of the unpreparedness of the enemy, especially as Russia at once indignantly called it a treacherous attack. Then came long weeks while the Japanese army was marching north through Korean snows, and the Russians were pushing south into Korea, the game being which would reach Pyong-yang first. The Russians had both banks of the Yalu and every apparent advantage, yet their advance was steadily driven back and completely out of Korea, so that at last the two armies confronted each other with the Yalu between them. But the Russians had one of the strongest possible positions, their whole line commanding the Yalu River, and that renowned stronghold, Kurenjo, flanked by protecting hills, being their center. To cross the river in the face of that line of splendid defense, or to flank the enemy, was a fearful job to undertake, but even after crossing those various rivers, large and small, to storm those hills that bristled with cannon seemed a sheer impossibility even to some of the men who knew. General Myoshi, who helped take that same fort, Kurenjo, ten years ago, when the Chinese held it, was astonished to hear of its capture last May. He said: "When I stood on those hights and saw what a powerful position it was, I said no force under heavens could take it if decently defended, and yet our troops have done it in a few hours, certainly by the favor of heaven."

GENERAL K. NISHI,
Commander Second Division First Army

Yet the Japanese generals knew how to win the favor of heaven. They knew every inch of ground, and they knew every weak point of their enemy. Two of the victorious generals are from the Sendai camp, and when they left for the

Mrs. Nishi as She Appeared at the Emperor's Twenty-fifth Wedding Anniversary

front the city gave them a farewell meeting. Lieutenant-General Nishi was presented with a sword, and his brief soldier-like reply reminded me of Grant: "We shall bring safety and peace to Japan."

Born in a Samurai family of Satsuma, he early showed that love for literature and military accomplishments that distinguish the Samurai. When only eleven he was assigned a place in the household of the great Daimyo, Shimazu Saburo. Foreseeing troublous times for Japan he entered the army at twenty-one, and took part in the famous battle near Kyoto at the time of the Restoration. A little later, when the Aizu clan of the North defied the new Imperial forces, he led a band of 114 men in the rear of the Aizu castle and fought with swords until more than half of them were dead on the field. Then when the great Saigo fell out with the great Okubo and withdrew to Satsuma and organized his formidable rebellion in 1877, Nishi, like others, felt a profound sadness over the duty of fighting one who had been his beloved teacher in the arts of war. He rose to prominence from that time, and was made Major-General in 1889. His breast began to glisten with those Imperial tokens so precious to a Japanese soldier. In the Chinese war, he went victoriously through the length of Korea and down the Liaotang peninsula until his march ended in the five hours' bloody struggle at the downfall of Port Arthur. For this he was rewarded with the title of Baron, the Order of the Golden Kite, a pension of 700 yen, and later was promoted to be Lieutenant-General. He was in command of Wei-hai-wei until it was passed over to the British, "to be held as long as Russia holds Port Ar-

General Nishi's Daughter

thur." He is fighting under General Kuroki now, and for the recent victory at Kurenjo he has been promoted to the rank of full General.

Mrs. Nishi, born in the Shogun's Court and inheriting the Samurai spirit, is a fit partner for the General. With the modesty of all these fine women, you may question her in vain about her husband's conspicuous career. While just pride of her husband's deeds is in her face, she skillfully avoids every attempt to draw out any mention of those deeds. She is, however, not unwilling, when you press for some records of his life, to bring out the books that tell the story.

MAJOR-GENERAL MATSUNAGA

MRS. MATSUNAGA

If you insist on talking about her family, she smiles as she mentions the astonishing number of children she has, eleven, and one of her girls is the wife of a captain at the front.

When Nishi was fighting Saigo, his young friend, Matsunaga, had a band of men in the same camp. He has a jolly fact that conceals a serious heart, a fat wrestler's form, and all the pluck and skill of a true Samurai. In one of the battles against Saigo he rushed ahead of orders and got close in with one of the rebel leaders, from whom he received a savage sword slash on his head. His enemy then fled. Thereupon Matsunaga, with a towel hastily tied around his head, followed, shouting: "Coward, coward, turn and fight!" He actually caught up with and slew his enemy, at which General Nogi galloped up with "Bravo! Bravo!"

After that sad civil war, Matsunaga's breast began to shine with royal tokens. He was made Colonel and placed on the Staff of the Imperial Guards. He went with Nishi to the Chinese war and led his men in that bloody battle at Niuchwang, when the snow was knee deep. It took him but thirty minutes to capture the enemy's position. Before the fight he did an act that is full of profound significance to Japanese soldiers. He carefully bathed, saying that in case he should never return he wished his enemies should find his corpse ready for burial.

General Matsunaga is popular in the army, and he is also a lovable man in his family. He has a wrestling court in his yard, where he and his boys, who adore him, tackle each other in grim earnest. When he was leaving Sendai, amid crowds of people shouting "Banzai," an American lady ventured to decorate him just above his medals with a tiny American flag. He wore it to Tokyo, where he was met by the high and mighty of

Y. FUKUSHIMA

the land, one of whom said: "What in the world have you got that flag on there for?" "That was presented me by an American lady in Sendai," was his smiling reply. And that little flag, rich with its new meaning of United States sympathy, gave real satisfaction to his military friends.

Mrs. Matsunaga, busy as she is with her large family of four boys and two girls, does not forget the soldiers. She is under training to become a regular nurse. Mrs. Nishi and she are always seen among the crowds that meet the 4.20 morning trains that are bringing home the sick and wounded from the Yalu River battles. The memories of twenty-seven of these Sendai soldiers who fell in conspicuous deeds of bravery have been honored by the Emperor with orders of the Rising Sun, which will be precious heirlooms in the homes of their descendants.

Not long ago at a reception in the United States Legation, where some of the chief military and naval men of the Empire were present, I met the famous Major General Fukushima, who kindly sent me his photograph and a copy of his adventures, 430 pp. What made this man famous was his solitary passage on horseback through Siberia in the winter of 1893. The Russian officials were eager to assist him, and would have kept him to the usual routes, but he declined all aid, and went where men are not accustomed to go, running his chances with robbers and terrible storms and dangerous cold. There are no people more gifted in the power of observation and quicker to see through things than the Japanese. And there is no Japanese who has done Asia with such credit to Japan as the then Lieutenant-Colonel Fukushima. During his one and a half years of travel he went 9,000 miles, of which that horseback ride through Siberia capped the climax and made him a glorious hero all through Japan. The people gathered in crowds to welcome him as soon as he touched foot on his native soil, and when he reached the capital, the Emperor graciously received him and covered his bosom with brilliant insignia. He has become Major-General

REAR-ADMIRAL M. SAITO.
Vice-Minister of Marine

and is now Chief of Staff in Tokyo—one of those strategists that are moving the three armies of Japan in their victorious movements against the constantly defeated Russians.

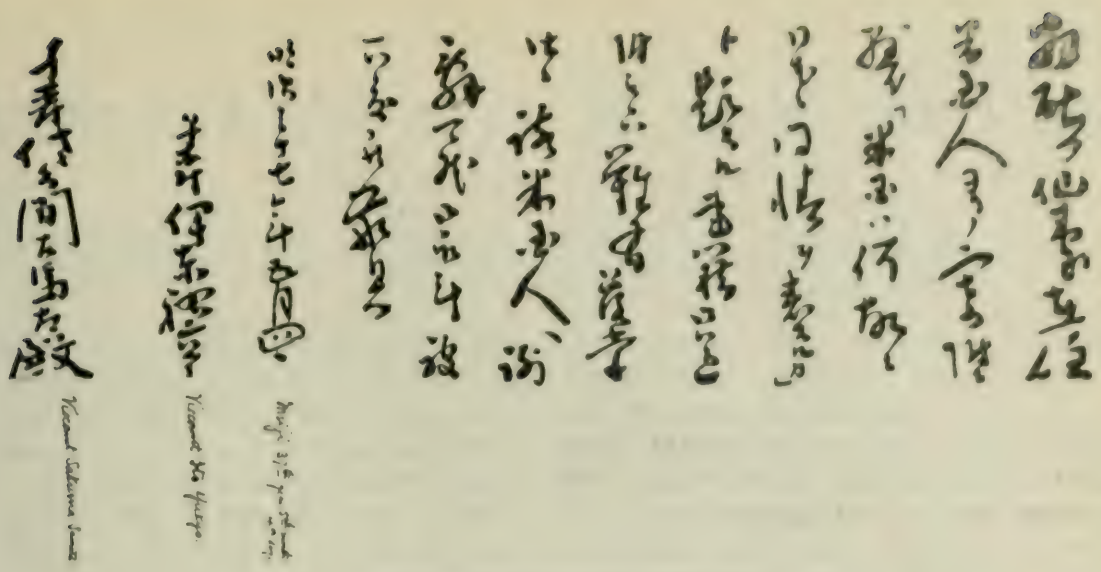
Fukushima was with the allied armies in the Pekin rescue, where the Japanese troops impressed all the Western forces with their exceptional discipline, their superb self-control, and daring successes. And what is not so much considered, those Japanese soldiers made minute observations of the allies, and from that day they knew they had nothing to fear from meeting any of them in deadly conflict.

No one man has educated the people into belief of the vulnerable condition of Russia as Fukushima has. On the breaking out of hostilities his battle song was sung everywhere. The short, stocky soldier smiled in a depreciating manner when the translation of his poem into English was referred to. It taught the people as only a popular one sided poem can the savage characteristics of the enemy. Miss C. B. De Forest's translation is an accurate reproduction of the original:

Hail the Rising Sun, the emblem
Of our world renowned Japan!
In the morning rays her banner
Gleams across her kingdom's span.
Great her people—love of justice
And of fellow men inbred,
With a brave and loyal service
To her great Imperial Head.

Lo, our foe a land that knows not
Truth and righteousness by name;
Lies and treachery its usage,
Plunder and rapine the same.
Guiltless babes and maidens murdered.
Burning homes that rise no more,
Witness to the Slav, whose practice
Gods and men alike abhor.

Up and forward, steeds and warriors!
March! Already spring is here.
Righteous war admits no foeman;
Joy is ours with naught to fear.
Break the ramparts of Port Arthur,
Tear the walls of Harbin down!
On the hights of Ural mountains
Float the Banner of the Sun!



Drive the Slav unto the forests;
Let him hide within their shade.
Ancient Moscow be his refuge
There his bloody hand be stayed.
Then unto our Sovereign's glory
Praises sound and never cease,
While our hearts unite, rejoicing
In a great and world-wide peace.

ADMIRAL VISCOUNT Y. ITO,
Chief of Naval General Staff

Admiral Viscount Y. Ito, as everybody knows, is the Chief of the Naval General Staff. He it was who defeated the Chinese fleet and drove it into Wei-hai-wei. Then he wrote Admiral Ting, as an old and admiring friend, to surrender, which was done, but the unfortunate Admiral committed suicide. Here came in Ito's chivalry in that he, without consulting his superiors, returned one of the battle ships, in order to carry Admiral Ting's corpse in a fitting manner to Tientsin. The Emperor of Japan not only did not censure him for this, but rewarded him in addition to the usual high insignia with a gold watch.

It may interest the readers of THE INDEPENDENT to see the Admiral's handwriting and signature in a letter to General Sakuma, that has been given me, simply asking the General to thank a certain American for his sympathy for Japan. General S. Sakuma's name is at

Autograph Letter of Admiral Ito

the extreme left of the letter, and a trifle lower in the next line is, according to Japanese custom, the writer's title and name—Viscount Ito Yukyo.

The warriors of Japan come largely from the Sat-Cho region in the southwest. Comparatively few hail from the north, and of these the one who has reached the highest pinacle is Rear-Admiral M. Saito, for the last five years Vice-Minister of the Navy. He will be well remembered in Washington, where, as Lieutenant, he was naval *attaché* to the Japanese Legation in the days of Presidents Arthur and Cleveland. Successful in every position, and winning the warmest confidence of his superiors, on his return he was rapidly promoted and honored with appointments that placed him close to the person of the Emperor. Medals from both England and France have been conferred on him. He naturally was the one to take to the palace the glad news of Admiral Togo's victory at Port Arthur.

While briefly mentioning these prominent warriors it is impossible not to think of the lesser rank and file who are bearing the brunt of some of the most remarkable battles ever fought. In the Kurenjo charge there was Captain Makizawa leading his men with: "Let's all perish! Zemmetsu! Forward!" But he falls badly wounded, and hears his man say: "We must get him out of the battle line." At which he stands once more with lifted sword, shouting: "Fools! Forward!" and pushes on still in front until another bullet drops him never to rise again. They hear his last words of sadness: "Too bad! Not to see it through!" and leaving the body of their dear leader they are on again to victory.

Trains come every two or three days now with carloads of sick and wounded. Long rows of rough but comfortable hospitals are going up for these thousands and thousands yet to come. As the cars roll slowly into the city station, the high officials, the Red Cross nurses, the ambulance corps, wives of the military officers, headed by Mrs. Nishi and Mrs. Matsunaga, besides crowds of citizens and school boys, each with a small battle flag of Japan, meet them. Meet them in dead silence! "Why not shout glad Banzai to these victors," is a question I venture to ask. "It wouldn't do to get the boys too excited."

"While the Japanese is first of all a fighting man, a destroyer of men, the Russian is a born and bred husbandman, a keeper of men, having knowledge alone of the arts of peace." Thus writes a man in a recent American magazine. If he knew these warriors, the homes of the people here, and their history with a recent period of 280 years of peace, while Russia had about as many years of war, he would not have made that well balanced sentence above. There is no more peace loving nation anywhere than the Japanese.

SENDAI, JAPAN.

The First Year of Pius X's Pontificate

BY SALVATORE CORTESI

[A year ago last week Pius X assumed the Pontificate. The following article by our Rome correspondent sums up the year with the exception of the trouble with France, which concluded since the article was written.—Editor.]

NULLA *dies sine linea* begins to be said at the Vatican with regard to Pius X and his reforms, which have the object of perfecting and putting into good order all the vast and complicated ecclesiastical machinery. It is remarked that, generally speaking, Leo XIII was the Pope of great ideas, who traced new and broad ways for the Papacy, opening to it fresh horizons and vast fields, while Pius X cares for the details, perfects the mechanism, and looks to the exact accomplishment of their duties by the highest as well as the lowest members of the hierarchy.

The Catholic Church has been compared in these days to a gigantic engine, urged forward under Leo XIII for 25 years to a great speed, so that it now needs a general tightening of the many screws, which have gradually become loosened, in order to put the engine in a condition to continue its race with complete safety and all the probabilities of success. In other words, the present Pope—who is a sincere admirer of his predecessor, nothing annoying him so much as to be considered antagonistic to Leo—seems to intend to work chiefly with the object of securing the greatest possible advantage from the condition of the Church as it was left by the late Pontiff.

In what Pius X differs from other Popes is the determination with which he insists on having the reforms he establishes really carried out, without making distinction if those who have to obey are humble priests or occupy high positions in the ranks of the Church. Take, for example, the Canons of the different basilicas. They are most prominent among the clergy of the Eternal City, and formerly retained their lucrative appointments honorarily, being otherwise engaged in various often less ecclesiastical, but more profitable, employments. The Pope stopped all this at once with a *motu proprio* decreeing their daily attendance at divine service, insisting on the punctuality of each, forbidding substitutes, and emphasizing the necessity of a reverent attitude more fitted to their position and duties when in church. A prelate who under Leo XIII had obtained a dispensation to absent himself from the daily attendance in his basilica applied for a like favor to Pius X, which was refused. In a private audience later the Pope recommended assiduity in his duties as member of one of the congregations. The prelate replied, "But, Holy Father, I am also Canon of St. Peter's. What can I do? The service takes up almost the whole morning, I cannot be in two places at once, and Your Holiness has not deigned to concede me a dispensation." "The Canons," replied the Pope, severely, "must assist at the services. I will concede no dispensations on this point. For every service from which you are absent you must pay the fine."

However, to avoid a repetition of such incidents the Pope has decided henceforth never to appoint any one Canon who already occupies a lucrative office, which would prevent him from participating in the morning service. Likewise he has declared that he will no more tolerate that the Canons of St. John Lateran should use influence to be transferred from that chapter to that of St. Peter's, because of the higher prebend attached to the latter. "The Lateran," exclaimed Pius X, "is the Cathedral of the Pope, the first church in the world; so it is evident that the Canons who abandon it to pass to St. Peter's are only looking to worldly aggrandizement, which is repugnant in a servant of God."

In all these reforms, in that restoring the Gregorian chant, in religious teaching, etc., it is most remarkable to note how Pius X is consistently carrying out as Pope the ideas and principles which he

professed and advocated as Bishop and Patriarch. The reports he then sent to the Congregation of the Council, proposing and supporting changes which he is now introducing, would make very interesting reading. Among other things he then asked the abolition of fasting on Saturday, considering two days' abstinence too long a period, and as Pontiff he immediately issued the dispensation for the Universal Church. He also insisted on the necessity of reducing the number of feast days, which are too numerous and, he added, some very difficult to observe, they not being recognized by the civil authorities of the different countries; and as Pope he has set to work to decide which of them can be suppressed.

There is one undertaking of the present Pope which, if successful, will make the name of Sarto more famous than those of many of his predecessors, and he will leave one of the most important marks in the history of the Papacy. I refer to his initiative for the codification of ecclesiastic law, thus showing how he perceives with exactness the phenomenon of evolution of laws, as part of the development of society, his ambition being evidently to give to the ecclesiastic world what Justinian, in ancient times, and Napoleon, in modern days, gave to the civil world with their famous codes. The laws in use for the Church were almost all issued in the Middle Ages, when the Papacy exercised uncontrolled power and enjoyed privileges and prerogatives with the civil governments, one may say, of the world. Pius X un-

Pius X at Work with the Papal Secretary of State, Cardinal Merry del Val

derstands that these same laws are not adapted to the twentieth century in the countries where the Catholic Church is entirely separate from the State, as in England and the United States, as well as where between Church and State there is a special agreement, as in France and Portugal, or where Church and State are nominally enemies, but the State administers the patrimony for worship, and a *modus vivendi* practically exists between the two, as in Italy. The plan of the Pontiff must, therefore, mean not only the codification, but also the modernization, where possible, of canon law.

The best example of the modern ideas of the present Pope directly regards America, he having allowed Cardinal Satolli to visit the United States, which is an unprecedented step on the part of a member of the Sacred College, and a concession on the part of the Head of the Church of which there is no other example in history. Cardinals of Curia—viz., belonging to the Court of Rome—have hitherto never left the Eternal City except as Apostolic Legates, an office which dates back to the remotest centuries of the Christian era, and whose importance and authority were established by Gregory VII in the eleventh century, when he reminded kings, bishops and barons of the reverence due to these representatives of the Holy See, whose words, he said, were to be considered as coming from St. Peter himself, and that at their appearance all tribunals should cease functioning, the Legate alone having the right of first and final judgment. Gregory added that he considered the Legates the links of that immense chain which binds each kingdom and each Church to its Head, the Pontiff. Their faculties were later extended so that they were entitled to create Apostolic Protonotaries, Knights of the Golden Spur, Doctors of Divinity, etc. Geiza, King of Hungary, was coerced to obey the Apostolic Legate; Henry II of England, in 1168, went two leagues to meet the Legates sent by Alexander III, and escorted them to their palace; Henry IV, King of Castile, met, in 1473, Cardinal Borgia, afterward Pope Alexander VI, at the gates of Madrid and placed him on his right. The last Legate *a latere* sent by the Holy See to a foreign Government was Cardinal Giambattista Caprara, who went to Paris in 1801, charged by Pius VII to oversee the carrying out of the Concordat, and he remained in the same position under Emperor Napoleon I.

What a difference with Cardinal Satolli, who, to use his own words, "without a mission of any kind went to the United States as a friend to visit old friends." Contact with the American people and ideas has made Cardinal Satolli one of the most conspicuous figures in the Sacred College. He may be compared to a breath of modern life and enlightened progress, which the Pope highly appreciates.

Only one branch of Pius X's duties is not yet quite clear and settled: what his attitude will really be with regard to politics in Italy, France and other Catholic countries. It was supposed that his election was especially due to the desire in the majority of the Sacred College to replace a Pontiff who had been chiefly political by one who would interest himself little or not at all in politics. In his first allocution Pius X said that his program would be to "restore all things in Christ," but he added immediately after that as Christ is the Truth, his first duty would be to proclaim the truth; and, therefore, to defend truth and the Christian law, he would have to speak clearly upon certain matters and recall men to the right road in private and public life, in social as well as political questions. It was thought that the claims for the restoration of the Temporal Power would be almost abandoned, while in the same allocution he proclaimed that, "since it is necessary and of the highest interest to the Christian Commonwealth that the Sovereign Pontiff should, in his government of the Church, be not only free, but seem to be free, and under the influence of no Power whatsoever, therefore, in accordance with the demand placed upon us by holy religion, by the consciousness of our charge as well as the oath by which we are bound, we complain that in this matter the very gravest injury has been done to the Church." This, however, might have been considered as the necessity of continuing the tradition of the Papacy, if the visit of President Loubet to Rome had not offered Pius X the opportunity of issuing

one of the strongest protests since 1870 against the occupation of Rome. Nevertheless, four weeks after he allowed Cardinal Svampa, in his quality of Archbishop of Bologna, the chief town of the ex-Pontifical States after Rome, to greet King Victor Emanuel there, and sit at his board. When Patriarch of Venice he had been most energetic in organizing the clerical forces, making alliances with the Conservative elements, working together with Deputy Count Macola (who killed the Radical leader, Cavallotti, in a duel) to defeat the Liberals and anti-Clericals. It was, therefore, hoped that under his Pontificate the *non expedit* for Catholics to join in the political arena would be removed. Instead, one of his first *motu proprios*, that on Christian Democracy, established that they must have nothing to do with politics and never be made to serve political ends or parties, and must abstain from participating in any political action, this being under present circumstances forbidden to every Catholic *for reasons of the highest order.*

I have heard it irreverently said that the Pontiff Pius X seems to be continually scolding the Patriarch Sarto for what he did in politics, but a more natural explanation of the apparent contradiction is that a Pope should not be judged when his Pontificate has not yet lasted a year.

ROME, ITALY.

Topics and Talk in England

BY JUSTIN M'CARTHY

THE death of the famous man who was once President Kruger is the subject which just now chiefly occupies public attention in England. Kruger died a peaceful death in that loveliest of regions, Clarens—"sweet Clarens," as Byron calls it, near Vevey, in Switzerland—a peaceful death-scene for one who had gone through so much struggle in life. Kruger's will assuredly be regarded as one of the most peculiar and in its way picturesque figures in modern history. He was for many years the object of unmeasured hatred and also contempt on the part of a large proportion of the English people, who could see in him only a wicked enemy, an unscrupulous assailant of England's just rights, a corrupt politician, and at the same time a very ridiculous personage. As time passed on and we got farther and farther from the war, and as it began to be seen that the difficulties of England's position in South Africa were not all created by the personal action of Kruger, public opinion began to grow somewhat modified toward him, and now, perhaps, while his remains are still unburied, his career may be criticised even here in a fair spirit.

It is only just to say that there were always many influential Englishmen in political life and out of it who could render justice to the career of Kruger even when he was England's uncompromising enemy and who refused to see in him merely a sort of grotesque embodiment of all evil. But certainly during my recollection I do not think that any chief of a foreign state at war with England was ever regarded in this country with more general dislike than was poor Kruger—brave, sincere, fanatical, no doubt, fantastic in many ways, seeming sometimes like a sort of burlesque of Abraham Lincoln, but always devoted heart and soul to the cause of his country.

I met Kruger once and only once. He visited London not long before the final war and while negotiations were still going on for an arrangement of some kind, and then I met him at a public dinner, which was not given in his honor, but to which he was invited among many other guests. I was introduced to him on that occasion, but our conversation was somewhat limited in its nature, inasmuch as he could not speak any English and my acquaintance with the Dutch of the Transvaal was decidedly limited. But I re-

PRESIDENT STEPHEN J. PAUL KRUGER

member I was pleasingly impressed by the quiet simplicity of his manner and there seemed to me to be in his face and in his voice the suggestion of a great reserved force of intelligence and of resolve. It is said that his dying wish was for a burial place in Pretoria. I am glad to hear that English officialism in South Africa will raise no objection to a compliance with this latest wish on the part of England's former enemy, now dead.

A subject of much debate just now is the proposed scheme for the reorganization of the Army which was introduced a day or two ago in the House of Commons by Mr. Arnold-Forster, the War Secretary. The scheme is sure to meet with fierce opposition, more especially in military circles, and is, I should think, destined to receive but languid support from the general public. Mr. Arnold-Forster has devoted much of his life to the study of military questions and of plans for Army reorganization. Yet he does not come of a very warlike, or, at all events, a very military stock, for he belongs to the family of which the late Matthew Arnold, the celebrated poet and critic, was a member, and he is the adopted son of the late W. E. Forster, who was for a long time an active and influential supporter of that peaceful Radicalism professed by Cobden and Bright, and was never supposed to have any military tendencies except, indeed, when, in his later unlucky efforts to govern Ireland as Chief Secretary to the Lord-Lieutenant, he was endowed by some of the Irish members with the odd nickname of "Buckshot Forster," because of the attempts made during his administration to suppress Irish opinion by the rifles of the police.

I shall not attempt to offer any definite opinion as to the merits of Mr. Arnold-Forster's scheme for Army reform, for the good reason that I have no practical acquaintance whatever with the details of such a subject and can only regard it from the point of view of an ignorant outer observer. But the scheme has at least one attractive quality for me, and that is found in the fact that it proposes to reduce in some degree the size of the Army, and while making it more effective for real emergencies, to make it less of a burden to the taxpayers and less of a menace to England's neighbors in Europe and elsewhere. I have always believed that the maintaining of a vast army is in every way harmful to the English people, not only because of the enormous taxation it involves, but also, and if possible even more, because of the constant temptation it holds out to the employment of the army in all manner of military enterprises abroad. I am strongly inclined to the belief that if we had an army, or the nucleus of an army, ample for defense but not defiance, well capable of protecting England against foreign assailants, but not large enough to stimulate the invasion and the acquisition of foreign territory, the result would be of immense advantage for the prosperity and the happiness of all the King's subjects. It will be a great time for England when her Governments make up their minds to consult first of all for the prosperity of the people who live in England, Ireland, Scotland and Wales, and not for the glory of adding new acquisitions of territory to the British Empire. Thus far, therefore, and thus far only, I am disposed at the outset to look with favorable consideration on Mr. Arnold-Forster's scheme. But I can assure the

readers of THE INDEPENDENT that I have not the faintest hope of finding my way of looking at the subject adopted by many of the critics to whom will come the task of debating the new measure in the House of Commons. I am not for "peace at any price," but I have still less inclination for war at any price.

Another subject which has been creating much talk of late in the political world is the scheme said to be entertained by the Government for the reduction of the Irish representation in the House of Commons. The impression appears to be that the Conservative administration will bring forward such a scheme next year in the event of the Conservative Government under Mr. Balfour enduring so long. The idea is that Ireland now has a larger proportion of representatives than the number of her population would warrant when that number is compared with the population of Great Britain. People who ought to know, as the phrase goes, are constantly telling me that such a scheme is in process of construction. For myself I strongly doubt whether a man of Mr. Balfour's intellect and education could ever favor such a project. The minimum of the representation of Ireland was arranged by the Act of Union, and in order to reduce it still further that part of the Act of Union must first be repealed, and I leave my readers to judge for themselves whether it would be possible to retain any part of the Act of Union if once the Government should initiate the task of repealing any of its provisions.

Then, again, while it is quite true that the population of Ireland has sadly fallen off during the last half century—fallen off as, I believe, no other civilized race has ever fallen off—it is beyond all possible dispute that the deplorable fact is one of the direct consequences of the Act of Union and the manner in which Ireland has been misgoverned and oppressed by the British Parliament at Westminster. I can hardly think it likely that any English Prime Minister could feel inclined just now to bring such a question up for public discussion. But let me say at the same time that I should not by any means feel disposed to regard with alarm or disfavor the introduction of such an administrative project. Only let the Conservative Government initiate the work of doing anything to interfere with the Act of Union and see if we Irishmen do not welcome the happy chance which such an experiment would give us! The Act of Union, I venture to think, would never survive the debate of that session. But I do not believe the present Government will give us the chance. Many of the Tories in and out of office have probably been put much out of humor by the united action with which the Irish Nationalist members under Mr. Redmond's powerful leadership have resisted all attempts to win them over or frighten them off, and these Tory members are no doubt extremely anxious to reduce by any possible means the numbers of that Irish Party. But there are some men of brains and foresight still in the Conservative Ministry, and I do not believe that these men will encourage the proposed dissection of the Act of Union.

The English public, however, cannot be said even at this critical time to be wholly absorbed in politics. There is some talk also about literature. Among the novels of the better order lately published much interest has been created by

MR ARNOLD-FOSTER,
War Secretary

the story which bears for its name "How Tyson Came Home." This is the work of Mr. William H. Rideing, a writer, I think, not altogether unknown to my readers in New York and Boston, and the book is published by Mr. John Lane. I have for many years counted myself among Mr. Rideing's personal friends and have met him often on this side of the Atlantic and the other. But I must say that I never knew he possessed so many of the best qualifications for the higher order of novel writing as are found in this remarkable story. It is a story of incident and character, of Western adventure and of English social life, and it shows itself from first to last at once brilliant and thoughtful, observant and imaginative, a faithful picture of everything it attempts to describe, and a keen anatomist of human emotion. I have heard many literary friends speak in the highest terms of this novel by an author who was previously unknown to them.

I shall not attempt to tell the story of the book and shall content myself with merely saying that it depicts for us through its earlier passages the life of a Californian gold-mine region, and in its farther chapters life in the society of London's West End. The book recalls to mind at one time the literary work of Bret Harte and at another the pictures of English social life which Thackeray gave to the world, but in neither case is there the slightest suggestion of imitation. The resemblance consists only in the fact that in the one case and in the other Mr. Rideing has entered a field already worked by Bret Harte and Thackeray, but in each field he does his own work in his own way and from his own inspiration. The pictures of a certain class of English life are, to my mind, as truthfully as they are vividly drawn. It may be taken as evidence of Mr. Rideing's success that it has brought upon him a rather savage attack from one very popular and influential daily newspaper in London, the literary critic of which denounces Mr. Rideing as an American who has drawn coarse caricatures of English society merely for the purpose of gratifying the American public. This critic evidently did not know that Mr. Rideing, like the hero of his novel, is himself an Englishman by birth. But in any case I am prepared to say that the men and women whom Tyson, young millionaire from California, met in a certain class of English West End society are not in any sense caricatures, but are faithful and lifelike portraits. Of course, Mr. Rideing never meant to suggest that these men and women who rush after and swarm around the young American millionaire in London are meant to illustrate English society in general, but they are excellent and in no sense overdrawn types of a class which does undoubtedly exist, and they need no caricature to make their presentation effective. The book, moreover, is rich in picturesque descriptions of scenery and has many passages of quiet, thoughtful and almost poetic beauty. I feel sure that Tyson has come home to a success among his English readers.

Mr. Fisher Unwin has begun the publication of a new edition of Mark Rutherford's works. The volume already issued contains the book which is described as "The Autobiography of Mark Rutherford." I may say, without unduly revealing any profound secret, that Mark Rutherford is only an adopted literary name and that the real name of the author is William Hale White. Mr. White, I may add, is the son of a late official of the House of Commons. The elder White was the author of a valuable volume embodying some of his experiences in the life of Westminster Palace. Mark Rutherford's books have always held a high place among thoughtful readers, and Mr. Fisher Unwin now hopes by issuing them in a cheap form to make them popular among all classes of readers. These books might be said to belong in a certain sense to that class of literature in which the late George Gissing made so deep a mark. But as one or two of the best of them were written before George Gissing had published anything, they cannot be accused of any want of originality and, indeed, they are artistically original in every character and every study of life. They are, in fact, studies of life in certain narrow and isolated circles; they are often melancholy and sometimes even grim, but they are full of deep thought, they take firm hold of the mind, and often touch the heart. They illus-

trate from first to last the striving of an earnest nature after the realization of all that is best in life and all that holds out hope of something better and brighter than this mere human life can be. I feel no doubt that the republication of these books will find a welcome in the United States as well as in England.

London, England.

The Electrical Theory of Solution

BY SVANTE ARRHENIUS

Professor of Physics in the University of Stockholm

Translated by J. Livingston R. Morgan, Adjunct Professor of Physical Chemistry in Columbia University.

[The development of the theory of electrolytic dissociation is one of the most important triumphs of modern physical chemistry, and no one is better qualified to tell of it than Professor Arrhenius, because to him more than to any one else the theory owes its origin. Its bearing on scientific and practical problems we discuss editorially this week. Professor Arrhenius has recently arrived in this country for the purpose of giving some lectures. He was born near Upsala on February 19th, 1859. After finishing his studies at the university there in 1884, he studied abroad, working with Kohlrausch, Boltzman, Ostwald and van't Hoff. Later he was a teacher in physics (1891) and then (1895) professor of the same subject in the University of Stockholm. During 1897-1902 he was Rector of the University. He is a member of about twenty learned societies, and for his theory of electrolytic dissociation received, in 1902, the Davy medal of the Royal Society, and in 1903 the Nobel prize for chemistry. Besides his activity in theoretical chemistry, he has investigated the conductivity of the gases and worked with questions of cosmic physics (atmospheric electricity, polar densities, applications of Maxwell's radiation experiment to cosmic phenomena, the causes of climatic changes in geological epochs), and with medical problems (influence of atmospheric electricity upon physiological phenomena and the applications of physical chemistry to serum therapeutics). He is the author of the "Lehrbuch der Elektrochemie," Swedish 1900, German 1901, English 1902, and of the "Lehrbuch der Kosmischen Physik," 1903.—Editor.]

WHEN a piece of iron is thrown into the air and then falls, we know that during the time which has elapsed it has remained the same piece of iron, with all its properties unchanged except those of lesser importance, referring to its position. The observations which one makes of the motion of the piece of iron are so commonplace, so familiar from early childhood, that any one can describe them without difficulty. Consequently, it is not surprising that this phenomenon was the first to be completely studied and described. This was done by Galileo, who made it the basis of the science of mechanics.

If the piece of iron is heated or electrified the behavior is somewhat more complicated, and in either case the changes induced in the piece of iron are less apparent. These changes have also been described very accurately and are considered by physical science, which has been built up gradually on, and cemented to, the foundation of the older mechanics.

Very much more apparent are the changes which take place when the piece of iron (at a high temperature) unites with the oxygen of the air. This action gives rise to an entirely new substance, black and earth like (it is the flake observed when glowing iron is hammered), which has no resemblance to polished metallic iron, and still less to gaseous oxygen.

The occurrence of actions of this kind in every day life is relatively rare, and so it is very difficult to arrange them from a general point of view. It was for this reason that those who first studied such so-called chemical processes were looked upon by the public as

dealers in magic. And it was only later, by aid of the scientific treatment of the subject, that chemistry, which may still be considered in its infancy, arose.

On account of the slight connection between chemical phenomena and the experiences of daily life, it is even more difficult to treat them in a popular way than it is physical phenomena. Notwithstanding this, at the request of the editor of THE INDEPENDENT, I will try to present briefly the idea of the theory of Electrolytic Dissociation.

PROFESSOR SVANTE ARRHENIUS

Among the substances used by the old alchemists, salts, acids and alkalies were the most important. By mixing solutions of these, they obtained instantaneously and with great regularity products with a definite composition, which also possessed the properties of salts, acids or bases. By entirely different processes—*e.g.*, by mixing hydrochloric acid and caustic soda or hydrochaloric acid and Chile saltpeter, as well as by mixing any chloride with any sodium salt—we obtain in the solution a salt which crystallizes in cubes when the solvent is removed by evaporation, and which is found to be identical with table salt. This salt, no matter how it is obtained, whether by a chemical process or by the evaporation of seawater or from a rock salt quarry, has always the same composition—viz., 39.41 per cent. sodium and 60.59 per cent. chlorine.

If we dissolve this salt in water and crystallize it out again, either by high or low temperature, or by addition of a suitable reagent, as concentrated hydrochloric acid or alcohol, we always get the same salt with the same composition.

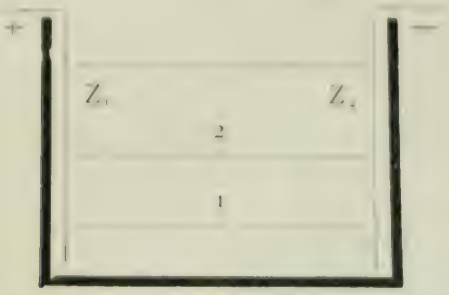
This general result would naturally be expressed in this way: In solution the salt remains as it is, except that it is mixed with molecules of water, and so has lost its solid form. Nothing could appear more contradictory than the supposition that the salt in the water solution is decomposed, partly into sodium, partly into chlorine. We would expect, then, that by crystallizing under different external conditions table salt could be obtained which would not contain exactly 39.41 per cent. of sodium. We would also expect by this peculiar hypothesis that the solution of table salt would possess the properties of a solution of chlorine, with its characteristic odor and strong oxidizing power; such, however, is not at all the case. Further, how can we picture to ourselves a solution of sodium? If we try to dissolve sodium in water we form caustic soda, while hydrogen gas is evolved.

We cannot help wondering, then, how the mathematical physicist, Clausius, in the year 1857, could suggest that the conduction of electricity by a solution of table salt can only be explained by the assumption that certain salt molecules in the aqueous solution are decomposed into chlorine and sodium. This idea was apparently so impossible that no chemist would accept it, even when Clausius further explained that for his purpose the decomposition of but very few molecules was necessary. For this reason he modified his hypothesis to a less striking form, and assumed that an exchange of atoms takes place among the different sodium chloride molecules.

And yet we are forced now to consider that a 5 per cent. solution of table

salt *is* decomposed to the extent of 70 per cent. of its molecules into the atoms chlorine and sodium. It is, however, not ordinary chlorine and sodium, for these bodies carry upon them great charges of electricity, so that on one equivalent (= 35.5 grams) of chlorine we have 96,500 coulombs of negative, and to one equivalent (= 23.1 grams) of sodium just as much positive, electricity. The chlorine and sodium in this form are to be considered as allotropic modifications of the ordinary chlorine and sodium known before. Just as carbon can exist as lampblack and diamond, so can chlorine exist in two dissimilar forms—*i.e.*, as the green gas and as the colorless chlorine *ion*, charged with negative electricity. To these electrically charged portions of the molecule the name *ion*, as first used by Faraday, is given. In the same way we have two different forms of the element sodium—*i.e.*, metallic sodium and the ion of sodium.

These difficulties can be avoided in this way, but the constant composition offers another difficulty. Assume that we have a mixture of sugar and table salt in an aqueous solution, and that we carefully superimpose upon it a layer of pure water, avoiding mechanical mixture. The molecules of sugar and salt will go from the solution into the water. This process is called diffusion. The salt molecules go approximately four times as fast into the upper layer as do those of sugar. We obtain, then, in the lower original solution a smaller ratio of salt to sugar than was present at first, while in the upper layer the ratio is reversed. We employ diffusion in practice to purify salts from slow moving bodies.



We must expect, then, that something of the same sort will take place in the sodium chloride solution in case the sodium chloride molecules are decomposed into chlorine and sodium, especially as electrical measurements cause us to conclude that the chlorine ion is one and one-half times as mobile as the sodium ion. By a like experiment, however, we observe that this action does not take place. This is explained by the fact that electricity moves with the ions. When the layer of water is placed upon the salt solution a slight excess of chlorine ions is observed in the water and a corresponding excess of sodium in the sodium salt solution. By this action, however, the water becomes negatively, the solution positively, charged, and in consequence of the repulsion of bodies charged with electricity of the same sign the chlorine ions are forced downward into the solution, the sodium ions upward into the water, so that the action of diffusion is paralyzed. Owing to the enormous charges on the ions, this action takes place in a vessel of ordinary dimensions when a ten billionth of a milligram of sodium is in excess in the salt solution. This quantity is about a billion times smaller than the smallest which we can detect by chemical methods. With an electrometer, however, it is quite easy to determine accurately the charges in the above experiment. This is a very good example of the extraordinarily valuable service done by electrical measurements in chemical investigations. Nernst, who investigated theoretically and experimentally the electromotive forces produced in this way, found that they could be calculated from the principles outlined above. That which at first was considered a difficulty in the way of the new views is thus transformed into a support.

After disposing in this way of the arguments against a dissociation of dissolved salts into ions, it is important to see what great advantages can be derived from it.

Let us recall the phenomenon which led Clausius to suggest a similar idea. When the electric current is conducted through an aqueous salt solution only the smallest electrical force is necessary to drive it through the solution. By this, according to the view accepted at the time, the molecules were broken up into ions, which then reunite. The slightest electrical force then suffices to decompose the molecules. In other words, the salt molecules are not held together at all.

Such theoretical grounds are difficult to judge at their correct value. We can, however, draw further consequences from them, and then, by the aid of experiment, ascertain the truth of these. Let us assume that a part of the salt molecules are decomposed into their ions, and that it is just these ions which transport the electricity. The power of transport of these carriers of electricity de-

pends upon their amount and the velocity with which they pass through the surrounding water. Imagine a 1 per cent. solution of sulphate of zinc in a trough with plane parallel walls, two of which are lined with amalgamated zinc

plates. The figure shows this in section, Z_1 and Z_2 being the zinc plates, and 1 being the level of the solution. Connect a definite electromotive force from a galvanic cell to the plates Z_1 and Z_2. A current will then flow, the strength of which, I_1, will depend upon the driving force and the amount of ions in the solution. If water is now poured in up to the level 2 and mixed thoroughly, we know that the current strength will remain unchanged, unless the number of the ions changes with the dilution. Altho the driving force remains the same, as well as the medium (water), in which the ions move, we find that the current strength has increased somewhat; we will call it I_2. From this we conclude that the number of decomposed molecules has increased. If we pour in more water the current strength increases again, and this continues with each new addition of water. The current strength does not, however, increase to infinity, but only to a certain limit, which we may call I_∞. What does this limit mean? The simplest way of explaining it is by assuming that the limit is the point at which all molecules of zinc sulphate are decomposed.

It is now easy to calculate how many of the molecules are decomposed in the first 1 per cent. solution, for if all molecules were decomposed the current strength would have been I_∞; it is, however, only I_1. The degree of dissociation—*i.e.*, the fraction of the molecules decomposed to the total number—is $I_1 \div I_\infty$. The experiment shows this to be about 0.40.

All salts are found to behave in the same way as the zinc sulphate. Almost all, however, are decomposed to a very much greater extent than this—*e.g.*, sodium chloride in a 1 per cent. solution to about 80 per cent. The strong acids and bases, as hydrochloric acid and caustic soda, are largely dissociated, while on the other hand the weak ones, as acetic acid and ammonia, are dissociated but slightly.

Suppose the question is asked, Can we not verify these far-reaching and for chemical purposes satisfactory conclusions by help of other phenomena? Fortunately, there is a way to do it. Raoult has devised a method by which the number of molecules in a solution can be found and van't Hoff has given the method a firm theoretical foundation. According to Raoult and van't Hoff, solutions which contain the same number of molecules of dissolved substance per liter of the same solvent have the same freezing point. When we dissolve a gram molecule of alcohol (46 grams) in a liter of water in one vessel and in another a gram molecule of sodium chloride (58.6 grams), we have two solutions which, according to ordinary chemical views, contain the same number of molecules. Notwithstanding this, however, the freezing point of the sodium chloride solution is found to be almost twice as far below the freezing point of pure water as that of the alcohol solution. The two freezing points are, in fact, $-3.46°$ and $-1.89°$ C. It is necessary to dilute the salt solution about in the ratio $3.46 \div 1.89 = 1.83$, in order that its freezing point becomes $-1.89°$ C.; at this dilution we have the same number of molecules as is contained in the alcoholic solution. This abnormality can be explained by the assumption that the sodium chloride is 83 per cent. dissociated into sodium and chlorine ions, for the dissociated molecules have the same effect as two simple ones. We find nearly the same number as before, about 80 per cent., to which the sodium chloride molecules are dissociated.

The examination of the results for about ninety substances in aqueous solution shows the same good agreement; they might be analyzed by the conductivity or freezing point methods. In this way the solid foundation of the theory was laid. The consequences of the assumption are interesting. All the prop-

erties of a salt solution are made up of the properties of the water, the undissociated salt molecules and the ions. In dilute solutions the undissociated molecules are few and the properties of the salt solution, neglecting those of the water, are the sum as those of the ions. Such properties for this reason are called additive. These peculiarities of salt solutions have long been known and investigated. Such properties, for example, are the specific gravity, the compressibility, the capillarity, the viscosity, the coefficient of optical refraction, the natural rotation of the plane of polarized light, the magnetic properties and the physiological action of salt solutions. In general, as soon as a property of salt solutions is investigated it is found to be peculiar in that it is additive. In this respect the color of salt solutions is very striking, as was shown by Ostwald, and later by others. All permanganates, for example, give the same absorption spectrum. In all these very dilute solutions the same ion, MnO_4, is present to the same concentration, and consequently the absorption spectrum is identical in all cases.

In chemical reactions the change of color is often used to recognize the end-point. This phenomenon depends on the fact that all salts with the same colored ion give the same color reaction. The law can also be expanded to consider other cases where a characteristic, difficultly soluble salt is formed. Thus, for example, all chlorides give with silver nitrate a characteristic curdy precipitate of silver chloride. We say, then, silver nitrate is a reagent for chlorine. It is more correct to say that it is a reagent for chlorine ions. There are a number of organic compounds which contain chlorine but do not give silver chloride on addition of silver nitrate. This is also true for potassium chlorate ($KClO_3$), the salt which is used in "parlor" matches. This contains chlorine, but not as an ion, for its ions are potassium (K) and ClO_3 — in general, the ions of a salt are the metal, here K, and the rest of the salt, in this case ClO_3. On heating, potassium chlorate is decomposed with an evolution of gaseous oxygen, and potassium chloride remains behind; this, when dissolved, gives the reaction for the chlorine ion, so that the presence of chlorine in potassium chlorate is proven.

By expanding these ideas Ostwald has succeeded in placing the whole subject of analytical chemistry upon a rational basis, a thing which it previously lacked.

The ions show a much greater activity than other substances, and this has caused the following thesis to be formulated: It is only the ions which react chemically. Altho this law cannot be taken as perfectly general, even tho its application is wide, it does prove that the ions are very much more active chemically than any other substances.

In catalysis the ions play a very peculiar *rôle*. When an acid is added to a sugar solution the sugar is transformed into dextrose and levulose, and we say it is inverted. The progress of the inversion can be followed by aid of the polariscope. The velocity of inversion is found by this means, at constant temperature, to be dependent on the concentration of ions in the acid. Therefore, the laws of chemical activity and conductivity (or more properly ionic concentration) are parallel. Shortly after I announced this law in 1884 Ostwald verified it for certain cases, and later found it to be true for all cases.

When a number of ions are present in the same solution with undissociated molecules, they must exist together in a chemical equilibrium, to which the law of Guldberg and Waage can be applied. The results of Ostwald and Bredig for the equilibrium of weak acids with their ions and for weak bases with their ions show that the agreement with this theory is nearly perfect. I have studied more complex cases where several salts or acids, together with their ions, are present; and, again, the agreement is striking. Thus, for example, the strength of a solution of acetic acid is considerably decreased by the addition of an acetate. In the same way the partition of a base between two acids—the so-called problem of avidity—can be calculated and the values are found to agree perfectly with the results of the measurements of Thomsen and Ostwald. Finally, the solvent itself—*i.e.*, water—can be considered as a weak acid or a weak base and thus explain the phenomena of hydrolysis. Such a process is the partial decomposi-

tion of potassium cyanide in solution into caustic potash, and hydrocyanic acid. All these phenomena which were unexplained by the old chemistry can be readily explained and even calculated by the ionic theory.

Another reaction of great interest which has been explained by the ionic theory is the neutralization of an acid by a base, one of the most important of all chemical processes. It was noticed that when both acid and base are strong (in which case, according to the ionic theory, they can be regarded as completely decomposed into ions), the heat evolved amounts to 13,700 cals. per gram equivalent. This is nothing more than the heat of formation of water from its ions, $\overset{+}{H}$ and $\overset{-}{OH}$. We have, for example, in a very dilute solution caustic soda ($\overset{+}{Na} + \overset{-}{OH}$), to which is added hydrochloric acid ($\overset{+}{H} + \overset{-}{Cl}$); the reaction then is:

$$\overset{+}{Na} + \overset{-}{OH} + \overset{+}{H} + \overset{-}{Cl} = \overset{+}{Na} + \overset{-}{Cl} + HOH$$

This water is formed from the $\overset{+}{H}$ and $\overset{-}{OH}$ ions, which are independent of the nature of the acid and base. For weak acids and bases there are slight variations, which can, however, be calculated from their conductivities.

The ionic theory has thus explained a large number of the important facts of chemistry, and consequently is generally accepted. It has a particular meaning for physiological chemistry, for the fluids of the body consist of aqueous solutions of substances which to a great extent are dissociated into ions.

The ionic theory has added a new form of matter to the forms already known, this being characterized by a combination of electricity and matter. This new form plays the principal *rôle* in chemical processes. It is marvelous to observe in each additional investigation into natural phenomena how this wonderful agent, electricity, is found to govern them all. The phenomena of light are, according to Maxwell, nothing but the manifestations of electrical force, and in chemical processes electricity plays a principal part.

Esperanto: A New International Language

BY LAZARO LUDIVIKO ZAMENHOF

[Dr. Zamenhof is the latest of those intrepid philologists who from time to time attempt to alleviate the calamity which fell upon the human race at the Tower of Babel, notwithstanding the apparently hopeless nature of their undertaking and the oblivion and contempt which have been the fate of their predecessors. "Esperanto" is, however, more promising than "Volapük," which is, or, perhaps, it is more correct to say, was, a highly inflected language, like Greek, Latin, Sanskrit, Russian, and German, while "Esperanto" goes even beyond English in being a grammarless tongue. Dr. Lamenhof was born in Bialzstock, in the department of Groduo, Russia, December 15th, 1859, and was educated at Warsaw, where he is a practicing physician. His polyglot environment impressed upon his mind at an early age the need for an international medium of intercourse, and in 1878 he had contrived his new language, which he taught to his fellow students in the preparatory school. After working on it for nine years more he considered ready to publish his first pamphlet, which he did at his own expense, since no publisher would take the risk. Our readers can judge of the appearance of the language from the example, part of a letter from the author, which we copy from *The Esperantist*, at the end of the article.—EDITOR.]

ESPERANTO is a neutral compounded language which aims at supplying men of divers nationalities with a means for mutual intercourse. Many erroneously fancy that Esperanto seeks to supplant existing tongues, whereas nothing of the kind is desired. At home and in the family circle all will ever converse in the national idiom: Esperanto will but serve them as a basis for communicating with those who are ignorant of their language.

LAZARO LUDIVIKO ZAMENHOF

In order to enjoy correspondence with foreigners it is at present necessary to learn *at least* four or five other languages. This is so difficult that it is possible of attainment to but a few persons; and these favored few can only understand a few languages. The rest of the world is for them a sealed book. On the other hand, did an international medium exist, it would only be necessary to learn this in addition to one's national tongue in order to understand and to be understood by the whole world.

The well-informed have been working at this problem of an international language during the last two centuries. Many attempts to form such an idiom have been made, but all propositions have dwindled away to the vanishing point, for the matter was discovered to be extremely difficult. Not until the end of the nineteenth century did two systems appear which seemed to be really practicable, and which found many adherents. These were Volapük and Esperanto.

But the competition between these two systems was not of long duration, since Esperanto's great superiority over its rival was too evident to all. At the present time Volapük has long been cast aside and all friends to the cause of an international language have rallied round the Esperanto standard.

(1) Is the existence of a neutral compounded language possible?

Even now there exist, among those ignorant of the matter, many who contend that such a language cannot exist, since language is organic and cannot be created, and so on. Facts are the best witnesses to prove that this is folly. Any one who does not close his eyes on purpose can assuredly be readily convinced that such compounded languages have long been in existence, that hundreds of thousands of people belonging to different lands and nationalities correspond by them with each other and carry on the most lively oral communications on all kinds of subjects and understand each other as well as if they had been using their mother-tongue, altho not one of them knows the national language of his interlocutor. It is truly absurd to question the practicability of the language in the face of such proofs as these. It resembles the argument of a German society about the possibility of constructing locomotives when, for some years, England had been making use of railways and had found them capable of fulfilling all requirements.

(2) Why should not some extant language, such as English, be selected for the international medium?

To select for international purposes any natural language would never be possible. The self-esteem and self-preserving instincts of all nations could never permit it. The people whose language was selected would gain a truly great superiority over the rest, and would soon overwhelm all other peoples. But even should we admit that all nations could, on their own initiative, select such an already existing language, none would be the gainer, for all natural tongues are so exceedingly difficult that their mastery would only be possible to those endowed with plenty of spare time and money.

For centuries past studious youths have spent long years in learning Latin, yet are there to be found many able to make free use of this tongue? Yet had the same youths spent *but a tenth of the time* in mastering the international auxiliary every human being would now

be intelligible to his fellow. In a few weeks one can learn Esperanto sufficiently well to be able to communicate one's ideas with freedom.

(3) Would it not be doubtful wisdom to learn Esperanto to-day, as maybe to-morrow some other and superior language may put in an appearance, and displace Esperanto, with the result that we shall have to start afresh and learn another new language?

Even should one really fear that to-morrow will bring a language better than Esperanto, it would still be unwise not to learn Esperanto to-day, just as it would have been foolish to delay the construction of railways for fear of the discovery of an improved method of locomotion. But in reality we have no need to fear for Esperanto's future. All critics have come to the conclusion that the international language of the future must embody the following two requirements: (I) Its grammar must be as simple as possible. (II) Its vocabulary must consist of such root-words as are in form recognizable to the greatest part of the civilized globe, in other words, those which are to be found in the largest number of cultured languages.

These two postulates precisely illustrate the principles underlying the construction of the Esperanto language. What, therefore, could a further new language introduce?

Esperanto's entire grammar consists of but sixteen brief and simple rules, which can be mastered in half an hour. Can the possible new language submit a more simple grammar and would the world consent to reject the thoroughly elaborated, well tried and largely diffused Esperanto in favor of a new tongue, whose grammar could possibly be mastered in twenty-five minutes, instead of in thirty?

And as all words of the most international form have already been incorporated into Esperanto it follows that these words must constitute the vocabulary of this ideal language.

Let all, therefore, rest assured that, altho Esperanto may possibly at some future date be made more perfect, the elaboration of a new scheme is absolutely out of the question.

(4) What are the principal characteristics of Esperanto?

It is remarkably easy to acquire. While the study of any other language demands many years' application, one can gain a really good working knowledge of Esperanto in a few weeks. Moreover, men of education can often read this language freely after some hours' study. Take Leo Tolstoy, for example. He says:

"So great is the facility of learning Esperanto that, having received a grammar, dictionary, and an article in that language, I was able, after not more than two hours, if not to write, at any rate to read the language freely. In any event the sacrifices any speaker of a European tongue would make in devoting some time to the study of Esperanto are so small, and the results which could thereby be achieved are so enormous, if all, at least Europeans and Americans—all Christendom—should comprehend this tongue, that the attempt at least should be made."

The remarkable simplicity of the language is brought about by the fact that not only is the grammar capable of being learned in half an hour, and is free from all exceptions, but also because it also possesses divers rules by which all are able to coin other words from any given root without being forced to learn them. Thus, for example, the prefix MAL signifies absolute opposites. (*Bona,* Good, *Malbona,* Bad.) Thus, having learnt the words *Alta, Dika, Proksima, Luma, Ami, Estimi, Supre,* etc., meaning *High, Thick, Near, Light, To Love, To Esteem, Above,* etc., none need learn the opposite words *Malalta, Maldika, Malproksima, Malluma, Malami, Malestimi, Malsupre,* which signify *Low, Thin, Far, Dark, To Hate, To Despise, Below,* etc. Thus all can manufacture for themselves the opposite to any known root by making use of the prefix MAL. Also IN is used to form feminines. Knowing that *Patro, Frato, Filo, Edzo, Koko, Bovo,* etc., mean *Father, Brother, Son, Husband, Cock, Bull,* one need not learn the words *Patrino, Fratino, Filino, Edzino, Kokino, Bovino,* etc., which are represented in English by the totally different words *Mother, Sister, Daughter, Wife, Hen, Cow,* etc.

A further example is afforded by the suffix IL, which indicates an instrument by whose instrumentality an action takes place. Thus, having learnt that *Sonori, Kombi, Kudri, Plugi* mean in English

To Ring, Comb, Sew and *Plough*, we at once know that *Sonorilo, Kombilo, Kudrilo, Plugilo* mean *A Bell, Comb, Needle, Plough*, respectively. Of these affixes, which serve to simplify and abbreviate the language in such a remarkable manner, there exist about forty in Esperanto.

From every word one can form for himself the substantive, adjective, verb, adverb, participles, etc., by simply adding the requisite termination. Take, for example, the root *Mort*, which signifies the idea of *Death*. All know at once that *Morti* means *To Die, Morto, Death, Morta, Mortal*, etc., *for all nouns end in o, present infinitives in i, adjectives in a, and so on.*

It is, therefore, unnecessary to learn these parts of speech separately. One can also combine any preposition with any other word and thus obtain without study all possible shades of human thought. Thanks to this, Esperanto, in spite of its remarkable simplicity, is as rich and flexible as any existing language.

In fine, from every root-word one can form an endless array of derivatives, and that root-word is generally known to any educated civilized person, as Esperanto's vocabulary consists of such words as are used in the majority of important languages (such as *Botaniko, Direktoro, Telegrafo, Portreto, Formo*, etc.).

Nowadays Esperantists of one nationality are constantly visiting fellow students abroad. After studying the language for some days or weeks, many Esperantists have traversed the whole of Europe, which has hitherto been closed to them. At all points they meet fellow Esperantists, who receive them as brethren, and with whom they converse on whatever matter they please.

Moreover, one must also bear in mind that one can be understood in Esperanto not merely by those who already know that language, but also by those who are totally ignorant of the same! Esperanto is so constructed that, on writing anything in the language, it is comprehensible to the recipient, thanks to a compact dictionary and grammar printed in a broadsheet. This is a unique property not possessed by any national tongue. Take, as illustration, the German phrase: "*Ich weiss nicht wo ich meinen stock gelassen habe.*" (*I don't know where I have left my stick.*) On referring to a German-English dictionary we find: "*I white not where I to think story dispassionate property.*"

The last named quality of Esperanto has an incalculable practical significance, for it at once makes the whole world able to understand a solitary Esperantist. When the latter needs to write a letter to any foreign country, he no longer need seek out men who understand the language of that country and ask them to write a letter for him, but he himself writes direct in Esperanto, and incloses with the letter the broadsheet already referred to, printed, of course, in the language of the recipient. The latter is at once able to understand the letter.

In spite of its purely mathematical construction, Esperanto is agreeable to the ear withal. In sound it much resembles Italian. I will quote the following lines to illustrate this:

"En la mondon venis nova sento,
Tra la mondo iras forta voko;
Per flugilo de facila vento
Nun de loko flugu ghi al loko."

(5) What is the present condition of Esperanto?

At the present time there scarcely exists any country which does not contain many Esperantists. In a great many cities Esperanto clubs and societies exist, as well as reading circles and classes. For example, in Paris alone there are no less than thirty classes in Esperato in various parts of the city.

To those who wish to become acquainted with the present state of Esperanto in the world I recommend the brochure published by the Lyon Esperantist Group. As a result of an inquiry based on information from all Esperantist centers, this group has published "*La diffusion de l'Esperanto dans la monde.*" The committee making the inquiry consisted of the following persons: M. Cledat, head of the Literary Side of the Lyon University, Professor of Philology at the University and Director of *La Revue de Philologie Française*. Dr. Dor, Honorary Professor of the Berne University; M. Drodin, Agent de Change; M. Ferouillat, proprietor of the "Lyon Republicain;" M. Legouis, Eng-

lish professor at that university; M. Offret, Professor of Mineralogy at the said university and Vice-President of the French Mineralogical Society, as well as being the General Secretary of the Lyon Esperantist Group; M. Patricot, Director of an assurance society; M. Quinson, silk manufacturer; M. Soulier, Professor of Therapeutics at the Lyon University (Medical Side); M. Toucheboeuf, retired silk manufacturer.

Some twenty-five magazines and gazettes are now published in Esperanto, among which is one specially devoted to scientific matters, published by the well-known firm Messrs. Hachette, under the patronage of the following persons and societies: The French Physics Society, the International Society of Electricians, Professors Adelskjold (Stockholm), Appell (Paris), D'Arsonval (Paris), Baudoin de Courtenay (St. Petersburg), Berthelot (Paris), Prince Roland Bonaparte; Professors Bouchard (Paris), Becquerel (Paris), Brouardel (Paris), Deslandres (Paris), Duclaux (Paris), Förster (Berlin), Haller (Paris), Henri Poincaré (Paris), Sir W. Ramsay (London), General Sébert (Paris).

Esperanto also possesses a literature already rich, which, in addition to textbooks and dictionaries in nearly all European tongues, contains a considerable number of original works and translations, including metrical translations of Shakespeare's Hamlet, Homer's Iliad, Byron's Cain, and many others. The titles of all Esperanto publications are to be found in the world-wide "Address Book of Esperantists," published by Messrs. Hachette, of Paris

While there at present exists scarcely a single important country in the civilized world which does not possess its Esperanto center and gazette, the United States of North America have hitherto formed a strange exception. In the United States, which, owing to the cosmopolitan nature of their inhabitants, is bound to play a leading part in the adoption of the international key language, there does not at present exist any central society of Esperantists. There is an Esperanto section to the St. Louis Exhibition, and it is to be hoped that this will arouse much new interest in the Esperanto cause. Pending this happy state of affairs all in the United States who wish to become identified with the movement, which has such an important bearing on the future welfare of humanity, and also those who merely wish to procure the *Complete Textbook of Esperanto in English* (*price, 40 cents*) *and The Esperantist Monthly* (*75 cents per annum*) should apply to the London Esperanto Club, 41 Outer Temple, London, W. C.

ESPERANTO.

Ankoraŭ unu cirkonstanco igis min por longa tempo prokrasti mian publikan eliron kun la lingvo: dum longa tempo restis nesolvita unu problemo, kiu havas grandegan signifon por neŭtrala lingvo. Mi sciis ke ĉiu diros al mi: "Via lingvo estos por mi utila nur tiam, kiam la tuta mondo ĝin akceptos; tial mi ne povas ĝin akcepti ĝis tiam, kiam ĝin akceptos la tuda mondo." Sed ĉar la "mondo" ne estas ebla sen antaŭaj apartaj "unuoj," la neŭtrala lingvo ne povis havi estontecon ĝis tiam, kiam prosperos fari ĝian utilon por ĉiu aparta persono sendependa de tio, ĉu jam estas la lingvo akceptita de la mondo aŭ ne.

Pri tiu ĉi problemo mi longe pensis. Fine la tiel nomataj sekretaj alfabetoj, kiuj ne postulas ke la mondo antaŭe ilin akceptu, kaj donas al tute nedediĉita adresato la eblon kompreni ĉion skribitan de vi, se vi nur transdonas al la adresato la ŝlosilon—alkondukis min al la penso aranĝi ankaŭ la lingvon en la maniero de tia "ŝlosilo," kiu, enhavante en si ne sole la tutan vortaron, sed ankaŭ la tutan gramatikon en la formo de apartaj elementoj. Tiu ĉi ŝlosilo, tute memstara kaj alfabete ordita, donus la eblon al la tute nedediĉita adresato de kia ajn nacio tuj kompreni vian Esperantan leteron.

WARSAW, RUSSIA

FREE ENGLISH TRANSLATION.

Yet another circumstance compelled me to postpone for a long time the appearance of my language; for many years another problem of immense importance to a neutral language had remained unsolved. I knew that every one would say "Your language will be of no use to me until the world at large accepts it, so I shall make no use of it until every one else does." But since the world at large is composed only of its units, my neutral language could have no future until it was of use to each separate unit independently of whether the world at large accepted it or not.

This problem I considered for a long while. At last the so-called secret alphabets, which do not necessitate any prior knowledge of them, and enable any person not in the secret to understand all that is written if you but transmit the key, gave me an idea. I arranged my language after the fashion of such a key, inserting not only the entire dictionary but also the whole grammar in the form of its separate elements. This key, entirely self-contained and alphabetically arranged, enabled any one of any nationality to understand without further ado a letter written in Esperanto.

Literature

Books on the Old Testament

The Book of Numbers is commonly considered one of the least of the books of Scripture, both in interest, in importance and in religious value. It opens with one of the dullest and most monotonous sections of the Old Testament, the census of the tribes in the wilderness of Sinai. It continues through ten chapters with descriptions of camp arrangements, rehearsal of the duties of the several Levitical families, and various laws and regulations of quite minor importance. The book has no unity of subject, and narrative and legal material are mingled in such confusion that there is no connected story, while the laws are concerned with such a variety of topics that they offer no clear view of Hebrew institutions. Nevertheless, Numbers is our sole source of information of the life of Israel in the desert, the nomadic period of Hebrew history; it contains some of the earliest fragments of poetry preserved in the Old Testament, is our chief authority on such important Hebrew institutions as the Levites and the Nazarites, and includes the story of Balaam, so interesting and important from many points of view.

A good commentary on Numbers is, therefore, very necessary. That of Professor Gray* in the International Critical Commentary will rank as one of the best in that excellent series. It is a work of ripe and thorough scholarship, and combines painstaking exactness and accurate learning with sound critical judgment and real historical insight. The author has viewed his text, not as a mere series of lexicographical puzzles, but as a document in the history of a nation. He has produced, therefore, not only a commentary which will be likely to continue as a standard for many years, but also a contribution to the study of Hebrew religion and history. The importance of the Numbers is in such points as the law of the ordeal, the Nazarite cutting of the hair, the story of the brazen serpent—reflections of some of the earliest practices of Hebrew religion—rather than in the unhistorical census figures and descriptions of camp arrangements and late priestly institutions.

The division of Numbers into documentary sources is practically the same in the commentary and in the new translation and rearrangement of the Old Testament by Professor Kent.† Previous endeavors to show the literary structure of the Old Testament by printing devices have seldom gone farther than the Hexateuch. The Student's Old Testament is to classify the entire Old Testament into six volumes, dividing it into history, prophecy, laws, etc. This first volume includes the historical portions as far as the book of Ruth. The documents are printed in parallel columns, and the text is divided into convenient sections with appropriate headings. The notes are trustworthy, tho sometimes too brief, and the introduction is excellent, presenting the facts as to the legendary character and historical untrustworthiness of much of the material clearly, but without needless offense. The translation aims first at exactness, and is somewhat literal. The book is designed for popular use, and presents the present conclusions of Old Testament scholars as to the origin and character of the first eight books of the Bible in more convenient form and at less cost than has heretofore been available.

Mrs. Thomas's history of Israel to the time of Samuel‡ is designed for children. The salient incidents are selected, and the stories are retold in a simple and interesting manner. Reproduction of famous paintings of scenes described in the text and the insertion of several beautiful poems founded on events in Israel's early history make the book attractive.

* A Critical and Exegetical Commentary on Numbers. *By George Buchanan Gray, M.A., D.D.* New York: Charles Scribner's Sons. $3.00.

† Narratives of the Beginnings of Hebrew History. *By Charles Foster Kent, Ph.D.* New York: Charles Scribner's Sons. $2.75.

‡ The Early Story of Israel. *By Evelyn L. Thomas.* New York: Longmans, Green & Co. 90 cents.

But, despite the purpose announced in the editor's preface to "set forth nothing inconsistent with the results of Biblical and historical criticism," the story of Israel here told is not the history of Israel as Professors Kent and Gray understand it. It is the history written by Stanley 40 years ago, not the history of Wellhausen and H. P. Smith. This may be better for children, but it does not fulfil the promise made for the book in the editor's preface.

Mr. Todd's volume§ is professedly an application of the bread-and-butter theory of history to the Old Testament. It attempts to construct Hebrew history on the theory that "the two main preoccupations of man, wherever we find him, are, first, to earn his dinner, and, second, to eat it." The Israelite has been regarded as a religious man, "saying grace before meat, but caring nothing for the dinner." Such an Israelite is a "ghost," a "lifeless simulacrum" to Mr. Todd, and he proposes a history "translated from the dreams of prophets to the vitality of practical politics, in the literal meaning of that phrase," a history "made actual at every stage," in which Israel's religion is simply "the theological counterpart of the city-state of Jerusalem."

If the author had carried out his theory consistently at every point, his book would not contain the excellent interpretations of Elisha, Amos and Hosea which it offers. Mr. Todd is a suggestive writer and a man of broad powers of generalization, and his history is better than his historical principles. The conclusion that the Old Testament is "the *epos* of the Fall of Jerusalem," that that disaster and the consequences which followed form the subject of the whole, that the parallel of Jerusalem is to be sought in the city-states of the Mediterranean rather than in the world-empires of Asia, may not win favor; but many of the details in Hebrew history are described with remarkable power and vividness, and the work commands one's interest and suggests new points of view and new interpretations of many events. The book is better in details than in its larger outline, tho conjectures sometimes have too much color of facts, as in the suggestion that the Levites were descendants of the Canaanites (p. 62), that David received Hebron from the Philistines (p. 76), that the members of the early prophetic order could be known from tattooing on the face (p. 91). The argument for the importance of Elisha (p. 150) and the description of Assyria (p. 114) remind one of the best writing of George Adam Smith.

§ POLITICS AND RELIGION IN ANCIENT ISRAEL. *By Rev. J. C. Todd, M.A.* New York: The Macmillan Co. $1.50.

The Eighteenth Century*

IN the death of Sir Leslie Stephen we have lost our best contemporary critic. Cool, cautious, shrewd, reasonable, laborious, he represents, in English, criticism of the advanced and modern type, criticism historical and scientific at its best. That criticism had and still has its disadvantages. It is too exclusively explanatory, too much inclined to deal with books as phenomena which have only to be accepted and accounted for as results of something else, too negligent of the message in the pursuit of accessories and conditions. For, after all, there is a difference between scholarship and criticism; and whereas the scholar exists to restore and rehabilitate the past, the critic exists to discover and reveal what lesson it may have for the present. In this sense, therefore, if the distinction is to be made, we must recognize that there is more, perhaps, of the scholar than of the critic in Stephen's work.

It must be evident to any one who has ever attempted to read another literature than that of his own period how difficult it is to get on without some knowledge of the political and social conditions of the time. And the statement is particularly true of the literature of the eighteenth century, which is in a manner peculiarly local and occasional. At the same time there is much in that literature which is likely to be of great value to us at present if we could but read it. Its great strength, for instance, is a keen sense for intellectual order. If you are looking for mystery, illusion, wonder, you shall not find them in the eighteenth century. But you will find, instead, reason, good sense, a sharp eye for conduct

* ENGLISH LITERATURE AND SOCIETY IN THE EIGHTEENTH CENTURY. *By Leslie Stephen.* New York: G. P. Putnam's Sons. $2.00.

and character. Besides, it was a literature of the whole, of all the very best there was in its time, a literature neither rustic nor provincial, but urban and urbane. It is by these qualities that eighteenth century literature is classical —by its hatred for confusion, obscurity and vagueness. Its virtues are propriety, moderation and taste. And if it has also the defects of its virtues—if it falls into commonplaceness, artificiality and dogmatism—yet it does at best offer a corrective to some of our most inveterate faults. The difficulty is to get at it properly, and that cannot be done without an understanding of the life of the time, of which the literature is, in Stephen's opinion, but a function or "by-product." This, then, is the office that the volume fulfils and, on the whole, fulfils admirably.

Literature, in the author's opinion, is mainly a mode of social activity. It consists largely in applying a set of "symbols" to the ideas which happen to be in power, and is therefore determined (as far as it is calculable, for genius is allowed to be an incalculable term) by the community in which it flourishes and particularly that part of the community which constitutes the reading public. In this way is made up "the literary organ," including public and authors with the ideas which they represent; and the problem, at least for our present critic, is to determine this literary organ for any given period. As regards the solution, the book is a sort of digest of the writer's former works—his "English Thought in the Eighteenth Century," his lives of Johnson, Pope and Swift—from the point of view of literature. In this way the volume has a body, a solidity, a compactness very rare indeed in current criticism. Some blemishes there are. He is inclined from time to time to drop into a kind of pseudo-scientific jargon. He misses, it seems to us, the right point of view for the Comedy of the Restoration, treating it like tragi-comedy and not pure comedy. But, on the whole, the performance is, in general method, an example to literary history and is likely to remain a model to English literary scholarship for many a day.

William Pepper

Toward the middle of the last century a company of quiet-loving Philadelphians, seeking an afternoon nap at a summer hotel, were aroused by a tremendous hubbub in the corridor. The noise maker proved to be a four year old, armed with two sticks, with which he beat on the doors of the various bedrooms, shouting the while at the top of his lungs: "No one shall sleep in this house this afternoon, I say, if I can help it!" This four year old was William Pepper. Fifty years afterward some one hearing this story of his infancy remarked: "And no one has slept in Philadelphia for years because of that same William Pepper." This story, which Professor Thorpe tells, is characteristic of the man and his life. He set out to wake up Philadelphia, and, with ceaseless and restless energy, he pounded on the door of every Philadelphian who tried to sleep, demanding his assistance in work, civic or educational, until he had levied a contribution of money, time or energy.

Professor Thorpe gives this brief *resumé* of his public work for Philadelphia: He founded the University Hospital, the Commercial Museums and the Philadelphia Free Library; he reorganized and recreated the University of Pennsylvania; he improved the city water supply; he produced an entire change in the attitude of the public mind of Philadelphia toward education and the ideals of life. To carry out his educational and other plans he raised about $10,000,000. He was himself one of the most liberal givers for these purposes and Professor Thorpe estimates his gifts at a half million of dollars, which he earned in the practice of an exacting profession.

Professor Thorpe divides his treatment of Dr. Pepper's life into three parts: Physician and Medical Writer, Educator, Citizen, in each of which aspects he follows his career chronologically. The story of his youth and ancestry is incorporated in the first part, which deals with him as physician and medical writer. In this part, commencing with his birth, we

* William Pepper, M.D., LL.D. *By Francis Newton Thorpe.* Philadelphia and London: J. B. Lippincott Company, 1904. Pp. 555; 6¼ x 9.

follow his life step by step to 1898, when he died, worn out, at the age of fifty-four. In the second part, "The University," returning to 1862, when he was nineteen, we follow his life on another side to his resignation of the office of provost in 1894 at the age of fifty-one, after he had held office for thirteen years. Incidents and characteristics, which give such a revelation as the book affords of the personal nature of the man, and the account of his closing years, with the struggle against increasing physical infirmities, brought on by excessive work, are included in part three, "The Citizen."

As a physician Dr. Pepper made important contributions to medical science, not by direct discovery, but by the interpretation and application of the discoveries of others. He brought together and made accessible the latest and best results. Outside of his medical writings, Dr. Pepper was the author of numerous articles on education, addresses before learned societies and the like. One address, his presidential address before the first Pan-American Medical Congress, in 1893, seems to have produced so strong an impression on the representatives from Spanish America as to win him a fame in Mexico greater, probably, than that which he enjoyed at home.

Inasmuch as his activities as physician, educator and citizen did not occupy different portions of his career, but were contemporaneous, Professor Thorpe's method of treatment of his subject is artistically faulty. Moreover, his picture is one-sided. It represents only virtues and achievements, and because there are no shadows the portrait is neither so interesting nor so true to nature as it should be. On the other hand, the very faults of the book serve to bring out most strikingly certain salient features of Dr. Pepper's life and character. There is a sense of constant rush and hurry. You seek to become acquainted with the personality of the man behind his ceaseless activities and find an engine, whirring and grinding relentlessly. There is no record of close friendships. He looks on the men and women about him as material to be used for some purpose; and as for himself—he is pushed onward by an irresistible necessity of motion; the fires have been lighted and he cannot stop. Professor Thorpe says that this insatiable need of activity was like a disease. What he achieved was wonderful; but one lays down the book with a feeling that it is not the story of a man, but of a splendid machine.

The Life of Frederic William Farrar. By his Son, Reginald Farrar. New York: T. Y. Crowell & Co. $2.00.

Mr. Reginald Farrar ought, perhaps, to have announced himself as editor of the Life of his Father; for the volume presents something distinctly new in biography. Only part of it has been written by Mr. Farrar. It is a composite work, of which Mr. Farrar is editor; for nearly every one who was long in close contact with the late Dean of Canterbury at any time in his life—at school in the Isle of Man and in London; at Cambridge University; at Marlborough, as an assistant master; at Harrow in the same capacity; again at Marlborough, as Headmaster; at St. Margaret's and at Westminster Abbey, and finally at Canterbury—has contributed to the volume, and Mr. Farrar has done little more than knit together these numerous reminiscences of men and women who were associated with the Dean in his long, busy, and eminently successful life. This is not said in the least as a disparagement of the book. It was a happy idea of Mr. Farrar's to adopt this plan. It saved him much work, and the result is a better biography of Dean Farrar than perhaps could have been produced by the orthodox method, seeing that the biographer was the Dean's son; and, moreover, the plan saved Mr. Farrar from pronouncing some judgments which a son is not usually the best person to form and promulgate. This method of procedure, moreover, has another good result in a biography of a man of such strong character and varied achievements as Dean Farrar. It brings us into close personal relationship with the men and women who were his friends; and in the case of Dean Farrar it is remarkable with how many men who have achieved fame in their own particular work in life he was brought into close contact and active association. The list is too long to be quoted, but it includes

men as far remote from Dean Farrar in the later work of his life, as the late Sir Edwin Arnold, for more than forty years editorial writer on the *Daily Telegraph;* and Mr. George W. Russell, who has been so long of the *Manchester Guardian* staff; and to take two more instances at random, Professor Beesly and Judge Vernon Lushington, who were long Mr. Frederic Harrison's associates in the Positivist movement in London. Several of the contributors to this composite biography express their regret that Dean Farrar was not of the Bishop's Bench in the House of Lords. But there need be no regret that Dean Farrar was not so promoted. He brought Marlborough into front rank among English schools, and if he had gone to Halifax in 1875, when Disraeli offered him one of the richest livings in England, and had thence been called to the Bishop's Bench, it is probable that the restoration of St. Margaret's Westminster and of Canterbury Cathedral might have had to wait for many years; for men of energy and resourcefulness, like Farrar are not too numerous in the Church of England. Farrar did not lack prizes even in the Church, and wherever he went—Marlborough, Harrow, St. Margaret's and Canterbury—he left rich traditions of success. Had he been promoted to the Episcopal bench he might have been put beyond the reach of publishers, who knew the selling value of his name, and might have left undone some book-making, useful perhaps, but that might have been done by men who had not the opportunities of valuable work as were always before Dean Farrar. In this event, Mr. Farrar would have been spared the task of defending some of his father's literary work from the critics.

Fort Amity. By A. T. Quiller-Couch. New York: Charles Scribner's Sons. $1.50.

This story deals with the movement of the British upon French Canada, and opens with the storming of Fort Ticonderoga in 1758. Unlike the average historical novelist, the author considers this period in relation to what has transpired before, and with a long perspective upon the ultimate future. This results in a moderation of literary expression that will seem tame to those readers who have accustomed their imagination to the average blood heated romance of this class. The fact is, Quiller-Couch is not so much a dramatist as he is the painter of dramatic situations. He writes with that air of detachment which belongs primarily to the scholarly and philosophic mind. He regards characters and events as so much literary material to be worked up; and beneath his unimpassioned pen, the fiercest battle becomes merely an admirably drawn picture of the strife. He has no gift for creating the life illusion. Yet few writers surpass him in accuracy and delicacy of literary style.

Man and Superman: A Comedy and a Philosophy. By G. Bernard Shaw. Brentano's. $1.25.

Probably the fantastic genius of Bernard Shaw has never sparkled with greater brilliancy than in his latest play, *Man and Superman,* a modern Don Juan, as he announces it, and only such an interpretation of that hero as that author and no other is capable of creating. Instead of finding the old libertine swaggering about amidst the broken hearts of his helpless adorers, he plays now before us in what the author regards as the true *rôle,* the *rôle* of every man, in fact, who is not a poet or an artist—namely, that of the commonest quarry, hunted down by any woman who hapens to be on the spot and who wants him. And no matter how well he understands and how, when crowded into close quarters, he leaps into his automobile and drives to the wildnesses of the mountains of Spain, he is overtaken easily by the lady and led a piteous captive to the matrimonial sacrifice. It is the new woman no more than it is the old; they have always done this way from the days of the garden, only we have pretended they did not in the romances of literature, because, well—it has been more befitting to masculine dignity to have it so, in the first place, and in the second place the romances were not written in sympathy with the ordinary man, and our hero, after all, is but the ordinary. And yet here is contradiction in the argument, for he is proclaimed from the beginning to be a genius, and

to prove his right to the title is a deadly long dream of the Mozart character in the third act and a characteristically drastic "Revolutionist's Handbook" in the appendix, that he is said to have written before his capture. Its philosophy, however, is as weak as his character, since it advocates the breeding of a new race, the Superman, Nietzsche's Uebermensch, in order to save the world from democracy. But since it is avowed that the chance Superman is never recognized when met with, and since he alone is free from the wiles of women, it is an absurdity to hope for such a race, and once through with this whirlwind of cleverness, we agree with Mr. Shaw in his preface that he knows little more than the rest of us about the matter, but we are glad that we like his play, preface and appendix, all delightfully witty and paradoxical.

Christian Socialism in England. By Arthur V. Woodworth, Ph.D. Imported by Charles Scribner's Sons. $1.00

This is an accurate and detailed account of two movements in the Episcopal Church in England, both inspired by Rev. F. D. Maurice, the first personally, the second through his writings. Of the first movement, which began about 1848 and was helped by Kingsley, Hughes, Ludlow and other stalwarts, much has been written before, and this book says nothing new. Of the second movement, inaugurated by Rev. Stewart Headlam in 1877 and continued more prosperously by the Christian Social Union since 1889, the writer gives a trustworthy account, rather fuller than the small volume of the movement justifies. The title of the book is misleading, tho justified by usage as to the first movement, for all the societies concerned declined to advocate Socialism. "Maurice never questioned the right of private propery so long as the owner realized his social responsibility, and the majority of the members of the Christian Social Union would undoubtedly agree with this to-day." By ignoring all religious socialistic movements outside the Episcopal Church the author shows that scornful spirit of exclusiveness which makes the Nonconformists justly rage. Since the societies he describes were certainly not Socialist and were only narrowly Christian, he would have better justified his title by describing also the Labor Churches and the social work of the Congregationalists, Methodists, Baptists and others. The Labor Churches, started by John Trevor, a Unitarian minister in Manchester, atone for their lack of theological dogma by their greater precision of economic thought. The Congregational Union and others through their Home Missionary Committees insist quite as strongly as the Christian Social Union upon the brotherhood of man, and the works of Rev. Percy Alden at Mansfield House, Canning Town, and of Rev. M. Stead at Browning House, South London, are quite as Christian and as socialistic as the List of Fair Shops, the little circulating libraries, the Sermons in Lent and the other valuable but not world-stirring activities described in this volume.

The Seiners. By J. B. Connolly. New York: Chas. Scribner's Sons. $1.50.

The Seiners is a novel which has caused one reviewer to rate its author with Jack London and Stewart Edward White. It is not equal to that, in spite of the fact that it is a first-rate story of open-air adventure. Its theme is the life of the Gloucester fishermen. The author has seen fit to introduce them and their affairs on shore, and this part of the story drags; but when they have put to sea and are in sight of the mackerel *The Seiners* is as jolly reading as any man could want. It is told with splendid verve, and its characters are alive and its humor delightful. There is a boat race at the end of the season, and we advise no one who cares for boat races to miss the story of the victory of the "able 'Johnnie Duncan' sailin' across the line on her side and her crew sittin' out on the keel."

The Confessions of a Club Woman. By Agnes Surbridge. New York: Doubleday, Page & Co. $1.50.

A novel dedicated to "The average club woman, that product of modern conditions, wherein are commingled all the virtues and some of the faults of her sex." And after careful perusal, we can imagine the fury which will fill the heart of that "average club woman" when she reads the book, which professes to portray her "as she is." It is scarcely

fair to her, whatever her faults may be, to take up a collection of absurdities from all the woman's clubs in the country in order to foist them all upon the Chicago club to which the pretty, ambitious wife of the grocer belonged. The author has industriously gleaned in the wide field of gossip, and we suspect her, like another Ruth, to have been favored with a few stray handfuls of "club stories," which some kindly Boaz has generously let fall in her way. The book resembles a recent novel by Mrs. Marie Van Vorst in its manifest special pleading, and its exaggeration of the dangers of such an innocent plaything as a "literary club" in the hands of the modern Minerva.

Literary Notes

THEISM Under Natural Law, by Edward Softly. New York: Thomas Whittaker, $1.50. This book is not likely to find favor with either theist or atheist. It will neither please the one nor convince the other.

....The Transfigured Sackcloth, by the Rev. W. L. Watkinson. New York: E. P. Dutton & Co,. $1.25. This volume is a series of sermons, and is on a par with the other books by Mr. Watkinson. It is to be commended without reserve.

....Poultney Bigelow has just completed the fourth volume of his "German Struggle for Liberty," and has left Munich for a second cruise down the Danube, in order, as he says, "to pump in some ozone against my winter lecturing in Boston University."

...."The Financial Red Book of America," published by the Financial Directory Association, 25 West Broadway, New York, aims to contain the names and addresses, classified by cities and States, of all men and women in the United States worth over $300,000. We note several errors and omissions, but not more than is inevitable in so difficult a compilation.

....The great interest awakened within the last few years in genealogical research is resulting in the publication of many excellent family histories, and among the best of these, both in form and completeness, is that on the Barclays. This is a volume of 474 large octavo pages, entitled "The Barclays of New York: Who They Are and Who They Are Not, and Some Other Barclays," by R. Burnham Moffat, and published by R. G. Cooke, New York. $5.00. The index of related families will give an interest to others not of the name.

Pebbles

I overheard him say, as he smeared the cat's face with the stuff: 'I'm sorry, Tom, to do this, but I can't have the old folks suspect me.'"—*Smart Set.*

Editorials

The Irish-American Vote

Just as the negro vote has been solidly Republican, so the Irish vote has been solidly Democratic. A Democratic negro has been as rare as a speckled blackbird, and a Republican Irishman about as scarce as snakes in Ireland. Why the negroes should avoid the Democratic Party is plain enough; records, platforms and candidates settle it. But why should not an Irishman be a Republican?

A reason given is that the Irish were compelled to go into the Democratic Party at the time of the "American" "Knownothing" party in the fifties, when a large Irish immigration had been coming into this country. The principles of that secret party, with its lodges, were to shut out the Irish Catholics and put none but native Americans in office. That was the time when a mob burned down a convent in Charleston, Mass., the blackened ruins of which were left as a monument of bigotry. Such was the doctrine of the party, but it was in good measure a policy and a blind on the part of the Free-Soilers who joined it to kill the Whig party, and this they completely did; so that while the Silver-gray, mossback Whigs remained a while as a remnant, and finally joined the Democratic Party, the bulk of them, with all the old Free-soilers, made up the new Republican Party. Thus there being no Whig Party, and the Knownothings like wild fire capturing the States, the Irish were compelled to join the Democratic Party, and there they have remained.

But the War came on when the Republican Party was in power, and the Irish Catholics did grand work in the army, and no one could suspect the Republican Party any longer of hostility to the Irish Catholics. Then when the Plumed Knight, James G. Blaine, was the candidate in 1884, a certain number of the Irish followed his banner, and perhaps more would have done so but for the Burchardism of "Rum, Romanism and Rebellion." The crowding of the Irish in the cities, with their clannishness, has kept them almost wholly in their old party.

And yet there has been some reason why the better and more progressive class of Irishmen should escape the Democratic Party. The rule of Irish Tammany has been a discredit to the race, and some have resented the reputation. It is well known that the most progressive ecclesiastic in the Catholic Church, Archbishop Ireland, is a Republican, and there are Catholic papers which seem to be quite as sympathetic with the same party, but they are such as venture on a certain independence as well as intelligence.

Surprising and interesting in this relation is the present attitude of *The Pilot*, of Boston. That paper is the oldest and most influential organ of Catholic and Irish-American opinion in the United States. Further, it has been edited by laymen and not by priests, while always quite loyal to the Church. Its editors have numbered some of the most distinguished Irish-Americans, including Thomas Darcy Magee, of the Canadian Ministry, and John Boyle O'Reilly; and now it is edited with equal ability by James Jeffrey Roche, the well-known author and poet. The paper has been generally Democratic; but while Republican journals have lost courage on the question of justice and equal privilege for all races in our country, *The Pilot* has maintained a record of real conviction which has been our unfailing admiration.

Now comes the surprise and, we believe, the omen of good. *The Pilot*, for seventy years the unfailing champion of the Democratic Party, gives its present tribute to President Roosevelt. A subscriber asks whether its personal admiration for President Roosevelt is to be placed above the platform and candidate of the Democracy. The editor thus reminds the aforesaid subscriber:

> "Mr. Roosevelt's direct interposition saved a member of 'A Subscriber's' family from being deprived of his livelihood by the proscriptive action of an official who would have discriminated unjustly against a candidate because he was a Catholic."

The Pilot says this act is typical of Mr. Roosevelt's impartiality; that for twenty years he has been in public service, and no man can point to a single act of his, public or private, influenced by prejudice of race or creed or color, "except prejudice in favor of the poor, the oppressed or the despised." It asks its readers to remember past and present history. In Massachusetts a Knownothing Governor insulted them by driving every Irishman out of the militia, and a dozen years later the Democratic machine made that man its leader. It concludes:

"We say: Forgive your enemies, but do not forget them. Pray for them, but do not vote for them.

"We say: Be grateful to your friends, AND DO NOT FORGET THEM.

"That is why people with long memories have a warm place in their hearts for Theodore Roosevelt—no fair-weather friend, no favorer of any class or creed or race, but a just man and a safe one to trust, in storm or calm."

Boston now belongs to Americans of the second and third generation from the Irish of 1853. They elect Mayor and Common Council. Things have changed since Governor Gardner's time. There is a different Irish-American, and not a few of his class will follow Theodore Roosevelt.

Bishop Potter's Saloon

THIS is the argument: the saloon is the poor man's club; therefore let Christianity make the saloon attractive, respectable, Christian. In England a company of men have established public houses with that view, and they have brought the institution to this city, and Bishop Potter is its prophet. One has been started in a populous quarter, and the Bishop and his associates went down to its installation, or perhaps dedication, and gave it their religious blessing. It is to be different from the ordinary saloon in that it will have a churchly color.

We do not expect saloons to be abolished in our big cities for many years. We believe with Bishop Potter that so long as saloons exist it is better to have about them as few of the adjuncts of vice as possible. We respect Bishop Potter's purpose and hope in this new venture of his. We observe that people who know saloons are not a unit in its hopefulness, but we prefer a decent saloon to one that is all vice.

Now what is this sort of semi-religious saloon? A representative of THE INDEPENDENT has visited it. He tells us that it is cleanly and attractive, perhaps no more than many others, but yet an agreeable place to sit down at a table or stand at the bar. On the day he visited it the bar was crowded with visitors drinking all sorts of alcoholic liquors that might be wanted, beer, whisky, gin, brandy—all of them, and all presumably of what is called good quality—that is, full strength, not diluted with water. At the tables one could get a full pint of beer for five cents, more than would usually be had at a saloon. There were soft drinks, not much called for. Then the lunch was excellent, two thick slices of bread making a sandwich of various meats, as good as at Delmonico's, and for five cents, a comfortably sufficient lunch. This was the room for the men, airy and pleasant.

There was also a room for the women, for they were not allowed in this barroom. In their room there was only a full supply of soda water and such soft drinks, and beer in plenty. Just why women should not be allowed the same privileges of the stronger drinks that men may have is not clear.

We make no more particular objection against Bishop Potter's style of saloon than against any other; indeed, it is probably a better sort. The chief advantage we see to it is that it is promised that only five per cent. profit, which is itself an excellent profit, shall be given to the society that invests it, and that all further profits shall go to establish other similar saloons. There may be, then, a certain advantage in the assurance that the barkeepers will not try hard to persuade patrons to booze. But we suppose there is need for very little of that, anyway. There is no rule against treating, and, indeed, no restriction not found in any well managed saloon. Drunken people are not allowed to remain, and we suppose that if women are invited, children are not. And yet our representative saw four boys less than fourteen years old supplied with liquor.

We see no hopeful advantage in this saloon. It is about on a par with others

of the better class run for profit. It is no better club than others, and these are as good as the patrons want. It is desirable that saloons shall be clean, quiet and free from immorality. But more and more communities are finding that what they want is fewer rather than more saloons. Cities will long demand them, but local option is shutting them out of very large sections of the country. We are not sorry that Bishop Potter should try his experiment, but we do not see any probability that it will prove a permanent moral force in the community. The best club is the home club. Well trained men choose it.

Justice Brewer's Suggested Constitutional Amendment

JUSTICE BREWER must have very strong convictions on the importance of protecting in every way the independence of the judiciary, or he would not have suggested in the article which we print this week that it would be well if a constitutional amendment should forbid the transfer of judges to political life. He is speaking of the indisposition of the American people to transfer one from judicial to political life, and he says:

"It is encouraging that this disposition is growing. I firmly believe in its wisdom, and should not regret even constitutional amendments forbidding any such transfer. I know there have been conspicuous instances in the past, and may be in the future, in which the selection of a judge for political life was wise, justified by the character and fitness of the man; but as a general rule one accepting judicial office should be impressed by the conviction that thereby his political life is ended, and that the possibility of distinction and success lies wholly in his devotion to judicial service and the character of the work he does therein. Over the judicial door should be written in fadeless letters: Who enters here leaves all political hopes behind."

This is a very suggestive utterance. When these words were written Justice Brewer knew that the Democratic nomination for the Presidency was likely to go, or had already gone, to the Chief Justice of the highest court in the most populous State in the Union. It is impossible that he did not have the nomination of Judge Parker in mind, either as an act to be condemned, or as one of the rare exceptions that have not proved unfortunate to a rule which ought nevertheless to be absolute. We do not in the slightest question—and we are sure Justice Brewer does not—the perfect integrity of Judge Parker; and yet it is clear that in such a case Justice Brewer would not have thought it consistent with his own sense of the importance of maintaining judicial independence that he should himself either consider or accept such a nomination. He would have the door to political aspirations absolutely closed by a constitutional amendment, fearing that some taint of suspicion might otherwise attach to decisions having a political bearing.

Justice Brewer's rule is a right one, whatever may be the exceptions. But it is a rule difficult to maintain where the judiciary is elective, and nearly impossible where judges of lower courts are elected for a short term. In such States as New York or Pennsylvania, where judges of higher courts are elected for a term of fourteen or twenty years, the very length of the term practically takes them out of politics and removes the major part of the temptation for them to have a re-election in mind when rendering decisions that have a political side.

But the danger of a judge tampering with his conscience in hopes of re-election or of appointment to a higher judicial position is not what Justice Brewer has in mind. That danger cannot be prevented so long as judges are human and are elected by popular vote. What he would guard against is the chance that judges' opinions may be warped by a desire to secure some high legislative or executive position. A judge may want to be a United States Senator, a Governor or a President. There may come before him a case that concerns a strike or affects a popular labor union or an unpopular corporation, and the judge may know that a decision one way will please capitalists or will displease an army of laboring votes. Being a man and not an angel, he may be influenced by his hopes of a more lucrative or more distinguished office to give a decision in the way his interests lie, and may do this almost unconsciously. It is easy for one to deceive himself. Every man has handy

an opiate for his conscience if he will look for it. A few such cases in which personal interest stains the judicial ermine might destroy the reverence of the people for our courts, which are, and should remain, the bulwark of our free institutions.

In what we say we would not definitely condemn Judge Parker for allowing his candidacy and accepting his nomination. We simply say that, as a rule, it is not safe for judges to have an eye out for politics, in search of office by vote of the people. Judge Parker may be all right, but there are a multitude of other judges, some of whom are not as firm as he in their principles. We have had cases of late in Alaska, Montana and in Florida in which judges have been deemed not to hold the scales of justice quite true. We wish that his backers had been more sensitive to the proprieties and had not put Judge Parker in a position which he cannot well defend.

The Wedding of Two Sciences

TWENTY-ONE years ago a candidate for the doctor's degree at the University of Upsala presented in his thesis the results of an investigation which could not conveniently be placed in any of the pigeonholes by which we classify knowledge. The chemical faculty refused to accept it on the ground that it was work in physics; the physicists rejected it for the reason that it was chemical. As a result of this disagreement one of the most original pieces of research work ever presented to a university was finally passed with the mild commendation "*non sine laude*," "not without praise."

The theory of electrolytic dissociation which the young Arrhenius embodied in this dissertation was in fact a foundation stone of a new science, which since then is being rapidly built up to fill the gap between chemistry and physics. Chemists and physicists had worked largely independent of each other, using different methods and speaking different languages. Now the chemists have been obliged to study higher mathematics and the physicists, who formerly disdained to consider anything smaller than the molecule, are talking of particles a thousand times smaller than the atom.

This marriage of the two sciences, of which Professor Arrhenius was one of the officiating clergymen, has already resulted in numerous and promising offspring. The use of electrical conceptions for the interpretation of chemical facts has thrown light on many well known and formerly inexplicable processes, and has also served as a guide to the investigation of new phenomena, such as radioactivity. The earliest substances prepared by the alchemists were acids, alkalies and salts, and it might be assumed that since they had been longest studied they would have been most thoroughly understood. The contrary was, however, the case. There was nothing more mysterious in chemistry than what occurs when salt is dissolved in water.

As an example of the confusion, we may consider one of the commonest of chemical analyses, that of a mineral water. If the same mineral water or solution of salts were given to two chemists they might bring in very different reports. One chemist might report, for instance, that the water contained sodium sulphate and potassium chloride, and the other might say it contained potassium sulphate and sodium chloride; two very different compounds. The reason of this apparent contradiction was that the four parts of the substances in solution, the potassium and sodium parts (positive ions) and the sulphate and chloride parts (negative ions) were determined separately, and chemists were in dispute as to how they were paired off in the water. The electrolytic theory of solution settles the question by showing that both sides were right, or, if you please, neither was right, for it is proved that while in solution in the water the positive and negative halves of the salts are not joined together at all for the most part, and it depends merely on the mode of evaporation which salts are left when the water is taken off.

As Professor Arrhenius explains on page 321 of this issue, the reason why a solution of a salt conducts electricity, while pure water or a solution of sugar does not, is because the salt is separated into positive and negative parts, called ions. But flames and metals also conduct electricity, therefore matter in a hot or metallic state contains ions. But air under the influence of the Röntgen or

x-rays becomes a conductor, so it, too, must be ionized. Certain minerals were found which gave off similar rays; these were found to consist in part of minute corpuscles charged with electricity, or, as some are beginning to say, corpuscles of electricity. And now the electrical theory in further development is proffering us explanations of the constitution of matter, and of phenomena of gravitation and inertia. The mystery of chemical valence, or the elective affinity of the atoms, seems to be yielding to the same master key. Catalysis, now beginning to be understood, is put to commercial use, as in the new process for the manufacture of sulphuric acid, and earns its millions each year. Professor Mathews gives us an electrical theory of the transmission of sensation by nerves. Professor Loeb substitutes osmotic pressure for the male factor in the fertilization of starfishes. We read of poisoning of platinum by arsenic, and of the bad influence on metals of stimulants and narcotics, such as chloroform, alcohol and strychnine. On the other hand, we hear of rays, some of them attracted by magnets or gravitation, given off by the contracting muscle and the thinking brain.

The artificial distinctions between the sciences, even between the biological and physical, are vanishing. Modern science, like Napoleon, is an eradicator of boundaries. The long standing deadlock between the physicists and the geologists as to the age of the earth is broken by new theories of the sun's heat, and the expectation of life of the solar system is extended far beyond the limits set by the previous calculations of cosmical actuaries.

In many of the lines of investigation here mentioned Professor Arrhenius had had a part. Not more by his experimental skill than by the originality of his suggestions and the daring sweep of his imagination he is having an important influence in the recent unprecedented advance of science. As the *Popular Science Monthly* says:

"In Arrhenius we have a man who has received the Nobel prize before he was forty-five, and whose scientific work ranges from salt solutions to comets and from glacial periods to the typhoid bacillus. Such a record lends little support to the belief that a scientific man must be a narrow specialist if he is to attain eminence."

On the Making of Crimes

Of the making of many crimes there is no end. The making of crime is a pursuit to be distinguished from the committing of crime. Society collectively, and through the authority of the state, makes crime by enacting that certain acts or negligences shall be known and stigmatized as criminal and punished by certain penalties. Individuals commit crime by becoming guilty of the acts or negligences so stigmatized and punished.

A certain fondness of civilized communities for making crimes has seriously impaired the scientific value of criminal statistics. When it appears from official reports that crime is increasing or decreasing we cannot always be sure that the moral habits of the population are deteriorating or improving. Crime may be increasing rapidly when a people is becoming better behaved. Acts that a few years or a generation before were looked upon as innocent may have been made criminal.

There is a large class of well-meaning persons in every community who think that a short cut to the millennium is through the making of crime. Whatever they don't happen to like they wish to penalize. Their dearest wish is to make everybody else think and behave as they do, so that all may live together like a happy family, in a "perfectly lovely" world.

There are other men and women, not quite so sanguine or so zealous, who yet think that we ought to enlarge the category of crime and be strenuous in enforcing the criminal law. A remarkably interesting article by a serious minded writer of this class is contributed to the *Atlantic Monthly* of August, under the title "Unpunished Commercial Crime." It is a graphic account of the shameful prevalence of fraud, adulteration, bribery and graft in American business, and a plea for a vigorous enforcement of the criminal law against these forms of wickedness. It proposes a remedy for a great evil which thousands of minds will seize upon as obvious and necessary. Yet it is fallacious and dangerous, and its

mischievous philosophy cannot be too promptly or too plainly exposed.

Perhaps it is true, as Mr. George W. Alger, the writer of the article in question, assumes, that fraud in its modern forms is a more serious menace to the social order than are the elementary crimes of violence characteristic of primitive communities; and perhaps it is so dangerous because it is "highly contagious"—a "moral epidemic." But to admit so much is not by any means to answer affirmatively the question-begging question, "Should not the criminal courts perform the functions of health boards in preserving the community from moral epidemics?"

Physical contagion and moral contagion are two different things. Against physical contagion the conscious will, the moral sturdiness of the innocent party "exposed" do not avail. Moral epidemics spread only through the conscious and guilty participation of infected and imitative minds. When a smallpox patient runs amuck, those whom he jostles on the street are not his accomplices. When janitors and seamstresses and country elders buy the worthless shares of salted gold mines that offer a 25 per cent. dividend the first year, they do it because, like faro dealers and other gamblers, they expect to get something for nothing; and from the beginning of time the man and woman that have tried to get through life on a something for nothing basis have been *participes criminis* in all the rascality that has been "doing."

There are two all-sufficient reasons why criminal prosecution is not the expedient remedy for every patent or ingenious manifestation of fraud. The first is that the mass of mankind must learn by experience to look out for itself. A community actually and effectively protected by the criminal law against all manner of frauds would be a community of feeble-minded.

The second reason is that the true and effective penalty for fraud, so far from being that which the criminal courts can inflict by way of fine or imprisonment, is that which individuals should be able to inflict incidentally while looking after their own interests. The fraudulent promoter, the bogus advertiser, the trade-mark thief, should be unable to escape the payment of damages awarded at civil law, except by remaining the rest of his life too poor to pay them. Damages are evaded to-day by conveyances of property, by bankruptcy, and by advantage taken of the corporate form of organization. A verdict for damages where fraud has been proven should stand against the defendant for life or until paid, a first lien on prosperity subsequent to bankruptcy. It should stand against each of the individual officers and directors of a corporation as well as against the corporation.

Civilization is as yet far from going in the best way about its business of civilizing men. There is too much reliance on crime-making, and far too little effort to provide for injured parties that swift and sure redress of their wrongs which, in all ages, has been the most effective restraint upon wrongdoers and the most practical kind of justice.

For Competitors Abroad

In a statement concerning the work of the Merchant Marine Commission, Chairman Gallinger says the testimony everywhere has been that "it costs from 30 to 60 per cent. more to build ships in this country than abroad." The Commission is now on the Pacific Coast. At Seattle, the agent of an American company, whose steamships are in competition on the Pacific with those of the Canadian Pacific Railway Company and other foreign corporations, testified that the boats of these foreign lines were built in Great Britain. "The average cost of them," he added, "was at least 40 per cent. less than if they had been built in the United States." Others have asserted that the cost of construction is greater by at least 25 per cent. in this country than in foreign shipyards.

An important element in the cost of making such ships is the price paid for the steel used in the hull and other parts of the vessel.

American manufacturers of steel plates for ships are selling them to the English shipbuilders at only a little more than half the price which they compel our own shipbuilders to pay.

Testifying before the Commission in Cleveland, Vice-President Wallace, of the

American Shipbuilding Company, said he had been told by an agent of the United States Steel Corporation that the Corporation was selling to shipbuilders at Belfast, for $24 per ton, delivered, steel ship plates for which the price in this country at the mills in Pennsylvania was $32. Since he testified, the export price of such plates appears to have declined. The following may be found in the trade reports of the New York *Journal of Commerce*, on the 30th ult.:

"One of the most interesting features of the steel situation is an important sale of several thousand tons of steel plates for export, the price of £5, delivered at Newcastle-on-the-Tyne, netting the mills about 90 cents per hundred f.o.b. Pittsburg. It should be remembered that sales are made in the English market by the gross ton; allowing $3.50 freight rate and a slight allowance for insurance, this price would net the mills $20 per gross, or $18 per net ton, or 90 cents per hundred, against $1.60 per hundred for domestic business."

For these plates, delivered, the English shipbuilder is paying something less than $22 per net ton, and the manufacturer is receiving $18, at Pittsburg, where American shipbuilders are required to pay $32. The price for such plates, delivered at New York, for home consumption, is about $36.

Thus, if the cost of construction depended entirely upon the cost of the steel, it would be greater by 63 per cent. in a New York yard than on the Tyne, provided that both builders used American steel plates at current prices. Which is quite interesting.

It may be that those steamships of the Canadian Pacific Railway Company, of which Agent Waterhouse spoke to the Commission at Seattle, steamships constructed in British yards at a cost "at least 40 per cent. less than if they had been built in the United States," were made of exported American steel delivered at the British yard for $22, when the price at an American yard was not less than $36. It may be that the competition of the Canadian Pacific Railway Company with American ships was promoted in this way, as its competition with American railways has been promoted by the sale to it of many thousands of tons of American rails for $21¼ per ton, delivered at Montreal, altho parallel railways on this side of the boundary were required to pay $28, taking the goods at Pittsburg.

We have sometimes thought that it must be difficult for the gentlemen who control the policy of the selling companies to reconcile with their patriotism, and also with their interest in American shipping, these sales of material to competing foreign shipbuilders and steamship companies and railways. For example, when we look at the list of the great Steel Corporation's directors we see there the name of Mr. Clement A. Griscom, owner of steamship lines, president of the International Navigation Company, and a director of the Cramp Shipbuilding Company. Is there any one more familiar with the argument that subsidies are needed because, for one reason, the cost of making ships is less in foreign yards than in our own? It has seemed to us that every report of a sale of ship plates by the Steel Corporation to a British shipbuilder, at a price less by 30 or 40 per cent. than the price that American shipbuilders are required to pay, must wring Mr. Griscom's heart.

And there are other directors—among them Mr. Morgan, Mr. Rockefeller, Mr. Rogers, Mr. Schwab, Mr. Frick and Mr. Marshall Field,—some of them directly and largely interested in ocean shipping, and all supporters of the policy of protection for American industry and enterprise, a policy with which this discrimination in favor of foreigners appears to be sharply at variance. Some, perhaps all, of them have supported the appeal to Congress for subsidies, and have approved the use of the argument that help was needed to enable our shipbuilders and steamship companies to overcome the lower cost of construction in foreign yards. Why is it that they give aid and comfort to the foreign yards by selling steel to them at $22, while they make our own shipbuilders pay $36 for it? Why do they give these foreign builders such an advantage over their fellow countrymen in the same industry at home? We frankly admit that we cannot answer these questions. Bearing in mind the patriotism and Americanism of these gentlemen, we should think that they would prefer to discriminate in favor of their own people.

The United Free Church of Scotland

"THINGS have been happening" during the past week which we are free to say gave us either a great shock or a sense of the ridiculous so prodigious that we have not yet seen the whole of the joke. Have the Lords been on a lark?

It seems that the court of final appeal in Great Britain has decided that when more than 1,100 ministers and nearly 300,000 communicants of the Free Church of Scotland agreed to coalesce with the United Presbyterian Church they contravened some principle or did something to the "Fundamentals."

This union was effected between the two great bodies of Presbyterians in October, 1900, and was opposed by less than thirty ministers and the communicants of as many churches, chiefly in the scattered parishes of the Highlands. These few dissentients have carried their case from court to court to be defeated in every appeal, until they came to the highest court—the House of Lords—which reversed all other decisions and gave these two dozen men a right to call themselves the Free Church of Scotland, and also gave them control over the Church's property as it existed in 1900, to the value of about $20,000,000.

One or two historic facts may account for the present condition of things, and perhaps may suggest a remedy. At the time of the union in 1900 a writer in *Blackwood's Magazine* said that "the great mass of the laity of the Free Church has never been enthusiastic in the cause" of union. He affirmed that both "stolid indifference and dogged opposition had to be overcome," and that the end was not attained "without wheedling here and bullying there, that need not be detailed." At the same time *The Spectator* drew attention to the fact that the United Presbyterian Church, which took definite shape in 1847, was made up of different bodies which had seceded at different times on slightly different grounds, but that one broad principle actuated them all—namely, "Voluntaryism"—self-supporting churches, voluntary contributions for all purposes, and total independence of the secular government.

On the other hand, the great Disruption of 1843, which called into being the Free Church of Scotland, led by Dr. Chalmers and nearly 500 other ministers with their congregations, was based entirely on other grounds. A Church established and endowed was not condemned nor regarded as undesirable. The things condemned were the tendencies to Erastianism in the Church, the interference of the civil power in affairs which they regarded as spiritual and matters of conscience, and the attempt of the magistrate to dictate to the Church in questions of government and administration. These things were found intolerable, and they led to one of the most remarkable religious movements of the last or any other century.

The Free Church was modeled in some respects after the Established Church in Scotland, and the ministers and members felt the necessity of providing a substitute for the support which the Established Church gave; and hence, as *The Spectator* says, "came the splendid scheme of the Sustentation Fund, which was to provide a substitute for the support which the Establishment had given."

Now it seems that the House of Lords must have imagined that this principle was relinquished when in 1900 the Free Church was united to a Church to which Voluntaryism is as the breath of life. But whether this is so, or not, it seems to us that a remedy is found for the present condition of things in the very enactments of the Free Church law of 1887. By the authority of the General Assembly in 1887, among the "Important Documents" concerning the Practice of the Free Church of Scotland, we find the following:

> "That the property of each place of worship be vested in trustees chosen by the congregation to be held for the congregation in communion with the Free Church as attested to be so by the Moderator and Clerk of the General Assembly." . . .
>
> "That in the event of a certain proportion of the ministers and elders—members of the church courts—separating from the general body and claiming still to be the true *bona fide* representatives of the original protesters of 1843, and to be carrying out the objects of the Protest more faithfully than the majority; then, whatever the Courts of Law may deter-

mine as to which of the contending parties is to be held to be the Free Church, it shall be competent for each congregation by a majority of its members in full communion, to decide that question for itself, so far as the possession and use of their place of worship and other property are concerned, with or without compensation to the minority; such compensation to be settled by arbitration."

Surely if this law of the Church is to apply to a minority, it should apply with greater force to what is practically the whole body of the Church; that is, supposing that its ministers and communicants have really separated themselves from the Free Church, we think it might also apply to the few dissentients who have raised such a storm that we are told "all Scotland is stirred."

If the Free Church by its action in 1900 did in any way depart from the traditions of 1843, and followed the general trend of religious thought, it has proved itself capable of providing virile men for its ministry and professorships; and during the last sixty years it has brought forth the strongest and the best men in the Presbyterian Church. We sincerely trust that religious matters in Scotland will be left henceforth for the Scotch to deal with, for assuredly they understand them best. Whatever may be the law, the Lords have done great injustice.

The Dilatory Turk

Very likely the Turkish Government thought it was not honor but money the Yankee nation wanted in the way of demands, and so Turkey managed two years ago to pay the less than $100,000 due for losses of buildings burned by Turkish soldiers at Harpût, saving their face by adding the sum to what was due to the Cramps for a war vessel. Also they yielded the medical examination of students at Beirût. But the chief demands were never allowed—namely, the same privileges of American citizens establishing schools that were allowed to the English, French, German and Russians. It is not right or dignified that Americans cannot get the same rights in Turkey that other people can get, and our Government means at last to see why. For years the Turkish Government has delayed and refused until patience has ceased to be a virtue. It is now reported that we will send a squadron to Smyrna by way of a hint that we do not want to be forgotten, and that Turkey should consider the duty of acting like a civilized Power. Mr. Leishman, our Minister, is refused satisfactory audience on all excuses year after year, and now, when it is granted, further delay is made. There must be diplomatic pressure of some effective sort.

Georgia Repudiation

Georgia is one of the States that have repudiated their bonds. For this reason Georgia bonds are not listed on the New York Stock Exchange. Is it not about time for the State of Georgia, rich and strong, to remove that stigma from itself? It was not financial inability, but political prejudice, that was the occasion of the repudiation. As ex-Governor Bullock says in a recent letter to the Atlanta *Constitution*, the bonds were authorized by the Legislature of 1868-70. For them the State received a good and valid consideration. The railroads built with them are in operation to-day. Those railroads opened the great belt of Southeast Georgia, before that time returned as wild land, now teeming with population and productive industry. The State is collecting in taxes on what were then "wild lands," and on the roads themselves, more than money enough to pay the interest on the liability which she repudiates. The State held, under the Constitution of 1868, a first lien on all this railroad property and was absolutely protected. It is thirty-five years since this honest debt was repudiated by a malignant partisan hate which did not stop at the disgrace of the State. It is 27 years since Georgia adopted a new constitution which expressly forbids her courts ever to hear or determine the legality of those obligations. It will require a constitutional amendment to correct that wrong, but by this time the people of Georgia ought to be able to give serious thought to this matter and to take steps to do what is not political but financial justice.

Tibet At last the British are in Lhasa, and will stay there until the Tibetans are ready to make a treaty of commerce. Just how far the expedition had a purely diplomatic purpose, to straighten out a treaty, and how far it was intended enhance British control in Tibet as against the advance of Russia, is not clear. On this matter the wisest differ. It cannot be denied that Lord Curzon has done much to advance British prestige in the countries about. He has established British influence in the Persian Gulf and Arabia; he has extended the territory of Aden, and the British are predominant in Muscat. In Afghanistan the British again possess an influence superior to that of Russia, and a telegraph line from Persia to Calcutta is to pass through Afghanistan. Now the British control will be supreme in Tibet, and very likely a British Resident will be stationed, with a suitable guard, in Lhasa. But this must be said on the other side, that Lord Curzon has not the affection of his Indian subjects. The great and expensive Durbar left heart burnings in many rajah courts, and the more intelligent natives are beginning to complain that nothing is done to enlarge the governmental sphere of the people themselves. They ask whether always the Hindus are to be a subject people, and they are studying the capacities of other Asiatic people, the Japanese and the Filipinos.

Danish and Norwegian Our English Bible became so the standard that the English language has become one single thing the whole world over, on all continents and islands. The Bible made one language out of what was a variety of dialects. The same was done for the German language by Luther's Version, and yet a reverse situation occurs in some other countries. as, for example, in Scandinavia. Several revised versions have been made during the last century in Norway, and now the revised Version of the New Testament has been received within a few months with general satisfaction by laymen and clergy, and the Version was necessary because the Danish used in Norway, which is sometimes called the "Norwegian," has developed more and more away from the mother tongue, both in lexicon and grammar. The Dano-Norwegian is so distinct from Danish proper that the whole Version of the Bible has acquired a markedly unnational as well as archaic coloring in Norway. The present great undertaking of the complete Version of the Bible, which began over half a century ago, may now be regarded as marking a period in the development of the national and religious life of Norway, and also of its language. It seems unfortunate, however, that the three countries of Scandinavia cannot manage to have and maintain one and the same language.

The British Parliament meets in Westminster Palace. The House of Lords has been discussing the incomplete decorations. The scheme of the original decoration was architectural, and it was then changed to paintings and mosaics, but this was suspended long ago. Two niches for statues of Marlborough and Wellington have been vacant for forty years. Great panels for pictures incased in elaborate stone are covered with dirty red flock paper. When this was complained of the paper was changed for green, simply clean. There is a chimney-piece in the central hall half concealed by a refreshment bar covered with sandwiches and ginger beer. A staircase, once called the Hall of Poets, has the word "Shakespeare" in large gold letters over a sheet of red paper. Under these sheets are entombed frescoes that once adorned the wall, but they have perished, altho they might be restored. Only one of the frescoes in the Poets' Hall survives, and in front of that has been erected a telephone-box. "They order this matter better in France," said Laurence Sterne.

Chinese geographical names, which seem to us so barbarous, are not so meaningless as they appear. Thus *ling* means a pass; so Motien-ling is the sky-scraper pass; Ta-ling, the great pass. *River* is *ho* in North China, and *kiang* in South China; thus Liao-ho, distant river. *Chiao* is a *bridge;* thus the locality of a great contest is Tashi-chiao, the great

stone bridge. *Hai* is the *sea*, as in Haicheng, where *cheng* means *castle* or *city*, the city of the sea, altho the city is now thirty miles inland. *Wan* is bay, as in Ta-lien wan, where *ta* means *great*, and *lien extended*, thus the greatly extended bay. *Tien* is a *shop* or *inn*, as in Laozetien, the gentleman's inn. One may, however, easily mistake the meaning of a name. Thus Kolien-sheng simply reproduces the name of Admiral Colinson, after whom the cape is named.

We said that it would be better if the Catholic Church had only a dozen theological seminaries, instead of 75. We are told by *The Pilot* that there are only 71, with an average of 57 students each. We venture to say that 71 is 59 too many. Each seminary ought to have not less than five profesors of theological studies, besides teachers of preparatory studies; and we do not believe there are in the Church 375 competent professors of Church history, dogmatics, morals, casuistry and Scripture. Our intelligent and exact contemporary tells us that there are 179 Catholic colleges for boys, not 197. We will not dispute the 18 difference. We wish most of them had been named academies.

It is something more than amusing that the official "Directory of Officers of the United States Army, Navy and Marine Corps, officials of the civil government and foreign consuls in the city of Manila and suburbs," published by the Adjutant-General, should have led the list of "Diplomatic and Consular Representatives" with the names of Archbishop Harty and Apostolic Delegate Guidi, followed by the names of their secretaries, after which come the consuls. They are not consuls; they represent no foreign power. It is a reprehensible survival of the ideas of the Spanish rule to put them there. Archbishop Harty is no foreigner; he is an American. We would not have his Church thought of as foreign.

A memorial to Jacob Abbott, of "Rolla Books," "Jonas Books," "Lucy Books," "Young Christian" fame, is projected in the way of the purchase and preservation of his residence in Farmington, Maine, where he long had a school for boys, and also one in Boston. There must be some of the old pupils of this boys' philosopher living who will be glad to help this memorial through his son, the Rev. Edward Abbott, D.D., of Cambridge.

We like the dignified "Declaration" of the bishops of the African M. E. Church that their Ethiopian mission work in South Africa has no political object, but solely a religious one. It is addressed to a suspicious Government and people, promises loyalty and obedience to Government, with no politics, and solely civilization, education and Christianization. We have been sorry to see the hostility of good men who ought to have a more charitable view.

We remember an admirable sermon on law and order preached several years ago in Greenville, Miss., by an Episcopal clergyman, the Rev. Quincy Ewing. He is now in a church in Birmingham, Ala., and in a discourse lately he made the extraordinary statement that more men are slaughtered in Jefferson County, Ala., in one year than in all Great Britain, with its forty million people, and no punishment for the murderers. Is that a test of comparative civilization?

Kipling's last poem, "Things and the Man," might be more easily understandable of the common people if the poet had not handicapped himself with the task of repeating the same three rhyming syllables in all the five eight-line verses. It needs interpreting, but it suggests that Mr. Kipling is not likely to be in sympathy with the next Parliament.

Panama does not propose to waste the ten millions which the Republic has received from the United States, nor to have a debt. She has put six millions in mortgages in this city, and has money to lend. A new nation has new ways. But how about her share of the Colombian debt?

Financial

Cotton and the Weevil

A RECORD-BREAKING crop of cotton is foreshadowed by the latest report of the Department of Agriculture. At the end of last month the average condition of the growing plant was 91.6, against an annual average of 82.7 for the ten years preceding. As there is an increase of acreage, an estimate of 12,000,000 bales appears to be warranted by the situation. Up to this time, the largest commercial crop has been about 11,200,000 bales. The value of last year's crop exceeded $525,000,000.

Dr. O. F. Cook, of the Agricultural Department, who discovered the Guatemalan ant that kills boll-weevils, has made an interesting report concerning his experiments at Victoria, Tex., with this insect, which, it is hoped, will check the weevils' ravages in the cotton fields. A loss of $20,000,000 worth of cotton last year, on account of the weevils' activity, has stimulated inquiry for a remedy. Dr. Cook brought up from Guatemala about 4,000 ants, in 89 colonies. He finds that they burrow from one to three feet into the ground, making passageways one-quarter of an inch in diameter, and chambers about three-fourths of an inch high. In addition to the chambers inhabited by them there is one in which the hard parts (heads, legs, wings and other fragments) of slaughtered weevils and other insects are packed away. It remains to be seen whether they will survive the floods to which much of the level cotton land of Texas is subject. These ants know how to sting the weevils at the only points where their armor is vulnerable. They are long-lived insects; an ant queen has been known to live for fifteen years, and a worker for six. Dr. Cook summarizes the results of his investigation by saying that this ant does attack and kill the boll-weevils, and thus "permits the regular harvesting of a crop of cotton even under conditions favorable to the weevil;" that it is carnivorous and predaceous; that it injures no form of vegetation and takes from the cotton plant nothing except the nectar secreted on the leaves and floral envelopes; that its habits and temperament are such that it is "readily capable of domestication, transportation and colonization in the cotton fields of Texas." He does not yet know whether it will survive the winter climate of the State.

A TESTIMONIAL has recently been presented to John M. Holcombe, Vice-President of the Phœnix Mutual Life Insurance Company, to mark the thirtieth anniversary of his service with the company.

....Redmond & Co. and J. & W. Seligman & Co. offer to investors, at 97½ and interest, $1,500,000 of the first and refunding mortgage 4½ per cent. sinking fund guaranteed gold bonds of the Connecticut Railway & Lighting Company, due in 1951 and redeemable at 105 and accrued interest. The company owns 175 miles of electric road in thickly settled parts of the State. Interest is guaranteed by the United Gas Improvement Company, of Philadelphia.

....The will of George H. Laflin, a Chicago pioneer, provides for the distribution of $2,000,000 and contains the following advice to his heirs:

"I would advise all my children to be prudent in their investments, and not to purchase anything simply because it is cheap, but to remember that a long-time security, drawing a low rate of interest, is often more desirable than an investment which draws a high rate of interest. I would also advise them not to purchase anything which they cannot pay for in full at the time of the purchase, as more men are ruined by speculation than in any other way. I also advise them not to sign any note or bond, and to look well to all transfers of real estate, and not to incumber any real estate, except for the purpose of improving same."

....Dividends announced:

Amer. Chicle Co., Common, 1 per cent., payable August 20th.

Union Pac. R.R., Preferred, $2.00 per share, payable October 1st.

Union Pac. R.R., Common, $2.00 per share, payable October 1st.

Niles-Bement-Pond Co., Preferred, 1½ per cent., payable August 15th.

Niles-Bement-Pond Co., Common, 1½ per cent., payable September 15th.

Niles-Bement-Pond Co., Common, 1½ per cent., payable December 15th.

Insurance

Some Spanish Insurance Companies in the United States

English offices are by no means the only foreign insurance companies to compete with domestic concerns for fire, life and marine business in this country. We have had French, German and Russian companies for some time, but more recently, according to *The London Review*, several Spanish companies have entered the field. Repressive legislation has operated to discourage many foreign companies, but the best of them survive both harassing legislation and burdensome taxation.

The Spanish companies are not so generally known as are some of the other European companies, but some of them deserve more general recognition. Possibly the best known Spanish company now operating in the United States is La Estrella. This company was founded in Cartagena under very powerful auspices. The shareholders were to a considerable extent shareholders in the Bank of Cartagena, which bank, under the circumstances, naturally became the company's bankers. La Estrella, altho a young company, had a great reputation in Cartagena and did a large marine and fire business, but its life business was moderate. The company, it is reported from London, has been prudently conducted. The marine business done has been entirely satisfactory, but, in view of the large present year conflagrations in the United States, its fire business has not been quite so profitable. The company is, however, not worse off in this respect than are many equally respectable offices that have lately hazarded their fortunes in the American field. The head office of La Estrella was lately removed from Cartagena to Madrid.

Another Spanish company doing United States business is La Polar. This company has, perhaps, spent money somewhat extravagantly in its life branch in an effort to obtain business. La Polar has the assistance of the Bank of Bilbao in its attempt at recovery.

Another Spanish company operating here is the Union & Fenix Español. This is an old joint stock company which has been established for more than 30 years. Its reputation is excellent, especially as a fire company. It is prompt and punctual in the settlement of its losses. The concern has only just begun doing a life business, in which it has not yet displayed any particular energy.

There are about twenty offices in Spain doing a life business, among which number there are some "wildcats." The Union & Fenix Español, however, is not among this ferocious breed, but is an eminently respectable company. The company's recent balance sheet shows a total of some 14½ million pesetas, a peseta being worth a little less than twenty cents.

The total funds of the Union & Fenix Español are nearly 15 million pesetas, excluding, it would appear, the property of the concern in Paris, valued at 7 million pesetas. The Union & Fenix Español during its 30 years' experience has paid nearly 100 million pesetas in losses, roughly equal to about $20,000,000.

The colt "Highball," who broke the cannon bone of his leg at the Brighton Beach track last month, was insured by his owners with Messrs. Lloyd, of London, England, for $25,000.

....The University of Michigan, which began a summer school at Ann Arbor on June 27th, has just closed. A feature of the program was Professor Glover's course in "The Theory of Annuities and Insurance."

....During the past year the Provident Savings Life Assurance Society wrote assurance amounting to $42,000,000, and there was an increase in payments to policy holders as well as in income, assets and surplus. Under the presidency of Edward W. Scott the progress of the Provident Savings Life Assurance Society has been notable, and the officers of the company report a most gratifying progress during the six months ending July 1st. The assets are $7,310,138. The reserve fund and all other liabilities amount to $6,279,139, leaving a net surplus of $1,030,999.

Vol. LVII NEW YORK, THURSDAY, AUGUST 18, 1904 No. 2907

Survey of the World

Judge Parker's Speech of Acceptance

Formal notification of his nomination was given to Judge Parker on the 10th inst. at his home in Esopus. The address of Mr. Champ Clark, chairman of the Notification Committee, contained no passages of partisan political significance, except the assertion that the St. Louis convention had "carried out no cut and dried program," and that "its delegates were not mere automations or marinettes moving and talking when the strings were pulled by one man." At the beginning of his response, Judge Parker spoke of his memorable telegram, sent because, he said, "I felt it incumbent upon me to make known my attitude so that hereafter no man could justly say that his support had been secured through indirection or mistake." The convention's subsequent reiteration of its orignal decision he should ever esteem as the highest honor that could be conferred upon him. The platform was "admirable;" it assured "conservative instead of rash action." The Judge's address was a long one, and our summary must be brief. Attention should be directed occasionally, he said, to the constitutional limitations of the powers of the three co-ordinate branches of the Government, owing to "unnecessary or impatient agitation for reforms" and because these limitations "are disregarded by officials desiring to accomplish that which to them seems good, whether the power exists in them or not:"

"It must be confessed that in the course of our history executives have employed powers not belonging to them; statutes have been passed that were expressly forbidden by the Constitution, and statutes have been set aside as unconstitutional when it was difficult to point out the provisions said to be offended against in their enactment; all this has been done with a good purpose, no doubt, but in disregard, nevertheless, of the fact that ours is a government of laws, not of men, deriving its 'just powers from the consent of the governed.' If we would have our Government continue during the ages to come for the benefit of those who shall succeed us, we must ever be on our guard against the danger of usurpation of that authority which resides in the whole people, whether the usurpation be by officials representing one of the three great departments of government, or by a body of men acting without a commission from the people."

Speaking of a growing "impatience of the restraints of law," he pointed to the dynamite murders in Colorado, and to the deportation of suspected persons there, saying that in both cases "the reign of law" had given way to "the reign of force." The perpetrators of the dynamite outrage ought, after due trial and conviction, to suffer the most rigorous punishment known to the law:

"Constitutional guaranties are violated whenever any citizen is denied the right to labor, to acquire and to enjoy property, or to reside where his interests or inclination may determine; and the fulfilment of the assurance to rebuke and punish all denials of these rights, whether brought about by individuals or by Government agencies, should be enforced by every official and supported by every citizen."

Having explained the difference between constitutionalism and imperialism, he turned to the present tariff law, "unjust in its operation, excessive in many of its rates, and so framed in particular instances as to exact inordinate profits from the people." He assumed that the Republican party would grati-

fy those who oppose any change whatever, or, at least, would not undertake "a revision of the tariff downward." He frankly conceded, however, that even if his party should be successful in November, "we cannot hope to secure a majority in the Senate during the next four years, and hence we shall be unable to secure any modification in the tariff save that to which the Republican majority in the Senate may consent." But his party was in favor of "a reasonable reduction of the tariff," which was "demanded by the best interests of both manufacturer and consumer:"

"The combinations, popularly called Trusts, which aim to secure a monopoly of trade in the necessaries of life as well as in those things that are employed upon the farm, in the factory and in many other fields of industry, have been encouraged and stimulated by excessive tariff duties. These operate to furnish a substantial market in the necessities of eighty millions of people, by practically excluding competition. With so large a market and highly remunerative prices continuing long after the line of possible competition would naturally be reached, the temptation of all engaged in the same business to combine so as to prevent competition at home and a resulting reduction of prices has proved irresistible in a number of cases. All men must agree that the net result of enacting laws that foster such inequitable conditions is most unfortunate for the people as a whole, and it would seem as if all ought to agree that the effective remedy would be to appropriately modify the offending law."

The growth of monopoly could not be laid at the doors of the courts, whose decisions warranted "the assertion that the common law, as developed, affords a complete legal remedy against monopolies." The multiplication of monopolies was due to "the failure of officials, charged with the duty of enforcing the law, to take the necessary procedure to procure the judgments of the courts, coupled with the fact that State Legislatures, as well as Congress, have by legislation encouraged their propagation:"

"What is needed—in addition to the passage of a statute revising the tariff duties to a reasonable basis—is not so much other and different laws, as officials having both the disposition and the courage to enforce existing law. While this is my view of the scope of the common law, if it should be made to appear that it is a mistaken one, then I favor such further legislation within constitutional limitations as will give the people a just and full measure of protection."

He found it "difficult to understand" how any American citizen, "much less a descendant of Revolutionary stock," could "tolerate the thought of permanently denying the right of self-government to the Filipinos:"

"The accident of war brought the Philippines into our possession and we are not at liberty to disregard the responsibility which thus came to us, but that responsibility will be best subserved by preparing the islanders as rapidly as possible for self-government and giving them the assurances that it will come as soon as they are reasonably prepared for it."

He denied that the United States had only recently become a world power; it had become such a power more than a century ago, and was made such a power by the liberty, advancement and prosperity of its citizens, not by any career of conquest. We were not a military people, but we loved peace. Such a military armament should be maintained as might be necessary for the security of the country and the protection of the rights of its citizens at home and abroad. "Any other course would be not only false economy, but pusillanimous:"

"I protest, however, against the feeling, now far too prevalent, that by reason of the commanding position we have assumed in the world, we must take part in the disputes and broils of foreign countries; and that because we have grown great we should intervene in every important question that arises in other parts of the world. I also protest against the erection of any such military establishment as would be required to maintain the country in that attitude. We should confine our international activities solely to matters in which the rights of the country or of our citizens are directly involved. That is not a situation of isolation but of independence."

Our Government, he remarked, "was not created for a career of political or civilizing evangelization in foreign countries or among alien races." In conclusion he announced his determination to retire to private life at the end of his term, if he should be elected. A renomination he should not accept. With him the controlling reason for such a decision was that "no incumbent of that office should ever be placed in a situation of possible temptation to

consider what the effect of action taken by him in an administrative matter of great importance might have upon his political fortunes."

Politics in the Civil Service

The President wrote to Attorney-General Moody on the 9th inst. concerning rumors, which he had heard, "of efforts to have District-Attorneys and Marshals in Alabama change deputies under them for political reasons." A movement for the removal of a Democratic Deputy-Marshal is said to have suggested the letter, in which Mr. Roosevelt said:

"Of all offices of the Government, those of the Department of Justice should be kept free from any suspicion of improper action on partisan or factional grounds. Please direct the District-Attorneys and the Marshals in question that they are to retain and appoint their subordinates, whose duties are purely non-partisan and non-political, on grounds of fitness only and without regard to other considerations. I am particularly anxious that the Federal court in a State like Alabama should win regard and respect of the people by an exhibition of scrupulous non-partisanship, so that there shall be gradually a growth, even tho a slow growth, in the knowledge that the Federal courts and the representatives of the Federal Department of Justice insist on meting out even-handed justice to all. No politician has a right to dictate in any manner to any of these officials."

A copy of the letter was sent to each of the officers in question.—Owing to a report from the Civil Service Commission that the spirit of the civil service rules has been violated in the Philadelphia Post Office, where political discrimination has been exercised in making appointments from the eligible register, the President, at the suggestion of the Commission, has sent a reprimand to Postmaster McMichael.

Certain and Swift Punishment Required

President Roosevelt was asked some weeks ago to commute to imprisonment for life the sentence of death imposed upon John W. Burley, a negro of Washington, for criminal assault upon a little girl less than five years old. An investigation having been made by Attorney-General Moody, Mr. Roosevelt has denied the application and directed that the sentence be carried into effect on the 26th inst., the date already fixed. His decision is accompanied by a statement of considerable length. "The man," says Mr. Roosevelt, "committed the most hideous crime known to our laws, and twice before he has committed crimes of a similar, tho less horrible, character." Allegations that Burley is not of sound mind do not, he thinks, deserve consideration. They were made after his trial and conviction:

"Nobody would pretend that there has ever been any such degree of mental unsoundness shown as would make people even consider sending him to an asylum if he had not committed this crime. Under such circumstances he should certainly be esteemed sane enough to suffer the penalty for his monstrous deed.

"I have scant sympathy with the plea of insanity advanced to save a man from the consequences of crime, when, unless that crime had been committed, it would have been impossible to persuade any responsible authority to commit him to an asylum as insane. Among the most dangerous criminals, and especially among those prone to commit this particular kind of offense, there are plenty of a temper so fiendish or so brutal as to be incompatible with any other than a brutish order of intelligence; but these men are nevertheless responsible for their acts, and nothing more tends to encourage crime among such men than the belief that through the plea of insanity or any other method it is possible for them to escape paying the just penalty of their crimes.

"The crime in question is one to the existence of which we largely owe the existence of that spirit of lawlessness which takes form in lynching. It is a crime so revolting that the criminal is not entitled to one particle of sympathy from any human being. It is essential that the punishment for it should be not only as certain, but as swift as possible. The jury in this case did their duty by recommending the infliction of the death penalty.

"It is to be regretted that we do not have special provision for more summary dealing with this type of cases. The more we do what in us lies to secure certain and swift justice in dealing with these cases, the more effectively do we work against the growth of that lynching spirit which is so full of evil omen for this people, because it seeks to avenge one infamous crime by the commission of another of equal infamy."

The Beef Workers' Strike

After long delay the union employees of the beef companies in New York, 3,500 in number, were ordered, on the 10th, to join the strikers,

and substantially all of them obeyed, admitting that they had no grievance, but asserting that the companies were shipping live stock from Chicago eastward to be slaughtered in New York by union men. The stationary engineers and firemen went out in sympathy, but their places were soon filled. Rioting in the streets near the New York packing houses kept the police busy, the strikers attempting by violence to prevent the delivery of beef in wagons. One policeman was wounded three times. Non-union men were pursued and beaten; a group of negroes defended themselves successfully by using their razors upon union assailants. There was a large supply of beef on hand, and the companies were doing about half their usual amount of work. At the end of the week there was evidence that needy strikers from Chicago were coming to New York and taking the places of union men there; it was asserted also that New York strikers were accepting employment at Chicago. In that city attempts were made, with the aid of Mayor Harrison, to settle the controversy, but the packers insisted that they had already won a victory. In South Omaha, on the 13th, the sheriff was unable to defend non-union men against a mob of 3,000 persons. He called for 500 more deputies.

Other Labor Controversies

The striking and locked-out workmen of the building trades in New York, about 25,000 in number, have repudiated, by resolutions adopted by their unions, the arbitration agreement made a year ago, declaring that it is no longer of binding force because the employers have violated it. On the other hand, they were locked out because of several strikes, all of which, the employers assert, were in distinct violation of the agreement. It is stated by the President of the Employers' Association that there is "little chance for graft" under this arbitration compact, and that, in his opinion, the strike movement must be part of a scheme "to revive the old graft system." The strike in the subway appears to have been a violation of an agreement more than three years old between the chief contractor and the Central Federated Union. On Saturday the Employers' Association by unanimous vote gave notice to the unions on strike (7 out of the 31 who signed the agreement last year) that their places would be filled by such workmen as could be obtained if they should not return to work on or before the 22d. This points to "the open shop," but the employers prefer to do business with the unions. Leaders of the locked-out workmen have brought suit against the Employers' Association, alleging that it exists in violation of the Anti-Trust law, and seeking, they say, to ascertain whether the arbitration agreement can be enforced by the courts.—The strike of the 40,000 garment workers in New York has been declared off. Only 5,000 strikers were still out. This is a victory for "the open shop."—In Washington, the strike of the bricklayers against the employment of a negro non-union man on a Government building has been declared off; but the places of nearly all the strikers had been filled, under the Civil Service rules.—The Macbeth-Evans Glass Company, the largest concern in the manufacture of lamp chimneys, employing 4,000 men, has given notice that hereafter it will have an "open shop," owing to the exactions of the unions, which, it asserts, have caused the loss of much of its export trade.—In Connecticut, the highest court has sustained the decision under which nine officers or prominent members of the Teamsters' Union in New Haven must go to jail for three months and pay $1,000 costs as punishment for conspiracy and intimidation in connection with a strike last year.—Owing to a sympathetic strike ordered to enforce a claim of 75 cents, all the union men employed by the builders in Hartford have been locked out. One Butler, a mason, was discharged for lack of work, and he was told to go to the office for his pay. He asked that it be brought to him. His employer consented to bring it, but when, after a little delay, he returned with it, Butler demanded 75 cents for the time that had elapsed since his discharge. In support of this demand the strike was ordered. The builders are inclined to stand for "the open shop."—Vice-Chancellor Pitney, of New Jersey, in Chancery Chambers last week, where a labor case was pending, said: "The country should declare 'open shop' in all trades. Politi-

cal economy will not allow any other course. The unions are making a mistake."—A strike on the New Haven street railways has been averted by a compromise, the company granting a slight increase of pay in response to the union's demand.

Railway Disaster in Colorado

Measured by loss of life, the railroad accident in Colorado on the night of the 7th was the most disastrous that has occurred in the United States. The World's Fair Flyer, a fast train on the Denver & Rio Grande Road, left Denver at 5 P.M. Three hours later, while the train was crossing a wooden bridge that spanned Dry Creek, an arroyo through which ordinarily a small brook flows to the neighboring Fountain River, the bridge gave way, and the locomotive, the baggage car, the smoking car and a chair car fell into a raging torrent 35 feet deep. Very heavy rain in the hills had suddenly filled the arroyo with a whirling flood that rose above the bridge and moved with such force that the passenger coaches were carried a quarter of a mile, turned upside down and half buried in the sand. Only three of the occupants of these coaches escaped death. At last accounts 74 bodies had been found—two of them 8 miles and one even 22 miles, from the broken bridge—and 28 persons were still missing. It is believed that a number of bodies are hidden by the shifting sand or were buried under the caving banks of the arroyo, and may never be recovered. The scene of the accident is near Eden and about 7 miles north of Pueblo, where 65 of the dead had their homes. It is said that a train that passed only a few minutes before this one had been flagged at Eden and warned there that the bridge was in a dangerous condition. On the following morning only a tiny stream could be seen in the bed of Dry Creek.

Countries South of Us

General Rafael Reyes assumed the office of President of Colombia on the 8th inst. Dispatches from Bogota, saying that complete calm prevailed there on that date, dispose of the rumors, circulated a few days earlier, to the effect that the American Legation had been attacked by a mob and that troops had been called out to protect Mr. Snyder, the Chargé d'Affaires. Dispatches from Panama say that congratulatory messages have been exchanged between President Reyes and President Amador, and that an establishment of diplomatic relations between Colombia and her lost province is expected.—The Venezuelan Chargé at Washington has received messages from the Minister of Foreign Affairs at Caracas asserting that the asphalt properties of the New York & Bermudez Company were seized in conformity with law by the Government, which had "requested a competent court" to declare the concession forfeited "because of non-fulfilment of obligations" which required the company to construct certain public works.—A revolution has broken out in Paraguay, and a small armed vessel which ascended the Parana River to meet the revolutionists has been captured by them. The acting Minister of War, who was on the Government's boat, attempted to escape by swimming to the shore, but he was caught. Several towns have been seized by the insurgents. It is expected that President Ezcurra's government will be overthrown.—The revolutionists in Uruguay are becoming more active, and a serious defeat of the Government forces was reported last week.—At the capital of Nicaragua the British Minister is pressing the claims of the turtle fishermen of Jamaica, whose schooners were seized by the Nicaraguan Government, and a British war ship is lying near Bluefields. It is reported that Nicaragua will invoke the good offices of our Government.

Turkey Makes Concessions

American diplomacy, backed by a naval demonstration, has at last secured from the Sultan the promise that the American schools in Turkey shall have the same rights and privileges as those of the most favored nation. There are about 300 American schools, hospitals and charitable institutions in Turkey, and these have been the object of much unjust treatment, discrimination and extortion by the Turkish officials for many

years. In 1901, by the agreement of Mystilene, France secured for the graduates of the French Medical School at Beirût the right to practice medicine in Turkey, but the Protestant Medical College, holding its charter from the State of New York, has been debarred from this privilege. In February, 1903, the President ordered Minister Leishman to seek an audience with the Sultan to secure remedy for these abuses, but it was not until April that an audience was obtained, and this resulted in nothing. A second audience was obtained with great difficulty on July 29th, 1904, and a response was promised August 2d. After waiting in vain for this a week longer the Mediterranean squadron, then at Villefranche, near Nice, was ordered to Smyrna to receive the American Minister in case negotiations should have been fruitless by the time the squadron arrived. The American squadron, under Rear-Admiral Jewell, consisting of the "Olympia," the "Baltimore" and the "Cleveland" reached Smyrna August 12th, and immediately the required concessions were granted by the Porte. The squadron has been ordered to return, and to join the rest of the European fleet at Gibraltar.

An Heir to the Russian Throne

On the day when the battle ship "Czarevitch" took refuge from the victorious Japanese fleet in a German port the birth of a Czarevitch was announced from the Alexandra Villa at Peterhof. The Czarina, whose four daughters had been such a disappointment to the Czar and the Russian people, on the afternoon of August 12th gave birth to a boy, weighing eleven pounds, sound and healthy. He is named Alexis Nikolaievitch and, if he reigns, will be Alexis II. The first Alexis was the second of the Romanoff dynasty, reigning from 1645 to 1676. The birth of this heir to the throne is received with great rejoicing by the Russian people and is regarded as due to the special intercession of the new St. Seraphim. A special petition for a male child to the Czar has long been included in the orthodox liturgy, and the holy Father John of Cronstadt has been at Peterhof recently, praying that his own prediction, that the Czarina would have seven daughters before a son was born, might not be fulfilled. Immediately after the birth a Te Deum was held in the Kazan Cathedral, attended by all the court, and the baby was made honorary colonel of the Finland Guards. Elaborate preparations are being made for the christening ceremony to take place August 20th. It is reported that half the prisoners in Russia will be released in honor of the event. The danger of the accession to the Russian throne of the sickly Grand Duke Michael, and of Boris and Cyril, the dissipated sons of the Grand Duke Vladimir, is now diminished.

The Flight of the Fleet

When the Japanese batteries approached so near to the harbor of Port Arthur that their shells struck the decks of the Russian vessels by vertical fire it was resolved to make a dash for liberty and join if possible the Vladivostok fleet. Accordingly, at dawn of August 10th the Russian fleet, consisting of six battle ships, four cruisers and eight torpedo boats and destroyers, emerged from the harbor. They were met by the Japanese fleet, composed, according to the Russian report, of three detachments; the first of six battle ships and two cruisers, the second of four cruisers and the third of five cruisers and a battle ship, together with some 30 torpedo boats. At 1 P.M., after forty minutes' fighting, the Russian fleet made its way through the Japanese line, in spite of the floating mines with which the torpedo boats strewed its path, and headed toward Wei-Hai-Wei. The Japanese pursued and overtook the fleet about 5 o'clock. The firing continued at a range of not less than 3,800 yards until dark, when the Russian fleet was scattered and disabled, part of the vessels returning to Port Arthur and the others taking refuge in neutral ports. Five of the battle ships and one of the cruisers, the "Diana," returned to the port they had left. The flagship "Czarevitch" was the center of attack during the afternoon and suffered severely. A torpedo broke her rudder shaft, and a shell, bursting on the bridge, killed Admiral Wittsoeft and several other officers; altogether there were 210 lives lost on the ship. Rear-Admiral Ouktomsky

assumed command of the squadron. The "Czarevitch" reached Tsing-Chau (Tsingtau) at the entrance of the German bay of Kiao-Chau. It was too badly damaged to be repaired quickly so the flag has been lowered, and it will remain disarmed in the harbor. The cruiser "Novik" and torpedo boat "Bezshumi" also sought shelter in the same port. Both vessels sailed within twenty-four hours, as required by the neutrality laws, after having obtained coal from British steamships in the harbor. The "Novik" was last seen wounded. She was put into the dry dock for repairs. Both vessels were notified by the Taotai, or Chinese Governor, to leave within forty-eight hours or be disarmed during the war. Neither alternative has yet been taken. The Russian commander claims the right to remain to effect the repairs necessary to make the vessel seaworthy. The Russian torpedo boat destroyer "Ryeshitelmi" took refuge in the harbor of Che-Foo, just west of Wei-Hai-Wei, but during the night two Japanese destroyers, the "Asashio" and the

Map Showing the Scene of the Two Naval Engagements

going south, between Shanghai and Nagasaki. The German battle ships "Fürst Bismarck" and "Hansa" cleared for action and barred the port to the Japanese fleet waiting outside. The Russian cruiser "Askold" and destroyer "Grozovoi" did not succeed in reaching Kiao-Chau before the Japanese, so they proceeded to Shanghai, where they arrived at 3 o'clock on the afternoon of the 13th. The "Askold" had two of her stacks destroyed, and two holes in her hull, one below and one above the water line; altogether there were 200 holes in her. Fifteen of the crew were killed and fifty "Kasumi," entered the harbor and captured her and towed her out. The Russian captain and twenty of his crew of fifty-one jumped overboard and were rescued by boats from the Chinese cruiser "Hai-Yung." The commander of the "Hai-Yung" protested against this violation of Chinese neutrality, and Russia has appealed to the Powers through France. The Russian captain struck the Japanese officer sent aboard his ship and threw him overboard, at the same time giving orders to blow up the ship. This action is held by the Japanese to be sufficient justification for their seizure of the destroyer. Two

of the Russian torpedo boats went ashore near Wei-Hai-Wei.—The Russian squadron from Vladivostok attempted to pass through the Korean Strait to effect a junction with the Port Arthur fleet, but was met by Vice-Admiral Kamimura north of Tsushima, and defeated in an engagement lasting five hours. The Russian cruiser "Rurik" was sunk and the other two cruisers, the "Rossia" and the "Gromoboi," were badly damaged, but escaped toward Vladivostok. This double victory leaves the Russian fleet much inferior to the Japanese, and practically puts an end to the Russian sea power in the Far East. There are five battle ship in Port Arthur, the "Sevastopol," the "Peresviet," the "Poltava," the "Pobieda" and the "Retvizan," and one cruiser, the "Diana," possibly also the "Pallada," whose whereabouts has not been reported since the fight. How badly damaged these are and whether they can be repaired under the guns of the Japanese is not known. If the Baltic fleet should sail now, as was expected, it would probably find no fleet to join and no harbor to enter by the time it reached the Pacific. The Japanese are in possession of the hills only two miles north of the fortifications of Port Arthur, which is being bombarded from sea and land.

Morocco

The extension of French influence in Morocco is not an easy task. A large proportion of the members of the Chamber of Deputies which constitute the *bloc* or solid majority supporting the administration of M. Combes is opposed to any form of foreign aggression, even that which goes by the mild designation of "the pacific penetration of Morocco." It is pointed out by the opponents of the policy that it must sooner or later result in the use of force, for no instance is recorded in history where a people has voluntarily submitted to such control as the French seek to exert over Morocco. The Sultan and many of the semi-Europeanized officials probably will facilitate as much as they can the French aspirations, but the Sultan does not appear to be a man of much force or wisdom, and he has already lost the sympathy and respect of a large part of his subjects by his adoption of foreign customs and disregard of Mohammedan law. The foreign population at first welcomed the idea of French domination, for the reason that it would put an end to the brigandage and disorder which has prevented the commercial development of the country, but it is admitted by the Paris papers that the sympathy of the foreign residents has markedly cooled since it became apparent that no active and energetic measures were immediately to be undertaken. A band of 80 brigands under the leadership of Ouled Bu Oukasha recently planned a kidnapping raid in the neighborhood of Tangier to capture Walter B. Harris, the correspondent of the London *Times* and the author of a recent article in THE INDEPENDENT on the Morocco situation. The members of the band claimed that Raisuli failed to share with them the ransom he extorted from the Government in the Perdicaris affair, and they proposed to obtain by the capture of Mr. Harris a ransom of $70,000, and the dismissal of the French controllers of customs, lately appointed. A hundred soldiers, sent to guard the house, prevented the consummation of the scheme. The Sultan showed his spiteful and petty spirit in resenting the reception given to his former Minister of War, El Menebhi, at Tangier, on his return from his pilgrimage to Mecca. A letter was sent from the Sultan to Mohammed el Torres, attacking him in abusive language for allowing a small guard of soldiers to meet El Menebhi. The officials at Alcazar and at Fez have by order of the Sultan seized all the houses, caravansaries, estates and other property belonging to El Menebhi. It is possible that the European Governments may protest against this unjust treatment of a distinguished man who has been so cordially received at their court, and has been decorated with so many of their orders. The crews of the French war ships at Tangier were fired upon recently when they were getting their water supplies from the wells on the beach. The Moorish troops, who were guilty of the attack, were punished. The Secretary of El Menebhi, Hamed Jaiya, who was arrested and imprisoned, and whose goods were confiscated by orders of the Sultan, is a British subject, and the British cruiser "Minerva" has gone to Tangier to give him protection.

The Mischief of the German Officer

BY POULTNEY BIGELOW

ON my way to Munich from Morocco I bought at the first Austrian railway station in the Brenner Pass a little book called "Aus Einer Kleinen Garnison," and the chatty guardian of the stall informed me that this was the one hundred and thirtieth thousand—that it had been forbidden in Germany and that the author was building himself a villa near Berlin out of the proceeds. Any book that has gone through 130 editions is worth a study—in spots, so to speak. This book I had, of course, heard about on its first appearance, because its author, Lieutenant von der Kyrburg, had been sent to prison for six months. Many friends asked me if I had read it, to which I was always happy to answer No, for I had assumed that it was merely a sensational thing devoid of historical interest.

On this railway ride I read it carefully from cover to cover and with sustained interest, for it is a human document of importance, at least to-day.

In parenthesis let us note that in Germany a popular novelist thinks he has achieved immense success when his sale reaches 50,000.

The author of this book is a Prussian officer who has simply gone upon the witness stand and related in artless, but very frank, language a series of episodes in his military career at a garrison town whose name is not mentioned, but which I suspect of being between Cologne and the French frontier.

The work is more important historically than "Uncle Tom's Cabin," because while Mrs. Stowe's memorable book addressed itself only to those who were ignorant of the American slave States and who were "abolitionists" on principle, the work of "Lieutenant Bilse" addresses itself to a public thoroughly conversant with every detail which he discusses. Indeed, no one but a German who has felt the influence of military caste can appreciate the testimony here offered.

Mrs. Stowe, moreover, made her appeal to the emotional side of our Northern States at a time when popular feeling against slavery in the abstract had become almost a fanatical part of New England theology. Mrs. Stowe was, moreover, an eloquent writer—a literary artist of considerable power.

The German officer has no more charm of recital than a log-book or a regimental blotter. We search his pages in vain for a single rhetorical effort; it is a very plain string of loosely woven incidents which he has written with the intention of letting his countrymen know what was possible in a regiment situated as his was.

It is of comparatively trifling importance whether an officer more or less gets drunk at mess, whether he drives his servant to desertion or suicide through brutal treatment, or whether he forges a signature and runs away with the wife of his brother officer. All these things are possible anywhere and we accept them as the incidents of every highly organized society.

The German officer demands and receives a superior social position throughout Germany because, like the traditional priest, he is presumed to be clothed with attributes denied to mere mortals like you and me.

The plain man has to be balloted for when he desires to enter a club—not so the German officer; such a proceeding would imply that there could be a possible question as to his eligibility for any circle which he might desire to honor with his company. In the German colony of Kiao-chau, in China, I found that no general club was possible for this simple reason.

The author of the "Little Garrison" was sent to jail, not because the book was a wicked invention, but because it was horribly truthful and terribly earnest. We have herein pictured a colonel, a major and some junior officers of a cavalry regiment, who frequently get drunk together at the mess, even when ladies are there as guests. Most of the officers appear to have seduced the wives of their brother officers. Most of them

are in debt, some of them stoop to dishonest means for getting their debts paid. One mortgages all he has, then issues promissory notes which a brother officer indorses, then he fraudulently sells his already hypothecated furniture to a Jew and decamps with the wife of a brother officer—finally shooting the woman and himself in a London lodging.

There is a somewhat painful sameness in the various characters; on laying down the book I find that I have but a composite picture, for they are little more than names, differing one from the other only in the grades from lieutenant to colonel.

The book gives an interesting picture of household customs, the more interesting as the book was obviously intended for home consumption only. No doubt the author was immensely amazed to find that this ill-written little tract should have been published in nearly every known tongue within a few weeks of its first appearance.

One character is a sergeant-major, who, in his cups, tells a brother non-com. how he makes money by accepting bribes and falsifying accounts. These two have a trifling altercation in the stables over the feeding of a horse; the superior non-com. reports the other for disobdience, with the result that this man, who has served nine years with a stainless record, is locked up for two months and then dismissed from the service. The sergeant-major was drunk when he had the altercation, but the word of the superior was taken as against the inferior, and the future of a promising soldier was blighted.

No wonder, then, that, as we later hear, this young man went over to the Socialists, became a leader and one night waylaid the sergeant-major who caused his disgrace and thrashed him thoroughly.

Then comes a little side light on the point of "honor" even among non-coms. The sergeant-major was disgraced in the eyes of the regiment because he had been treated ignominiously by a "civilian." He had tried to lie out of this condition of "dishonor" by pretending that he had severely wounded his assailant and put him to flight; but in Germany, where no child can cut its finger without official cognizance, the fact that no one was brought to hospital in wounded condition remained as satisfactory evidence that the sergeant-major had been worsted by a civilian, had not defended himself according to the code of honor, and was, therefore, no longer fit for honorable society.

In the same manner a major whose wife had run away from him because of his brutality challenged a brother officer who had been seen with said wife under compromising circumstances. The major was shot by the seducer, and all for the sake of a woman who had no honor to start with and who in the following chapter became a *demi-mondaine* in Berlin.

Then we have the sickening picture of an officer habitually calling his servants foul names and striking them in the face with fist or sword or anything that happens to come handy. We find perjury, cheating, coarseness at every turn—and we marvel at the enormous sale.

In Germany every man of full years has served in the army and every woman is familiar with its social side.

The life of the army is the life of a caste. Its scandals are hushed up in a manner that would not be possible in England or America. The brtuality between officers and men rarely gets to the light. The official and courtly press understand that matters within the military circle must be treated with peculiar consideration; and, consequently, it is only when a Socialist is on his feet in the Reichstag that we occasionally find the truth ventilated regarding a section of German society which has been referred to on very high authority as "the noblest of the noble."

Personally, I have seen German soldiers struck in the face by officers; I have heard soldiers called vile names, such as "Schweinhund," "Rindsvieh," "Kameel," etc. I have also known officers to act dishonorably. But the majority have impressed me as hard-working, intelligent, active, ambitious and humane men, comparing favorably with officers of any other army.

To be sure, my observations have been mainly among the officers of crack regiments, and my testimony is but that of a casual traveler.

It is more important to gather the opinion of the hundreds of thousands of Germans who have served in the ranks

and who to-day recognize in this "Story of a Little Garrison" something of their own experience. Soldiers tell me of corresponding treatment in their own regiments; officers even admit that the book has much truth. For many years we have been struck by the number of suicides in the German army. No life should be so healthy in peace time as that of the German soldier, and a suicide under such conditions needs the fullest explanation at the hands of the authorities. There have been latterly an unusually large number of scandals, well authenticated, of officers and non-commissioned officers treating their men so brutally as permanently to break down their health.

In a country like England or America each case would be thoroughly ventilated, but in Germany the secrets of the barrack-yard are more carefully guarded.

What we do know is that while the whole population has to pass through the army, the ranks of Socialism are being constantly recruited and that the mill of discontent is kept turning by an interminable stream of military grievances supplied by those who complete their term with the colors.

"Lieutenant Bilse" has said nothing new, but his book is, nevertheless, already a classic in Germany, a gospel of the discontented. Abuses there have always been within the limits of the German army. Many Germans knew of them, but all patriotic Germans cheerfully condoned them because they believed them to be very rare. The great majority of Germans, notably those who had served through the Franco-German War, had a loyal belief that the German officers as a body were the incorporation of manly virtues and chivalrous honor. The disposition to question this is a matter of very recent growth. The historical importance of the Bilse book is that its appearance marks a moment in Germany when the people commence to doubt the divinity of their military caste.

MUNICH, GERMANY.

The Labor Situation in Colorado

BY THE REV. CHARLES M. SHELDON

THE first thing that strikes the visitor to Cripple Creek, Col., is the fact that there is not a tree visible in the whole place as one looks down upon its checkerboard of little houses from the range above. The second thing that immediately impresses a newcomer is the large number of one-story houses. The next distinct impression is related in some definite manner to the altitude, which is 9,500 feet. It is my conviction, shared by many others, that the altitude does have a direct bearing on the action of the people. This gives room for a dissertation on the relation of atmospheric pressure to ethics.

Summed up in brief, Colorado's labor troubles (all of which practically have arisen in the Cripple Creek district, a territory less than six miles square in extent) are at present characterized by the following conditions:

First—There is no grievance on the part of the miners as to wages; $3 a day is the minimum. At the cost of living in the district a careful, sober miner can lay up money, and many of them have large deposits in the banks. Miners as a class live well; many of them *eat up*, practically, all they earn. Hundreds of miners here and in the iron mines of Michigan spend their entire savings in food. In scores of one-story houses that do not rise above the dignity of "shacks" can be found at meal time on the table the most expensive cuts of meat or the highest priced fruits and vegetables.

Second.—Practically every act of physical violence recorded since the beginning of the trouble has been the act of union against non-union men. Scores of men have been beaten, threatened, and in several instances killed, and, by the testimony of men from all classes, the

aggressors have been in overwhelming majority the members of the Western Federation.

Third.—The feeling against the Western Federation is shared by the business men, the churches, the average citizen and by large numbers of former members of the Federation.

Fourth.—There are at present writing about 4,280 men at work in the mines. Of this number 2,300 were former members of the Federation and have signed the applications for work issued by the Cripple Creek District Mine Owners' and Operators' Association, which pledges all applicants to sever their connection with the Western Federation. Those who do not promise to separate wholly from all connection with the Federation cannot receive an employment card for work in the district. This action was never taken by the mine owners until the Federation, according to general feeling, made it necessary. There is room for discussion on this point as to its ultimate result, but there is no room for dispute over the fact of what is actually going on.

Fifth.—Out of the entire number of men arrested and examined by the Citizens' Alliance less than 300 were deported as being dangerous to the safety of the district. Of this number the great majority were single men, and a majority of all were, on their own confession, saloon keepers, gamblers and men without moral standing in the community.

Sixth.—Seventy-five or eighty-five per cent. of the members of the Western Federation, it is claimed, expressly disclaimed any grievance and protested against declaring for the strike, but were led into it by headstrong and incompetent leaders.

Seventh.—Whatever the cause, the general feeling in the district is one of deep hostility to the Western Federation. Out of the 6,000 members of the Federation over 2,300 have already renounced all connection with it, and applicants besiege the office of the Association daily.

Eighth.—Practical evidence of the intimidation exerted by the union men is easy to get in Cripple Creek, Victor or Independence. One of the applicants for employment in the Association office showed me the deep scars on his face, marks of a brutal assault he had sustained from members of the Federation three years ago. They had beaten him into insensibility while he was working as a "scab" and so frightened him that he had joined the Federation and paid his dues until last Christmas, when he burned his card, and, fearing violence again, had moved out of the district. Many other miners confess to the secretary the same experience.

Ninth.—There has been no attempt on the part of the mine owners to reduce wages at any time during the troubles. There is no complaint from the miners on this score. This fact would hardly need emphasis except for the absurd falsehoods current, creating artificial sympathy.

Tenth.—The fact most distinct of all seems to be the fact of incompetent, unwise, arrogant and unauthorized leadership in the Western Federation. With a man like John Mitchell in control such a serious succession of mistakes on the part of the Federation could not have occurred. It is the old story of labor becoming labor's worst enemy on account of bad leadership.

Eleventh.—At the present moment unionism, so far as the Cripple Creek District is concerned, is impossible. The sentiment in the district is deeply hostile to the Federation.

Twelfth.—I have made no attempt to discuss the action of the Citizens' Alliance that assumed control of the district, nor is this a defense of the State in its military occupation of the district. Those are matters which are open to discussion as connected with the facts in the case. But their relation to the tragedy of the whole labor movement in Colorado does not and cannot change the facts themselves.

TRINIDAD, COL.

In Front of "Old St. Louis"

General Impressions of the Fair

BY MRS. L. H. HARRIS

ALL expositions look alike to us. They vary in architectural effects, in details, and in magnificence, but to the casual observer they are all composed of the same showy, shining substances. This accounts for the fact that, altho the St. Louis Fair is the greatest and most expensive enterprise of the kind ever undertaken, it excites neither the interest nor the appreciation accorded to some famous expositions. Our capacity for wonder has been destroyed and our faculty of discrimination is not yet highly developed. Therefore, the average visitor is ready to declare that he has "seen it all before." He has not, of course, but the effect produced upon his mind is the same, because he saw pictures, statues, reaping machines and California pumpkins at every other exposition he has attended.

That which really distinguishes the Fair is the fact that it is more nearly autochthonous in motive and character than any other exposition has ever been. It is a huge, handsome likeness of a young country. It represents on a grander scale than ever before the beauty, resources, strength, and awkwardness of American adolescence. And it shows nearly all the imperfections of vigorous, unabashed youth; without a single evidence of senility, except perhaps a few beautifully vicious statues and paintings borrowed from the galleries of Europe. Everything, from anthropology to machinery, from agriculture to art, indicates progress rather than maturity, experimental energy rather than the sedate conclusion of the whole matter.

This is as it should be. Our period of gestation as a nation is not over; there are too many different kinds of men here, and a corresponding divergence in ideas and definitions. We are incomplete

Opening Ceremonies at the Louisiana Purchase Monument. Festival Hall and Cascade in the Distance

in national consciousness, our powers of conception not fully developed, our energies more or less distracted. And anything from a government to a fair that represents us must be adaptable, progressive rather than finished or fixed. This brings us to the point of observation between the power to conceive and the actual accomplishment,—a difference which marks with hopeful imperfections all that we undertake in this country. Just now the Fair is a colossal illustration of this fact. The thing conceived was evidently greater than that which has been evolved. The impression of repose and perfection could scarcely have been secured even if sufficient time had been granted to finish every detail. For the incompleteness is really psychic, not merely a matter of unpaved streets, crowded exhibits and half finished buildings. We have neither the age, patience nor sense of finality necessary for the finishing of things. If every brick were laid and every exhibit in order, there would still remain evidences of the unattained ideal. And, at last, the most significant impression of the Fair is its demonstration of American potentialities. The splendor of what has actually been achieved is lost in the suggestion of the superb development yet to come. Those people who complain of the immaturity and incompleteness of the Fair have simply missed the cue to the whole performance. Such an undertaking can never seem complete until the nation is full grown in consciousness and matured in the ability to execute.

The Fair is strikingly American in another sense—its bigness. In this country the imagination is greatly affected by the idea of immense space and enormous resources; and our ambition is to create something commensurate with this natural environment. Thus the Exposition is spread out on purpose; the fact of having fifty more acres under cover than the Chicago Fair had is accounted as proof of its being a greater achievement. And this, of course, is but a further illustration of our youthful provincialism, of our indiscriminate energy and pride.

It is difficult to determine whether

ideality or practicality is the predominant motive of the Fair. At night, when the cheapness of material is hidden, and the design of the artists and architects floats upon the darkness like a celestial city, lined and starred with a million lights, the illusion of something transcendantly beautiful is so perfect one is convinced that ideality rules. But in the revealing light of day we cannot escape the impression that the heart of the thing is practical, industrial and commercial. The point is, material things and natural forces have been so developed as to surpass the idealist's imagination, and he is amazed to discover in the Liberal Arts Building, for instance, how far ingenuity outwits genius. Everywhere science proclaims no less emphatically than faith "All things are possible." More particularly the Fair illustrates the passion of this age to bring things near, to realize the incredible. Nothing is left so secure in memory or imagination that art or invention has not produced it somewhere in form and fact. They bring the ends of the earth and time together, and the visitor on the Pike may find himself anywhere from Creation's dawn to its conclusion in "The Hereafter." He may see one of the most famous engagements of the Boer War, or he can be a tourist among the snowy peaks of the Tyrolean Alps. The latter is said to be a brewery enterprise, invented to supply a romantic and respectable background to a beer garden,—and this clever trickery is as near as we really come to the poetry and ideality of an elder day. The rest is an advertisement of electricity and modern architecture on the outside, and of steel-nerved modern progress within.

In the first onward movement of a great advance it is interesting to observe what things become traditional; and if we may draw conclusions from evidences at the Fair, religion is already traditional in so far as it is a merely church-and-creed expression of piety. Morality, law and respectability are proved by the closing of the gates on Sunday, by the general harmlessness of amusements on the Pike, by provisions made for decency and order upon the

Façade of the Varied Industries Building

Palace of Electricity at Night

grounds. And there are Christian Endeavoring institutions of various kinds, from women's restaurants to bureaus of information; but there are no definite exhibits showing the advance or decadence of Christian faith in the world, such as we find among the educational, economic and social exhibits. On the other hand, traditional religion is well represented,—by relics from the Vatican, by chapels in the Irish village and Tyrolean Alps, by innumerable sacred pictures, and by a model of Solomon's temple. The question naturally arises, where is the Institutional Church or any other progressive form of distinctly religious development? Doubtless places of worship have been provided, but the only life-sized illustration of a living religion, erected for exhibition purposes, is the Mosque in the Jerusalem Concession. This does not imply that the Fair is without religious complexion, but it means that Christianity as taught by creeds has been to a great degree eliminated, and that if it is included at all it is incorporated, illustrated by the philanthropic and educational features, and by every honest hospitable effort to care for the people who go there,—all of which is in keeping with the advance movement of the times, as it is out of keeping with the ecstatic, personal, sentimental Christianity of a former period.

The Fair clearly demonstrates the progress made in the real world of mind and matter. These two elements have come together and exalted themselves in grace and power. And some of the things exhibited denote the unscrupulous ferocity back of the great idea,—like the new sixteen-inch cannon in the Government Building that may be used to destroy a town twenty miles away, provided the town obstructed the modern ideal of progress and civilization.

But this ambition to advance in the scale of things may be carried so far as to become an inversion of the original purpose, and this is illustrated by some compositions of public school children in the educational exhibit. These are pathetically correct essays on history and other subjects. And they are no more the natural products of a child's vague mind than poetry is the rational expression of mechanics. After all, we are kin to the ancestor-worshiping Chinese at

this point. Our system of education does not develop what a child really is, but it trains him to be as nearly as possible in mind and motive like the men who lived and thought behind him. He writes, parses, thinks and hopes for the same things his forefathers did. At this rate we shall never accomplish anything but a wider circle around the graves of our ancestors. Much less shall we learn the science of becoming immortal. If these excellent elderly compositions of little children on exhibition prove anything, they show that the imagination, originality and individuality of the victims have been destroyed. For the faculties of a child are nebulous, their natural thinking is the indistinct, half imagined reflections of young minds more or less heavenly in essence,—and it is spiritual and intellectual persecution to exchange these before they mature into poetry, art and religion for the capacity to write a two-page " parrot essay " on literature.

Visitors to the Fair will not fail to see Cronje, if they enter the Boer War Concession. The passing of heroes is one of the saddest pageants of modern times. There is no longer a place for them in the order of things. We are all too nearly on the same level in the audacity of personal consciousness, and we have lost the sentiment which formerly haloed and sanctified them. They excite interest and curiosity more than they command admiration. And if by chance one leaps into action among us, we vulgarize him with a stare. We place him on exhibition and count his teeth. This explains why Cronje is the poster advertisement of a mimic battle at the Fair. We have seduced him for a price to the environment of a sawdust arena, and he has exchanged his military dignity for circus-ring applause. Nor is it altogether Cronje's fault that he is willing to stand under a calico canopy and receive the congratulations of a giggling mob. It is the fault of the mob, licensed and trained to stare, and spit, and guffaw at the wrong things, in the wrong place, and at the wrong time. Heroism is a delicate experience, as easily lost as a spiritual ecstasy. Few men keep it, or remain worthy of it under ideal conditions,—not one, in Cronje's present situation. He has been destroyed, literally, to make an American holiday. And his case is not the only one among us where a hero has been sacrificed upon the altar of a sight-seeing public. The lust of the eye is, indeed, a more comprehensive sin than we are accustomed to think it is, and there are many features of the Fair besides this Ichabod-hero of the Boer War that appeal to it.

In this article the American characteristics of the Fair alone have been considered, but the prospective visitor must remember that it is a " World's " Fair, and that there is a sufficient array of foreign exhibits to afford a staid and sober background to our brilliant but comparatively crude achievements.

St. Louis, Mo.

Quadriga Group, by Lopez

Tomb (Seen from Above), Showing Bits of Tufa Rock

Same Tomb, After Removal of Broken Rock, Showing Large Vase Containing Burnt Bones and Small Vases

Recent Excavations in Rome

BY RICHARD NORTON

Director of the American School of Classical Studies at Rome

WHEN Commendatore Boni began to excavate in the Roman Forum some five years ago it was obvious enough to any practical archeologist that he was sure to find interesting objects and to bring a certain amount of order, at least, out of the chaos in which the Forum then was. No one, however, could have foreseen the full measure of success that has rewarded his unremitting labors. First came the altar raised on the spot where Cæsar's body was burned; then, on tearing down the ugly church of Santa Maria Liberatrice, the discovery of the church of Santa Maria Antiqua, with its walls still covered with most interesting frescoes of the eighth century; then the finding of the rostra of the time of Cæsar, and nearby the altar to the god Volcanal, and, to mention but one of many more discoveries, the tomb of Romulus. This last was not a tomb in the sense of containing any actual remains, but was the spot on which ancient tradition had fixed as connected in some way with the death of the founder of the city and which ancient piety had marked with a black stone. When this spot was cleared and the little bronze statuets and other offerings made by worshipers five centuries before Christ were sorted and cleaned, even the most enthusiastic students had no suspicion of the surprise that awaited them about two hundred yards away beside the temple of Antoninus and Faustina. Here Boni found a real necropolis with the tombs unrifled and in surprisingly perfect condition, considering that stately buildings with deep foundations of concrete had been built immediately above them. The reason for their preservation was that they were of so old a time that several centuries had passed between the days when the bodies were laid away and when the buildings were erected, during which time the brooks that flowed down from the neighboring hills covered them with silt, and the Tiber, flooding all this part of the city, added its quota of yellow mud to the earth above them; hence the foundations of the later buildings scarcely reached them.

These graves are of different sorts; in some the burned body was laid away with various offerings in large terra cotta vases, while in others the body was buried in a coffin made of a hollowed log or between carefully laid stone slabs. In nearly all cases a mass of broken tufa rock had been piled above the graves. Forty-two of these graves have been found and there is no doubt that there were many more, but the excavation of them cannot go on much longer because the area that can be dug is limited by the Regia, the Temple of Antoninus and Faustina and other buildings that one cannot burrow under.

The discovery of these tombs is interesting for many reasons. One is that it shows that at the time they were made

Vases Taken from the Same Tomb; the Large One in the Center Was Made to Represent the Houses in Which the People Lived

the Forum as such did not exist, and the tribes of those days must have been living on the neighboring hills. Historic Rome was yet unfounded. Just what was the date when the tombs were made is by no means easy to settle, for there is no very fixed standard to judge by. Comparison with similar finds made elsewhere in Italy makes it clear, however, that they are probably at least as old as the eighth century before Christ. That they could be but little later than this is shown by there being in them no examples of imported Greek vases and scarcely a trace of other foreign objects, such as are common in graves in this part of Italy after this date. In a sense they are disappointing, for the vases they contain are rude; nothing but the coarse, black bucchero ware, which is interesting enough from the point of view of the student of early civilization, but was the product of semi-barbarous and uncivilized people. Taken as a whole, this necropolis adds to the growing belief that the stories of the beginnings of Rome are based on generally accurate tradition.

The mention of these vases brings up another interesting find. Last autumn Signor Boni found beneath the late imperial pavement a large foundation of concrete which he identified as the base of the famous equestrian statue of Domitian. This identification was greeted (just as the tomb of Romulus had been) with many foolish criticisms by those who grudge Boni his success, but it is accepted now. Not content with discovering the base of the monument, Boni sought for the corner-stone, or, more accurately, the deposit made when it was inaugurated. This he found. It consisted of a large square block of travestine set in the concrete in the middle of the east side. In the top of the block was a square chamber covered by a slab of travertine the same width as the block. It was the contents of the chamber that was of special interest, for it consisted of five vases, three of them of the regular bucchero type such as were found in the tombs, and two of a similiarly crude red fabric. Heretofore no one had supposed that the use of bucchero had lasted as late as the time of Domitian, but its use had been supposed to have stopped two or three centuries before Christ; the find of this deposit shows that, at least for ritual purposes, its use continued several centuries later, as did that of other ancient types of vases in the worship of Vesta and in the rites of the Arval Brethren.

The base of another equestrian statue, that of Quintus Marcius Tremulus, one of the victorious generals of republican Rome, has also been laid bare between Domitian's statue and the temple of Cæsar.

The most recent discovery of all, and one that is not yet entirely completed, is that of the Lacus Curtius. Next to the tomb of Romulus this is, perhaps, the most interesting spot connected with the early traditions and history of Rome. Noticing a fragment of coping just visible in the late imperial pavement of the Forum—a coping similar to the one around the tomb of Romulus—Boni was led to remove the blocks of this paving.

Grave (Seen from Above), Containing Coffin Made of Hollowed Log and Native Vases

Underneath he found a much earlier tufa pavement set at a different angle and oriented on the lines of the earlier monuments that he has found. This pavement seems to have been of a small, inclosed precinct, in which was originally an altar, remains of which are visible, and nearby were remains of a sacrifice.

Just as there were various ancient forms of the tradition about the "Black Stone" or the tomb of Romulus, so there were about the Lacus Curtius. Some writers connected the spot with Mervius Curtius, the general of the Sabines when they fought with Romulus; others with Caius Curtius, the consul who in 445 B. C. put up an altar where the lightning had struck, but the familiar story of Marcus Curtius, who rode full armed into the chasm that had opened in the Forum, is the oldest, and it was to commemorate this action that the altar now found was erected. Very possibly these are parts of the very altar that Ovid knew and wrote of in the Fasti (vi, 404):

"Curtius ille lacus, siccas qui sustinet aras.
Nunc solida est tellus, sed lacus ante fuit."

When the work at this spot has gone a little further it is practically certain that many votive offerings will be found. As yet only two or three archaic bronze coins have turned up.

Such have been the most interesting of the recent discoveries, and we confidently look forward to their being followed by others of no less importance. The Basilica Cumilia is but half dug, the part of the Forum near the Temple of Saturn still offers opportunities, and one uninteresting modern church having been done away with for the sake of finding Sta. Maria Antiqua and clearing the Temple of Augustus, we may hope that the churches of Santa Martina and San Adriano, which cover the ancient Curia and Senate-house, will also be removed and give thereby an opportunity for excavating the very heart of ancient Rome.

Rome, Italy.

Country Folk Ways

BY E. P. POWELL

Author of "Old Farm Days," "Windbreaks, Hedges and Shelters," Etc.

OUTINGS to distant lakes and mountains are all very well; but our common roads, if enough of them are put together, make as unique camping out places as are anywhere to be found. I can walk, for two hours, into glens, and under hills, and among brooks and where wild flowers grow,—and not climb a fence or go through a gate. This has been my fortune in half a dozen states; till I have come to think of the whole road system of America as a great park, in which the farms and private properties are of secondary interest. I believe in road improvement too; but I am glad that you cannot smooth out, and run lawn mowers over one hundredth part of the folk-drives. They will, for a hundred years yet, wind about among the cattails, and cross brooks on planks, and be hung over by big willows, and somewheres will scramble up steep gully-sides, where one can pick blackberries.

The life of a tramp is not so bad, if one only brush away the unnecessary prowlishness of it, and the pilfering. I can imagine a very splendid tramp, and a refined tramp life. One need not sleep in dirty straw stacks, or under rail fences; for do not the beech leaves drop all along the roadways? Strap to your back a small canvas tent; carry a cake of soap, a toothbrush and a hair brush, and a couple of towels. The brooks will serve for water bowls, and one may get a bowl of milk and bread at any farm house, into which he may dump the berries that he has picked himself.

One day I came on a Gipsey camp, by the roadside. They were getting ready for night. The women were cooking a supper, and the men were baiting their horses. It was not only interesting, but the smell of the supper had also a certain wild bewitcherie about it. I asked the oldest man, who seemed much like a Welshman, why they lived out of doors. He answered, "Because, Zir, we likes it. That's all, Zir, we just like it for zure. You likes houses, and houses it is—and you are quite welcome. We likes the fields, and the road, and the trees, and the running water. We owns a part in the roadside Zure, docen't we—all over the world? Well, we means to use it—it's land enough for us, Zur." Yes, I said, but how when it rains? "Well, Zur, when it do be hard coming, sometimes a shed is fairly good; and there are barns to be zure without building them; but mostly I do think that a big hemlock is enough,—and our wagons are tight for women and children." I confess that I never leave a company of these wayfarers without a slight suspicion that we have overdone our house building and caretaking. All children are natural tramps, they would never live in a house if they could help it. Why is it that there is such a delight in camping out?

O, the things one sees a tramping—
The green wild things that grow;
The gleam of the tall field lily;
The tangle of ferns below;
The gay glad life of the tree tops;
The shadows that slowly fall;
The long still slope of the meadow,
And the blue sky over all.

O, the things one sees a tramping—
The whisper of woodland trees,
The laugh of a happy brooklet;
The murmur of sleepy bees;
The roll of the distant thunder;
The drip of the silver rain;
The startled rush of a squirrel;
Then bob'o'links note again.

O, the things one feels a tramping—
The joy of the country road;
A "faring in gipsey fashion,"
With never a gipsey's load;
Delight in the world of beauty;
A rapture of love and praise,
And a will to make life the truer
For the glory of common days.

The chief charm of New England roadsides is in the wild roses. They are especially fine in Maine. I see thousands of bunches that I crave to dig and take home. If I could do this my acres would have to expand, as the United States has expanded—benevolently over my neighbors. I am not quite sure what they would say about giving up their potato patches. There is, however, not much danger, as the running roots of these roses are very hard to dig; and they are worse to pack and transplant. One may go wandering for hours and days along these Maine roads, and forever be finding something novel, as well as useful. I have always longed to be there when the barberries are ripe. What a glorious scarlet must border those roadways for miles and miles. They tell me that the people make great use of the berries; and yet there are enough left to make the winter landscape look warm.

In Michigan I knew country roads where the drives went along between moist, rich soil, and there were on both sides to be picked yellow-fringed orchids and cypripediums—both pink and yellow; and then one would suddently come on grand patches of crimson cardinal flowers. Turn a little to the right, or the left, and the road would bring us down to the Raisin River; and there it would wind between huge masses of ferns, with here and there a knoll, run all over with wild strawberries and pigeon berries. Always with me went Charlie C., one of those quiet sweet-faced, clear-eyed young tramps, who knew every tree within a radius of ten miles. He had an instinct for such things; knew just where to lead me to find a rare plant, or to find a clear trout brook;—but he would never allow the fish to be caught. Once he led me away from the roadside to a swamp prairie—through woods where oaks and hickories stood over one hundred feet tall—the noblest forest I ever saw. Then suddenly he brought me around a turn, where the wet prairie held at least a full quarter acre of scarlet lobelia—as magnificent a display of wild glory as I ever saw. We were soon back again on a woodman's road, that revelled in clematis on the bushes; and was bordered with fringed gentian.

This road soon wound around a tiny lake, such as are scattered all over Michigan, and sometimes bend the roads out of straight lines. The banks of this lake were a garden of blueberries, mirrored in the water. While fairly cramming ourselves with the berries we heard a curious squeal. On examination it proved to be the despairing cry of a frog, half way down the throat of a snake. Charlie was somewhat divided as to his moral duty in the case; but he finally took the frog by his legs and pulled him out, more scared than hurt. To this day I am in doubt just how much we have a right to meddle in the struggle for existence that is going on about us. Harmless snakes and frogs are about equally useful to human beings; so that from the humanitarian point of view there are no sides to take; and one must either take the frogarian or the serpentarian view of things. Well, the serpent, you know, tempted Eve; so that settled the matter. We compromised by letting the snake go. He wriggled his tongue at us, and went. One must get over one's born prejudices; yet I don't quite like to carry these wriggling things in my pockets, as my boys sometimes do.

Here in Central New York I have found another little tramp—the son of an Irish washerwoman—who has the same keen instinct for nature. He knows the whole world of things, as the old theologians knew all about the worlds hereafter. He takes us to the rare orchids, and he has an eye to see just far enough. Some people see what is within sight, while others, as my hired John said, see "over beyant, beyant." Now, beyond the beyond is a bit of description only possible to an Irishman; but my little friend saw the yond only; the through; and many a tramp we took—I to learn how to see, and he joyful in showing. Generally these little fellows don't amount to much, by and by, because the schools spoil them. I wish we had in each county one tramp school. I think it would save a lot of vagabonds and a lot of school waifs. It ought to teach the youngster how to use himself; how to see better, how to hear better, how to smell better, and how to taste better—the very things that are ignored in our common schools. They tell me that little Australians, that is the natives, get down on all fours, and run like dogs,

on the trail of marauders—tracking rapidly by scent. But after we get breeches on them, and civilize them a bit, they lose the nose power. Do our schools educate some powers out of us, while they educate others in? Will some one open a school for the direct purpose of creating oddities?

Of all States I think Missouri gave me the most really wild roadsides. The dewberry, in absolute perfection, climbed over rocks and rail fences, and rested its bunches of berries on innumerable stumps—coal black mouthfuls, luscious, chock full of memory. I do not remember the thorns at all. There were also thimbleberries, with large red flowers, and very thin fruit—not satisfying. There were also sloe bushes, and wild peaches, with fruit; and in swampy places there was a snarl of ferns. But really I remember distinctly nothing that grew anything near those dewberries.

About my New York home the old blackberry fields are about gone, and we have civilized them pretty well out of the roadside. This robs blackberrying of most of its favor. I am sure if my dog "Ranger" were alive, he would not care so much for a garden stroll as for an all-day's romp through the glens, and up and down the wild wayside. Heyday! But did we two not have big fun? One must have a rag tag suit of clothing, specially for the occasion. These were kept under an old lounge; and when Ranger saw them pulled out his joy went into bounds and barks. He jumped all over me, and in a language "The Autocrat of the Breakfast Table" could not criticize, conveyed his satisfaction. Then he led the way. All day we went through the wildest byways and highways and glens; and at night you could have seen us trailing a foothill road, or through Hardings woods—played out, worked out; and ready for a huge bowl of milk bread,—and the berries of our own picking. No one who goes a-berrying ever fails to sleep. I don't know what other folks long for when they are sick; as for me, I always keep wishing that I could go on one of those blackberry tramps. Bless the dear dog! He has been gone these fifty years. He was a wonderful friend. He could pick his own blackberries with his teeth, drawing apart his lips—and he relished them. No short tramps for him, but a genuine all day farewell to civilization. At noon we sat down together; he on his haunches, and I on a log, and he studied the contents of my pockets. It was an awful gorge in a hillside where we found the best berries; and there was little else to meddle or compete with that horrible barbarian among our fruits, that positively refuses to be civilized. Everything else recognizes man's sovereignty, and holds up its hands under fire of the plow and the hoe; but the blackberry is as defiant as it was ten thousand years ago, when it thorned pre-anthropoids; and kept its footing on two continents.

Almost everywhere about country roads are occasional apple trees. Some of these the farmers have grafted; occasionally one is run all over with wild grape vines, and is loaded with thorn apples. Most of them have been allowed to lean more or less; and that made them convenient for school children to climb. I remember one that bent over at an angle of fifty degrees, so that we could walk up it; and up there was a favorite place for a robin to build her nest—in a hole in the trunk. She got used to us, and we never meddled. When the young ones flew they would sit in the branches, and open their mouths to us, as if we were to feed them. When folk are decent, birds soon find it out. They flock about us, share our homes with us, and share our berries too. It is mostly cats that they dread and that keep them away from our houses. Shut your cat, if you must have one, in a big cat house—something like a rabbit warren—with chambers and parlors and play yards, and let her stay there form the first of May till some time in September. This is no hardship for a cat if well fed; and the birds will comprehend it quickly. They will build in your porches, and hop about your door; and clean the worms out of your trees. Why should we make a companion of one of the tiger family, and make it impossible for our natural friends to rear their families near us?

Wild cherries have a peculiar liking for roadsides, and so also have wild plums. Some of these are good—for boys—and what are left delight the robins. A little later the catbirds and indigo birds and many others flock into the trees, and glean them. In the South-

west I came, late in the fall, on persimmon trees, growing by the roadside—not very shapely, but loaded with golden fruit. Please take care and prove the ripeness of this fruit, or you will be unable to tell the story of your tramp. It is the most astringent stuff that nature has been able to fool us with. But ripe persimmons ought not to be left altogether to the good taste of possums.

I suppose that I ought not to regret the passage of the bull thistle and its companions, but I do. In those days the world was full of yellow birds, goldfinches and red-winged blackbirds; and probably toward night the wood thrush. In some parts of New Jersey the whip-poor-will prowls along the roadsides of an evening. If we were friendly, squirrels were sure to try to make our acquaintance; and if not too noisy the frogs would go right ahead with their singing. Swallows sat in long rows on the telegraph wires—in those days one wire was quite enough, even near cities. Mullen and elecampane grew in big patches almost everywhere; but our children do not know what the satiny weed is, if they see it. There was plenty of milkweed, full of delight for children when the pods were full of cotton; but the old folks cut it for greens. In the deep hollows and undrained places stood the tall straight cattails—first rate for making arrows; and near by sweet flag—and next the school house. Tansy was plenty, and it is to-day; but I do not often come on the white thoroughwort—both good to have on hand in the store room. Besides peppermint, there was spearmint, horsemint, catmint, and a little creeping mint that I cannot name. I remember well when College street had only a winding footpath through bull thistles and Canada thistles; and now we have our plank walks, our lawn mowers, our electric lights and our telephone poles. It is one of the penalties of progress, that one must lose the delicious chatter of goldfinches, picking seeds from the thistles. And there were bumble bees in those days, lots of them. We tied them up in hollyhocks, and rapped them against each others' ears.

When a brook gurgles out of a field, and follows the road for a while, I find that it is likely to bring a good many things out of grandma's garden, and sow them in with the mints and loose strife. I can take you to some bunches of forget-me-not, white and blue, and have knowledge of little calceolarias, growing on sand heaps, where a brook runs under a plank bridge. I have also found the Star of Bethlehem carried off in this way and planted. These brooks are curious affairs, always laying out little beds along their sides, for some of their favorites. So you shall see that the whole margin, on both sides, makes a garden—a part of it of wild plants, and part of it of cultivated. Nearly every brook does this, and spends a good deal of time watering its own plant beds. It is likely to have cowslips and watercress. The other day I came upon a big brook, out of a huge glen, that came furiously down toward the road; but as it came nearer, it divided about the washed out roots of a big beech, and then the parts shook hands peaceably just at the roadside, in a pool, where I saw tiny fishes and fed them crumbs from my pocket. There it dropped all fun and frolic, and went off into a meadow, to water the grass. There was a mill in sight. I know another brook which cannot be tamed. It seems to be haunted with fear, as it dashes out of the dark woods. It dives under a bridge; gives a twist to a lot of willow bushes; rolls stones out of their honest beds, and tears away, to deliver its message somewhere—on and on, all a-foam. If you look over the fence you will see snipes wading in the pool. Once I caught a mink up this brook, and there are weasels there—the meanest of all our wild creatures—the incarnation of death. I do not altogether like this neighborhood, and seldom go there.

Sometimes my mood carries me to the top of a big bluff, where the road has an outlook over half the township. A big wood is near by, where crows build their nests, and hawks scream—both bird outlaws—that eat robins, and are heartily hated by the whole great federal republic of honest feathered citizens. The nearest meadow is all white with daisies.

"Dayeyse, or elles the eye of day;
The emperice and flower of flowers always."

Over this meadow the bobolinks are skimming and singing. But I am looking farther down, far off upon the house-

tops, and over the gardens, and where the big cornfields are growing—and all the human world is found. It is wonderful what a command over this world man has asserted and gained.

I wish you knew more about some of our roadside plants; indeed, I long to know more myself. In wet places there is a curious plant called celandine, with exquisite orange flowers, and seed pods that snap open with a pop, to scatter their seeds. Then there are evening primroses,—but on dry spots, with frank-eyed, yellow, sweetish flowers, that open in the edge of evening. Charlie taught me how to sit down, quietly, by one of these plants, and hear the flowers burst open—breaking the sheath with a sudden rip. For half an hour the popping goes on, and then the bush stands gloriously arrayed in gold, and the perfume is spread out all about you. Golden rods begin to blossom by midsummer, but the different varieties are not through with yellowing the creekside and the roadsides until October.

A patient, pensive silence fills the wood,
Broken by muffled droppings, sad as tears;
A sense, half understood,
Of something sweet that was and is no more,
Stirs in the heart. Summer is going we say.
But see, as dreamily she goes her way,
She drops the golden scepter of her gracious sway.

I do not wish to say anything to discourage vacations; yet one must count the cost. What are we to make of the outpour of city people into ugly inns and costly hotels, where every room is associated with the artful rather than with nature. There is an uninformed striving to get away from city confinement. Yet it is not extravagant to say that one-half the popular summer outings are painful in every sense of the word. Better by all odds find some wild place, where you can put up a cheap hut and live with mother nature, can sleep on pine boughs, and cover yourself with a blanket. But do not race through hundreds of miles of Paradise in order to find rest. Chautauquas even are to be taken with discrimination. I was never more tired in my life than when taking in two weeks of literary activity, that began at eight in the morning and ended at ten at night. I carried away a disputatious mood, and my bones ached. The mind is a good deal like the body. One has been over dressed, and the other over addressed, with speeches and sermons. These are the drugs offered us by millenium makers. The trees and the valleys and the birds and the brooks know better what to do with us.

Dr. Edward Everett used to say, when he took his hat, "I am going in for a walk." When he stepped back inside the doors he called it "going out of the house." He meant to say that his real house was his orchard, his garden, and the whole warm world of life; and his house was only a shelter from the storm. Really the one most foreign place to a natural soul is inside doors. Professor Search says of school children that with all a child's love for the outer world of beauty, and his instincts for sunshine and light, it is no wonder that he is glad when it is time to get out of doors. "It is taken for granted that the growing plant must be placed in a window for full appropriation of light; but no one thinks of the similar need and soul cravings of the human plant." Watch how soon you can ruin a geranium by setting it in partial shade of the sunlight the brighter part of each summer day? I remember very well that the most delightful part of my early school days experience was the time when we rambled slowly homeward among the roadside plants; watching the butterflies, listening to the birds, or hanging over the edges of pools. The Italian proverb tells us that where the sun does not go, the doctor goes. I look forward to the day when that which our boys and girls get by the roadside will be as much held to be education as that which somebody else has seen for them, and put into a book. Half a day of strolling, and seeing, and hearing, and smelling, will be worth quite as much as another half-day of reading and memorizing. I am not sorry that the little red school houses by the roadside are going; but there was one good thing about them, they were surrounded by lots of weeds—most of them worth study; and they were studied. Along the roadside I picked up some of the best lessons of my boyhood.

CLINTON, N. Y.

The Labor "Rebellion" in Colorado

BY WILLIAM ENGLISH WALLING

[Mr. Walling is a resident of the University Settlement in this city, and a student of industrial conditions, in which work he has lately made a careful investigation of the troubles in Colorado. His view is that which is held by the labor unions in Colorado. — EDITOR.]

THERE is being fought out in Colorado to-day the most momentous issue that has ever faced the working people of this country: Is a labor strike a rebellion? For six months the Colorado situation has filled the labor press until it is now recognized by Mr. Gompers and the American Federation of Labor as the most pressing question before the unions. From every corner of the country money is pouring in to the Colorado unions in sums of from five dollars to twenty-five hundred to carry on the fight against "political despotism." Already several hundred thousand dollars have been received and there is hardly a union in the country that has not contributed.

United States Senator Patterson says that the two strikes that have crippled the mines and industries of Colorado for a year past are among the most peaceful ever known. His view is sustained by impartial citizens of the State and by investigators that have gone to the field. But Governor Peabody has declared both strikes to be insurrection and rebellion against the State and has acted accordingly with the "rebel" strikers. His acts have been legalized by the Supreme Court, indorsed by the Republican party and applauded by practically the entire business community of the State.

Outside the State Governor Peabody has been condemned by a large part of the press of the country. But the conservative press of Colorado and its most prominent business men, those who are best informed and most concerned, are with him. The business community of Colorado has supported the Governor in all or nearly all his acts. It must share the praise or blame for what has been done. Governor Peabody could never have done what he has done without the support of the business element.

The employing class has good reason to stand by the Governor. If his policy becomes embodied in government it will settle every difficulty in the fight that is being waged everywhere against the unions—without the delay, expense and uncertainty of an appeal to the courts. Picketing is at once made a criminal offense—no Taff Vale decision is required. Damage suits against union officials become unnecessary. Union officials are summarily locked up or sent from the district under "military necessity." Talking or writing in favor of the union is forbidden. "Military necessity" does not beat about the bush. It goes straight to the goal. Striking becomes a crime. One Davis, who was one of the union's Executive Committee at Cripple Creek, was arrested under military necessity and held several months without trial. When he was finally brought before the court the prosecuting attorney confessed he had no evidence whatever against him. In the meanwhile his wife, in constant fear of her husband's life, gave premature birth to a child and both have since died. "If the business men of the East will study Colorado," I was told again and again, "they will learn how to handle these labor agitators."

"Law and order" is the cry of the business interests. But the Colorado strikes have not been lawless. "The Western Federation must go," they say. "It is a criminal organization." But the attack is not limited to the Western Federation. The coal miners' union (John Mitchell's) has been attacked by the same methods, and every union in the State has in one way or another felt the Governor's hand.

"I hail the Western Federation as the most progressive and aggressive of all the labor unions in the country to-day," said Organizer Wardjon, of the coal miners. "Let every workingman realize that this is a fight of organized capital against organized labor." A former Governor also assured me that it was the purpose

of the administration to drive the unions from the State. There has been no lack of public statements and other evidence to the same effect.

But will the effort to crush the unions succeed? It is an error hastily to answer, No. The business interests are acting almost as a man. The Government of the State is completely in their hands. The decision of the Supreme Court has given them absolute power. They are not separated by party differences. The Republicans in their recent convention publicly approved of the Governor's "courageous acts." The business interests have expressed their gratitude by putting down the Governor's rival, Senator Wolcott, and placing the machinery of the party completely in the hands of his faction.

The dominant faction in the Democratic machine is conservative, composed largely of business men and corporation lawyers. I talked with some of them. One, comparing the success of the mine owners with the difficulties of the Chicago packers, said they were on the up grade in the East, while Colorado had passed the climax and was going down hill. He defended the mobs of the Citizens' Alliance and thought he would have done the same under the same conditions. He approved of Governor Peabody and martial law, tho he expected to take political advantage of what he considered to be the mistakes of the Supreme Court and the militia. The Western Federation of Miners were "a lot of red-handed anarchists and murderers" to be annihilated. The unions he was "glad to see licked." He proposed to get the union votes, but their platform was to be ignored and a candidate for Governor was to be chosen who "would concede nothing whatever to the labor element." The workingmen were to be given two conservative candidates, one Democratic and one Republican, and they were to be told: "Now choose, —— you, choose." Another Democratic leader, a former Governor, has threatened to bolt if there is any pandering to the labor element. Another, equally prominent, has nothing to say about the Citizens' Alliance or martial law, tho he objects to the deportations.

The Democrats do not object to the use of the Government to break the strike, but to the methods of its use. First, the labor element has threatened to run an independent ticket. It was the vote the third parties drew from the Democrats that elected Peabody. The unions, united under their Ways and Means Committee, already have six organizers scattered over the State organizing political clubs. Then, if the Democrats do not lose the labor vote, they fear it may be cut down by the deportations. Hundreds of votes may be lost in Teller County alone in this way. The power of deportation gives absolute control over the political complexion of each district. One judge showed me a letter from a deportee who, he said, was entirely honest, to the effect that he had been deported because he had refused to promise to vote for Peabody. Finally, the militia may be used to intimidate voters at the polls.

The principle that a strike may be treated as a rebellion is guiding General Bell and Governor Peabody. This seems to disturb nobody except the workingmen. The doubts that arise in the minds of some business men are entirely concerned with the political wisdom of their more extreme actions. They may lead to a political reaction. Even if Colorado is safe, Peabody is injuring the national Republican ticket. Local unions of the coal miners in other States have already declared they will not support any party that supports Peabody. Judge Dixon, a Republican leader of Pueblo, says: "If we indorse the war policy of the present administration, other Republican States will have the right to assume that the same shadow will come to their doors when the necessity and opportunity arise." Or if the reaction does not come at once it may come later. Some political contingency may put another Waite in the Governor's chair. If Governor Peabody can close down a mine because its operation is obnoxious to him or to the mine owners, why cannot a Governor Waite close down a mine that is objectionable to the miners? But the dominant factions in both parties and in the business world have answered each of these questions to their satisfaction. The labor element, say the Democrats, will only re-elect Peabody if they run an independent ticket. The Republicans claim that enough business men's and farmers'

votes can be gained so that the labor vote may be dispensed with. Besides, the Colorado Fuel and Iron Company and the mine owners are in absolute control of several counties, and other corporations will contribute liberally toward Republican success. If both parties can be controlled, no Waite can ever get into power again.

Behind the mining interests stands nearly the whole business community: the Colorado Fuel and Iron Company, the American Smelting and Refining Company, the railroads, mills and smelters; dependent lawyers, brokers, engineers, and nearly all the commercial interests. The Citizens' Alliance has enlisted nearly 29,000 members in its fight against the unions. The business interests of Colorado are all built up around the mines. In the pressure to use the Government for the purpose of the employers there was no middle class, no disinterested public to interfere. The business interests of Colorado cannot be called more lawless than those of other States until the other States have met this crisis—all the important industries of the State crippled at one time by two great strikes.

The country has passed a verdict against Colorado of lawlessness on both sides. But there has been no lawlessness proven against the Miners' Union since the strike began. There have been no mobs and no riots except those of the Citizens' Alliance. Realizing that they depend on public sympathy for success, the Western Federation has begged and warned its members not to participate in violence of any kind. Neither the Federation or its officers have been convicted of any of the innumerable offenses with which they have been charged.

When there has been lack of evidence the mine owners have talked of deep-laid plots, tho the union was honeycombed with its detectives without any resulting discoveries. When the juries found nothing, it was said a fair trial could not be obtained, tho the jurors were unobjectionable at the outset and chosen through a friendly clerk and sheriff. When the judges found nothing they were vilified and a change of venue taken, all without any result. Even the Governor and Attorney-General have gone out of their way to attack Judge Leeds, a man with an unblemished record up to date. But the Republican Judge Lewis was equally unable to find any evidence implicating the Federation. The judges were not always appealed to. The militia has discovered many plots justifying arrest or deportations, even if no evidence could be found for the courts. The intentions of the Federation were, in the minds of the Governor, General Bell and the mine owners, of a criminal nature. Then there is the Federation's past record in the Cœur d'Alene District. When I asked the Governor for evidence of the criminality of the Federation, he read an account of two cases of violence that had occurred a year before the strike. There had been no evidence whatever to connect one of them with the union. A trail of blood, he said, had followed the organization from the Cœur d'Alene to Colorado. Only two of the dozen leaders in Cripple Creek had ever worked in the Cœur d'Alene, I found, and only one of the Executive Committee of the Federation, consisting of eleven members. Against these the mine owners have tried to prove criminal affiliations, without success. Whatever its policy in the past, the Federation is now bidding for the good will of the people of the mountain States. Already it has passed eight-hour bills in Utah and other States, and its constitutional amendment for this purpose in Colorado got 72,000 out of 100,000 votes.

The military are in Cripple Creek, not to enforce the law, but to break the strike. If any further evidence of this were needed than the statements of Governor Peabody and General Bell, it can be obtained from the officers at Cripple Creek, who will tell you in so many words that strikers are rebels against the State. General Bell has said recently that the strike ceased as a strike when the militia arrived and has since existed "as a secret rebellion against the State."

The militia has arrested and deported miners by the wholesale without trial, but General Bell could tell me of no single case where such measures had been taken either against the mine owners or Citizens' Alliance, which have openly organized mobs, beaten miners, destroyed property, warned men to leave the camp and forced the resignation of officials

with threats of lynching. He has just issued a public statement that he could not guarantee the safety of persons obnoxious to the "citizens" of Cripple Creek.

The militia, the present Government of Teller County (installed by the mob), the Mine Owners' Association and the Citizens' Alliance are, for practical purposes, one. General Bell has been a mine manager; Captain Wells, in command at Telluride, is a mine manager. Captain Moore is a storekeeper and an active member of the Citizens' Alliance. The military commission that has sent nearly two hundred miners from Teller County is presided over by a mine owner, and six of its nine members are mine owners, leasers or managers. A majority of the coroner's jury that has landed a large number of miners in jail are mine owners and managers. A dozen men run the county. The committee that called on the commissioners of Teller County to demand the resignation of County Clerk Mannix a few days ago had on it three members of the military commission, T. J. Dalzell, Nelson Franklin and Mayor French, of Victor. It is impossible to locate the origin of any given policy, so inextricably confused are the constituted authorities with the Mine Owners' Association and the Citizens' Alliance.

Revolution, not lawlessness, is the word for the actions of the ruling powers in Cripple Creek. A member of the military commission told me that the choice was between civil revolution or giving up the operation of the mines. So we have not only military rule in place of civil government, but a civil revolution approved by the military powers. Sheriff, marshals and aldermen were all forced to resign and were replaced by the mine owners' friends. The Mine Owners' Association and Citizens' Alliance have not disobeyed the officers of the law, they have replaced them.

There will be only one political issue before the working people of Colorado: Is the machinery of government to be used to crush the unions? If Governor Peabody or the Republican candidate is re-elected the employers of other States will try the Colorado experiment, and the issue will be fought out in other States. If the unions by entering into politics in Colorado succeed in routing their enemies, the unions of other States will follow their example.

At an enormous expense the unions have been driven from the principal mines and smelters of the State. There is not a union outside the mines that has failed to suffer from the miners' defeat. But the union feeling is bitter and the union spirit unbroken. They feel they are fighting a battle for all the unions of the country, and they know that no cause has ever received such a powerful and united support from the working people.

CRIPPLE CREEK, COL.

Sacrament

BY MINNIE FERRIS HAUENSTEIN

COOL, in the shrouding shadows of the night,
The table in that Upper Room was laid;
No glittering goblet there, no cloth arrayed
In silvern broideries,—only the white
Of one poor wheaten loaf to glad the sight,
One cup for all, Betrayer and Betrayed;
O'er these in deepest thanks the Master prayed
Unheeding gloom and taunt of vanquished might.
Belovèd Christ, so patient in Thy pain,
I shrink to own my starveling heart of fear
That counts the petty coin of common care
As t'were some Calvary, or thorn-cut stain!
O, let me breathe that faith-charged atmosphere
That made Thee conquer even Death's despair.

BUFFALO, N. Y.

The Story of a Cripple Creek Miner

BY ROSS B. MOUDY

[To supplement the observations of Mr. Walling and Mr. Sheldon on the Cripple Creek situation we have asked one of the miners to give us a plain statement of his experiences and observations, as a union and non-union man. Mr. Moudy worked in the mills and mines of Cripple Creek and vicinity for several years until the breaking out of the great strike a year ago, when he was appointed Assistant State Chemist of Wyoming. — Editor.]

BEFORE I went to Cripple Creek I went to work in a chlorination mill in Florence, which is just thirty miles south of Cripple Creek, and found that I had arrived just in time to reap the benefit of a strike there, which the mill workers had won the day before. It seems that they had been working nine and ten hours a day for from $1.50 to $2.00 per day, and as one could not get board and room anywhere for less than $30.00 per month, it took just about all one could earn to live on, especially as the mill would shut down for at least two days every month and two per cent. of the wages were deducted for hospital fees. The work in the mill is not so dangerous as disagreeable and unhealthy, as one is all the time in an atmosphere of sulphur dioxide, or chlorin, or dust, so that one cannot see an object two feet away; so it was no wonder to me that they struck. But $2.00 for eight hours of that kind of work is nothing great.

It was not long before the dust and gas began to act on me and I went to the mill surgeon about it. He told me I had better quit, but asked me not to tell the managers, for they always had a hard time to fill those places, and that no man could stand it long. So I quit and went to Cripple Creek.

The minimum wages for miners and men working around the mines at Cripple Creek was $3.00 per day. Men running machine drills got from $4.00 to $6.00 per day, according to the kind of place they had to work in—that is, whether the place was wet or dangerous. Machine men working in a wet shaft usually got about $6.00, and the helpers got from 50 cents to $1.00 less than the machine men. Engineers received from $4.00 to $7.00 a day, depending on the place they worked in.

In all the mines around Cripple Creek the miners worked only eight hours a day, and on a good many mines the miners were allowed to go down in the mine, come out of the mine, eat dinner and change clothes on the company's time. That means, that if the men begin to go down into the holes at 8 a.m., come out at 11.30 and eat dinner, go down again at noon, begin to come out sometimes as early as twenty minutes to four and change clothes, and at 4 p.m. they can go; so they do not all of them work eight hours, but oftentimes nearer seven hours. Of course, most of the mines worked the men the full eight hours.

The last mine in which I worked was a very safe mine compared with most of them, but the dangers do not seem so great to a practiced miner, who is used to climbing hundreds of feet on stulls or braces put about six feet apart, one above the other, and then walking the same distance on a couple of poles sometimes not larger than fence rails, where a misstep would mean a long drop. But to a novice all the dangers stand out doubly strong. For instance, the stockholders of the mine I worked at visited the mine in a body. They were wealthy capitalists from New York, Boston and Chicago. Well, the first thing they did was to get inside the bucket, because they dared not stand on the rim and hold to the cable to ride down as the miners do. One of the capitalists in particular seemed to be afraid even to walk on the solid rock of the bottom level, and when the superintendent finally succeeded in getting him up into one of the stopes after a series of falls and slips he looked more like a ghost than a man. He told one of the miners, who was working near him, that he thought it took lots of courage to work in a place like that, and

when the miner told him that they got used to it, he said that instead of being paid $3.00 per day they ought to have all the gold they could take out.

The hospital discount is usually from one to two dollars a month, and merely gives one attendance if he is hurt. This is deducted from your check every month. On some mines it is compulsory to take this. This is not admitted by the managers, but the unions have watched it pretty carefully, and if a man does not pay hospital fees he does not stay very long at his job. The same thing is true of the mine insurance, which is from three to five dollars a month. This insurance is put up by some of the insurance companies, and, of course, as they do not have to have an agent to collect this money every month, it is supposed that the management gets a rake-off. But the worst of it is that if a man is hurt badly or disabled for life through the carelessness of the mine's managers, before he receives his insurance he has to sign a paper releasing the mine owners from all responsibility for the accident, and then he cannot collect damages in the courts. In this way the mine owners shield themselves against the consequences of their neglect of the legal precautions for the safety of the men. The managers say that they have this insurance as a help for the men, as some of them would not have a cent if they were killed and leave large families, but on some of the mines, even if a man had insurance in a good company and did not want to, or could not afford to, take out more, he has the mine insurance forced on him against his will, and at higher premium than he would have to pay to an independent company. In Cripple Creek there are no company stores, and the miners do not have to furnish their own powder when they work for wages.

While I was in Cripple Creek there was only one mine, the "Strong," which would not employ union men, and a number of them would employ nothing but union men, and every month the men would have to show their union card paid up; but at most of the mines it made no difference whether a man was union or non-union, just as long as his work was satisfactory.

Shortly after I went to Cripple Creek the union posted notices that all men working in mines would have to join the union by a certain date, or be called a scab, and the walking delegate came to me and told me if I did not join I could not work at the mines. If he had asked me to join I would probably have done it, but as it was, I didn't join for a year when a friend of mine presented the matter in a favorable light.

There were a few fights and deeds of violence after the date set for joining the union, but they subsided, and one seemed just as safe whether he was union or non-union. Up to the time I joined I was acquainted with a number of very nice men who belonged to the union, and most of the union men I met did not treat me any differently than they did members. I joined because I saw it would help me to keep in work and for protection in case of accident or sickness, for the union is just like any other secret order that way. They pay ten dollars a week sick benefits, and hire three nurses at three dollars per day of eight hours; so if one is alone and sick he is sure to be taken care of. There were a good many mines where they required union men, and as I was out of work a good deal I found out that it was easier to get work and keep work on those mines if I had a union card.

Of course, there were a lot of hotheads in the union, but they were always held down, and I know from attending the union meetings during one strike down there that they never talked dynamite before the union as a whole, for the union leaders kept cautioning against such things as likely to hurt their cause. But there are some men who are always ready to take matters in their own hands and do what they think is best with violence.

The president and the secretary of the union I belonged to were both young men, who were leasing a mine and hiring men themselves and were making quite a stake, but they held on to the union; and when a strike was called they would not even ship their own ore, because it would go to a non-union mill, so they stopped work until they could get a union mill to treat their ore for them. This was the time when the strike was first started in

sympathy with the mill men in Colorado Springs and Colorado City.

While I was in Cripple Creek about a dozen Austrians came up from the coal camps and were going to do cheap labor; so a bunch of men escorted them out of town and told them not to come back; but these men were not all union men, for even non-union men like to draw their three and three and a half dollars a day. So now the Citizens' Alliance claim that they can do the same thing as well as the union men; but, of course, two wrongs do not make a right, and, besides, they have gone into places and destroyed property which belonged to the union. Of course, they are in power, as they have their own organization backed by the militia, but the camp will be unionized again some time, for the men will not work without trying to protect themselves against accidents in the dangerous places where they have to work, in such mantraps as the " Hoosier " mine, for instance.

The mining laws of Colorado are not enforced at all, and it is on account of this that so many lives are lost. The mine inspector very seldom goes to Cripple Creek, and, when he does, he does not stay more than a few days, and, of course, cannot see one hundredth part of the mines. If he should make an inspection of a single one of the big mines it would take all the time he usually spends in the entire district.

For example, the mining laws of Colorado require a cage for every shaft over two hundred feet deep, and I do not know one hole two hundred feet deep that has a cage, and know of lots that are from four to six hundred that have nothing but a bucket. Things like these an inspector would not have to go down in a mine at all to find out.

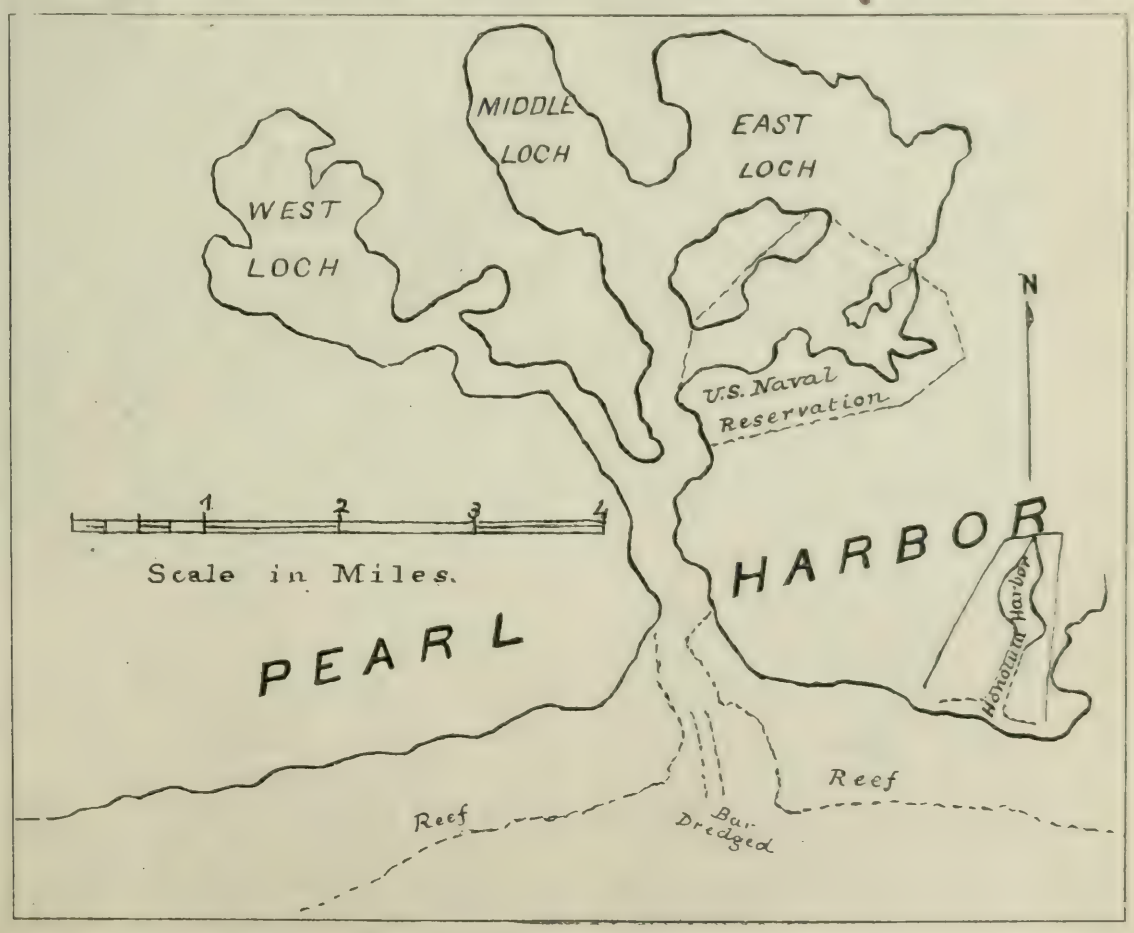
Then, too, many of the mines have immense stopes with hardly a timber in them, and these places are known all over the camp, but the mine inspector seems never to find it out. In short, the mine inspection in Cripple Creek is nothing but a farce.

A good point about the unions is the attention they give to the State Government. Every bill that passes the Legislature or that is presented to the Legislature is read in the union and discussed, and if they are not satisfactory to the union they call upon their representatives to work against it. Most of the union men are socialists, but they believe the change will come about gradually and not by revolution.

The part of mining that bothered me the most was the mine gas, owing to poor ventilation, and many times I have been carried out unconscious and not able to work for two or three days after. Several men died from effects of gas while I was in the district. But outside of getting a couple of toes smashed from falling rocks and a crack on the head from a bolt which fell about two hundred feet down the shaft and struck the door and glanced into the station, knocking me out for over a week, I got out of the district rather luckily.

I batched for the last year I was in Cripple Creek, as I found I could save a little money that way. The house I lived in was made of one thickness of boards, covered with corrugated iron—an oven in summer and an ice-box in winter. I had to get up early in the morning, eat my breakfast half cooked and half frozen, and then walk, or run, a mile and a half over the trail to the mine. A man changes every two weeks to another of the three eight-hour shifts into which the day is divided. After I got back to the shack and got cleaned up and my supper cooked and eaten, it was usually too late and I was too tired to do anything more than read the paper, or write a letter home or to the one who would soon make a home for me.

LARAMIE, WYO.



The Urgent Need of Pearl Harbor

BY SERENO E. BISHOP, D.D.

TWENTY-EIGHT years ago General Grant and other American statesmen fully discerned the need of Pearl Harbor to the United States, and in order to secure possession of it they concluded a mutually profitable Treaty of Reciprocity with King Kalakaua of Hawaii. Six years ago, when a little war with Spain broke out, Congress hastened to annex this Hawaiian group, in order to hold firmly this strong and solitary vantage-point of sea power and ocean defense off the American coast. This was wise and prompt action. Hawaii became a Territory of the United States, passing under the Federal Constitution, merging its independence under the larger Federal security, and enjoying such advantages as the change secured, not without also some disadvantages, but with a large prospective share in the coming grand destiny of American Pacific commerce and sea power.

But since that sudden annexation, military and naval precaution for the Pacific seems to have been slumbering. The one thing to do was at once to open, improve and fortify Pearl Harbor, the priceless feature that gives to Hawaii its fullest strategic value. Yet now, after six years of inactive ownership, Congress has just permitted to lapse a very moderate proposed appropriation of half a million dollars to begin the work of improvement. And this indifference to the security of our Pacific sea power is shown in the actual presence in the neighboring Orient of a fierce flame of naval conflict, whose conflagration is not unlikely yet to involve all Europe, and even America, especially if provoked by careless unprecaution. It is true that the Pacific is broad, and Hawaii is somewhat distant from Japan and from Manchurian ports, and much more remote from European navies. But a firm, consolidated grasp upon an important stronghold will make for continued peace as well as security.

It would seem probable that Congress-

men and Senators share with the bulk of the nation most hazy notions about a locality like Hawaii, lying out in the ocean beyond the bounds of the continent. Nine-tenths of the American people are probably unaware that Hawaii has been for six years a regularly organized Territory of the United States. A majority think of Hawaii as some little group of cannibal islands lying like Samoa or Fiji far away in the "South Seas," instead of being the notable crossroads of the Pacific, and the one outlying Territory and solitary grand outpost of American civilization, facing the great Asiatic Empires, and central to the giant commerce of the twentieth century, to which the Panama Canal is to lend enormous impetus. For over two thousand miles beyond the Golden Gate toward China not a rock or reef breaks the surf waves, until suddenly arise the grand domes and pinnacles of the Hawaiian mountains, with their lovely towns and gracious American homes. And then beyond them for four thousand miles more are none but insignificant islets amid the endless billows.

Our great nation occupies the 3,000 miles of long northeastern frontage of the vast Pacific Ocean. Across the northern half of this ocean has already begun to ply some of the enormous commerce springing up between the imperial populations of the confronting coasts of Occident and Orient. This North Pacific is soon to be alive with the swift and throbbing shuttles of a gigantic ocean traffic, greater than the world has yet seen, because larger and more highly developed populations are about to be involved. For the trade with the empires of China and Japan is to be not merely that from our Pacific Coast, but that from both sides of the Atlantic through the Panama Canal. Now by means of its favored and solitary central position, Hawaii is the key point of control of this ocean upon its eastern half, and Pearl Harbor is the key to Hawaii. It is, therefore, of vital and urgent necessity that Pearl Harbor should at once be made tenable and secure. In its present neglected condition it constitutes a strong temptation to a hostile Power to seize it, and gain permanent advantage by robbing America of her natural predominance in the Pacific. An early and thorough occupation of this precious stronghold must make for peace by deterring interference.

For the uses of the coming giant commerce, as well as for the naval control of the North Pacific, this snug little Honolulu harbor is practically useless. Honolulu is a most lovely American city. Its harbor is most accessible, convenient and absolutely secure from storm, behind its sheltering reef. But it is too small for extensive commercial uses, and wholly without capacity for any great naval station. Worse yet, it is absolutely incapable of defense from hostile attack, because it is in close vicinity to the open sea. Ships in the inmost harbor are only 3,000 yards from an enemy hovering in the calm open roadstead. No shore batteries could efficiently protect from such attack. All docks, magazines and coal sheds would be at the mercy of the foe, save as defended by a superior naval force. Absolutely essential is spacious and secure anchorage well inland, to be protected by shore batteries many miles nearer to the off-shore enemy.

These conditions are superbly met by Pearl Harbor, whose entrance is six miles and its selected naval station seven miles west of Honolulu. It fully meets all the needs of the situation. It supplies areas of fully 2,400 acres for the anchorage of the largest ships, or twenty times the anchorage area at Honolulu. And these areas lie from four to six miles inland from the nearest point of the outer roadstead, whence the attack of an enemy must be delivered. Within one and a half miles of such enemy an indefinite number of masked batteries would be planted along several miles of beach, so as to repel the foe outside of the reef, the beaches being already occupied by groves of Algaroba trees. The entrance to the harbor is extremely long and narrow, and easily defended against the most insidious torpedo boats.

Altho not one of the class of largest harbors of the globe, Pearl Harbor is one of the larger havens, and amply spacious for any possible commerce. It has the peculiar advantage over most of the larger harbors in that it is completely subdivided into river-like channels not over 2,000 feet in width, of which there are over ten miles in length, all of deep water. Thus, in case of violent gales, no-

where is sufficient water area exposed to generate a seaway, such as is occasionally distressing to ships anchored at San Francisco. And here it is fitting to state that really violent storms never rage around the Hawaiian Islands—that is, gales, such as to necessitate furling of all topsails or to endanger important spars. Hurricanes or typhoons are absolutely unknown in this part of the ocean, altho occurring rarely 2,000 miles east and west.

In these ten or twelve miles of deep river channels five hundred of the largest classes of ocean steamers could find ample anchorage. Along the low perpendicular coral banks one hundred battle ships could be moored, end to end, and in many places could run planks ashore. But in addition to these deep-water areas, there are three broad reaches of water or lochs, farther inland, containing spaces amounting to 3,500 acres more, of which probably one-half is over two fathoms deep. This could, if ever needed, easily be dredged out to any required depth, having been shoaled by the wash of the uplands. To sum up the whole, we find here over three square miles of deep water, and half as much capable of equal deepening. Precision in these statistics is not claimed, altho they are believed closely to approximate. The Navy Department possesses maps and soundings of completeness and accuracy.

The land adjacent to the deep channels as well as to the shoaler lochs above, is entirely composed of level coral flats covered with a stratum of soil, varying from six to fifteen feet above sea level. It is thus admirably adapted for all commercial uses, as well as for the naval station. The drydocks will easily be excavated in the soft but compact coral. There are no marshy lands, except above the upper lochs. The fresh water supply is perfect. Numerous artesian wells along the neighboring shores yield the purest of water, already employed in irrigating extensive cane fields along the anchorages. Natural sanitary conditions are excellent. A three-foot rise and fall of tide twice a day in the lagoons promises sufficient current to maintain due sanitation even when harbor and city become crowded. The balmy trade winds sweep constantly across the flats and reaches of water. Temperatures range from 52 degrees minimum to 88 degrees maximum—a subtropical climate. Torrid heats are as unknown as winter frosts. Without exaggeration, an ideal location is thus described.

But with all this wonderful harbor provision made by Nature, what has man done to make it available? Thus far next to nothing. In view of war already waged in the Orient by the United States; in view of the fierce conflict now there in progress for the mastery of the sea, one would look for an eager activity to secure and develop the rare advantages of this site. Strange to say, they remain nearly as undeveloped and quite as unavailable and undefended as Nature has left them. There was a wide sand bar blocking the entrance to the port. Through this, at the slight cost of a little over $100,000, a 250-foot channel has been dredged thirty feet deep and 1,500 feet long. But that work stopped, leaving a large number of minor obstructions rendering the entrance unsafe if not impossible for larger vessels. Perhaps $150,000 has been spent in purchasing a well-chosen site for a naval station and drydocks, comprising several hundred acres. But not a dollar has been expended for its improvement, not a nail driven or a pick struck; and Congress carelessly throws out the appropriation of $500,000 asked by the Navy Department.

It may perhaps be roughly estimated that the completion of docks and drydocks, with all the requisites of a great naval station, will cost from ten to fifteen million of dollars, with several years of labor, equal perhaps to the cost and time of making two battle ships. And besides this will be the completion of a larger entrance channel, and clearing of all obstacles to internal navigation, which may cost two or three hundred thousand more. What the necessary fortifications will cost one has no means of guessing—probably no inordinate amount. That subject has been studied by the proper department, and undoubtedly very complete plans exist—to be preserved with the usual secrecy. As before suggested, those defenses will probably consist chiefly of masked batteries arranged along the low sandy coast within the fringing reef, whose edge lies one mile at sea.

There may perhaps have to be considered a defense against a formal attempt to capture the port by a combined army and navy, in order to hold possession of the Hawaiian group, and so to permanently control this ocean. To resist such an attempt would require an adequate military force, and probably suitable batteries mounted on the slopes to the northward, where the land attack must be made, that being the only direction whence a landing force could well operate. It might be possible for an invading enemy to land upon the Waialua coast, twenty miles to the northward, making its way across the low and rather smooth divide of 900 feet altitude. But any such operation would necessitate a strong military and naval expedition, coming either 2,500 miles from British Columbia or 4,000 miles from Japan. Such expeditions would be extremely costly and uncertain of profitable result. If adequately armed against direct naval attack on its front, Pearl Harbor might be deemed practically secure.

On what ground, it will be asked, is it asserted that Hawaii, with its great harbor, constitutes the one strategic point giving maritime control of the North Pacific and makes secure the defense of the Pacific Coast? One reason is this: Hawaii, solitary and alone, occupies the one mid-ocean position off the American coast from which our Western ports can possibly be attacked by a foreign enemy. For the necessities of coaling and supply such a position must be within a few days' steaming of the point of attack. It is obvious that San Francisco could not be attacked directly from the remote Asiatic ports, because the war ships would exhaust their coal before reaching our coasts. But Hawaii, if held by the enemy, would be a convenient point from which to attack, being within six days' easy steaming.

There is no intermediate supply port on either side. The nearest Asiatic port is distant fifteen days' steaming from our Pacific Coast. Hawaii absolutely controls the situation on the West. Held by an enemy it fatally imperils America. Held by the United States, it is of more value for defense than a whole navy of battle ships and cruisers. Pearl Harbor, once well furnished with naval facilities and made impregnable, renders its owner the complete mistress of the North Pacific against enemies.

Offensively, again, as a center of naval activity in time of war, the solitary and central position of Hawaii far in mid-ocean endows it with a unique power of attack upon all commercial and naval operations traversing the Pacific north of the equator. That region of the ocean is soon to become the field of probably the largest commerce of the globe. It will consequently tend also to become the region of corresponding naval activity in times of war. But, by its position, Hawaii can rule the whole North Pacific; and thus, for attack as well as defense, the owner of an impregnable Pearl Harbor becomes absolute mistress of the North Pacific.

We have barely alluded to what must soon become the leading feature of the commerce of the North Pacific, and thus has a powerful bearing upon this subject. That is the opening in the near future of the Panama Canal and its trans-Pacific traffic. Within less than ten years, through this new commercial gateway, there must begin to stream an enormous traffic, which will transform the commerce of the Pacific, and with it the future of Hawaii. It will be the traffic between China and Japan on the one side and the Atlantic ports of Europe and America on the other. This will be largely diverted from the Suez Canal to that of Panama. Both parties to the trade are enormously populous and highly civilized and productive. The traffic will grow to unprecedented magnitude. It may well be estimated that soon there will be crossing the Pacific from 200 to 300 steamships a month, counting those passing each way.

To how many persons has the obvious fact occurred that every one of those steamers will be absolutely necessitated to call at Hawaii for coal to continue her voyage? Hawaii is equidistant between Panama and Asia, about nine or ten days steaming from either end. And it is the only mid-station. No other one is possible. Hawaii holds the absolute monopoly of the Panama traffic across the Pacific. Every one of those many hundred steamers monthly must be the humble guest of Hawaii for the possibilities of continuing her voyage.

But the little port of Honolulu cannot

possibly accommodate a third part of that enormous business. The great majority must find space in the ample areas of Pearl Harbor. There will be an average of from seven to ten ships a day calling for coal, often fifteen to twenty at once. Besides those, will be the great fleets of sailing colliers required to supply them. These would average ten days in port, often fifty present at once, a nice crowd even for Pearl Harbor. And all this will be only the beginning of a growing stream of commerce for Hawaii to care for.

It is plain that there is urgent call for immediate diligence and activity on the part of the Federal Government to make Pearl Harbor ready for that great inception of commerce for which they are hurrying to open the Panama gateway. For such a commerce the harbor must be thoroughly opened and cleared. It must be set off into suitable divisions, and put in order for the activities of private mercantile enterprise. And it must have been completely protected and fortified before the canal is opened, as well as furnished with the proper naval arrangements and ample dockyards. America is opening a grand new roadway. She must hasten to build and fit up her great hotel midway of the route.

The contingencies of the near future contain most menacing possibilities. Japan has already developed a formidable sea power. She has undertaken, in self-defense, to drive Russia from the Pacific. In order to effectuate this object it seems inevitable that she will draw to her aid the colossal resources of still slumbering China. It behooves America early and thoroughly to forestall the dangerous possibilities of such a conjunction, and at once to make secure her own great sea power.

HON. LEI'U, HAWAIIAN ISLANDS.

Why I Went to Prison

BY ARTHUR LYNCH, M.P.

[It will be recalled that Arthur Lynch was the correspondent of THE INDEPENDENT while serving on the side of the Boers against the English army in South Africa. When the war ended he was elected to Parliament from an Irish Home Rule constituency, but on reaching England was arrested and condemned for treason.—EDITOR.]

A MAN who has been sentenced to death, and who has endured solitary confinement for a year, has certain advantages, for he can review his own career as something past and gone, and he can take up his own deepest guiding lines once more like one who has been born again. He sees things in truer perspective than ever, and he knows the relative value of his acts.

And so I think that the philosopher in his lonely musings, plunged into that solitude that sounds the inmost fibers of his soul, must after all find pleasure only in the souvenir of all that he has done in accordance with his ideals, the veritable expression of his own nature. Not necessarily, indeed, that this contemplation may have an ascetic aspect, or strained cast in any style or fashion. On the contrary, I think that the true philosopher is rather one who is keenly alive to a great variety of the forms of life, and who sympathizes with each in its own quality. And he may feel a satisfaction not only in his former toils in the rarefied air of metaphysics, the profoundly fascinating search involved in the analyses of mathematics, but also in the bold displays in the ruder arena of politics, in the delight of poetic movements, in the remembrance of feats on the running track, or of the honeyed kisses once robbed from pouting lips—provided, of course, that the laws of altruism were held in all due regard. Such is the apologia with which I beg to present myself again, in as objective a light as possible, to American readers; for I feel so many strong ties of friendship to the United States and to its citizens that some candid account of my own doings appears to be at this stage a sort of "categorical imperative."

I have read so many extraordinary accounts of myself within the last two or

three years that I have begun to wonder if all history is written in that style; and if this pretentious study be really worse than worthless, as giving a false impression of the forces that move the human soul and influence the development of the body politic. If a man were to lay bare his own mind, sincerely and without after thought, how different it would appear to the fantastic impressions of the world, and especially how clear, how inevitable, would seem the working out of his career.

I have been accused of Anglophobia; that is a cheap weapon in the turmoil of party politics, and it is particularly useful for inciting the passions of the mob. However I do not think I have been afflicted with Anglophobia, altho I have opposed even with the utmost violence the designs of a Tory Government in South Africa. I put into one form of protest that sense of the monstrous injustice of a war of aggression which Herbert Spencer, an Englishman of Englishmen, and one of the profoundest thinkers of all times, expressed in some of his latest writings with tremendous force, in words that should call the nation to pause and consider. So far from being actuated by Anglophobia, I have the greatest respect for the best qualities of the English character; and from Shakespeare and Milton to Darwin and Spencer I count with admiration the number of English poets and English men of science who have influenced the development of my thoughts. I will only note, in passing, that most of them have in their lifetime suffered persecution at the hands of their fellow countrymen.

And looking at the matter closely, so far from being unduly warped by my prejudices, my appreciation of English fair play, at least, I find to have been rather absurdly exaggerated, in view of the meanness of the stories invented in certain sections of the English press in order to misrepresent my own character. I will not insist on this matter, for I am aware that in America it was not only I who was placed on trial, but also that Jingo Party which was responsible for the war in South Africa, and which for the time rules public opinion in England.

Could the ordeal of the court have laid bare the innermost motives that influenced me so that the world might read my very soul, and at the same time have exposed to the light of day the nature of the interests that led to the war, and the passions of the men who urged it on—that is, indeed, the trial that I would have hailed with delight.

I fought in South Africa mainly to preserve the Republics. The idea which animated me after I had taken up arms was that with a small and mobile force we could make a dash for Cape Town, chase out the former Government, and, proclaiming the federation of the various communities under the title of the United States of South Africa, enrol the citizens as a regular force. Cape Town was certainly not the best objective from a strategic point of view, but the moral effect of such a move would have been decisive.

In this, however, there was in my mind no sense of high treason; rather my political acts have been the outcome of unswerving fidelity to my own ideals. At the period when I left Australia I was in favor of setting up an independent republic there also. During my absence from Australia I lived for the greater part of my life in France, and I thought at the time I reached South Africa that I was free even from any kind of technical connection with England. Certain of these matters I did not bring out before the Court, for I was advised that my trial in London, instead of Australia, was a breach of the Treaty of Peace, and in any case I regarded the matter as a foregone conclusion.

Of course, my connection with Irish affairs had not been without influence in my decision to fight for the republics, and I believe also that, in a small way, even my violent acts have been helpful toward bettering the political condition of Ireland. Since I first began to take interest in Irish matters I have seen various efforts on the part of England tending toward an improvement of relations between the two countries, and some of these have involved large financial concessions. But either these represented rights previously withheld from Ireland by virtue of superior force, or else English statesmen have weakly yielded to Irish agitation and violence to the detriment of their own country. Of

course, the first of these hypotheses is correct, but either of them affords a scathing criticism of the treatment of Ireland and the justification of Irish political methods.

After the conclusion of the South African war the leaders of the Boers in signing the terms of peace declared themselves prepared to abide by the spirit as well as the letter of the conditions proposed. Most of the prominent English statesmen, including the Premier, delivered conciliatory speeches, of which the burden was to "let bygones be bygones." Your own President, under circumstances somewhat similar, not only uttered words of that kind, but gave them the most effective sanction by proclaiming a general amnesty. But then I have always considered that if there were a man of the caliber of President Roosevelt in the position of Prime Minister of England, or Chief Secretary for Ireland, the great problem of the relation between the two countries would be solved in three months, and we should be able to say, adapting Gambetta, There is no Irish Question; there are only Irish questions. The English Cabinet, however, destroyed in large measure the good effects of their first conciliatory speeches by keeping alive certain affairs not particularly important in themselves, but full of the matters which especially are productive of ill-feeling, and the memory of rancors, in which England certainly has nothing to gain.

The Lord Chief Justice "tuned" the press, to borrow a phrase of Queen Elizabeth, by a charge to the Grand Jury, and Justice Wills, in passing sentence of death, delivered a bitter tho somewhat incoherent political harangue. But it may be asked, Why did I deliver myself to trial at all? The only answer I can give is that, having allowed myself to be elected to Parliament by the city of Galway, I felt that the duty thereby imposed on me demanded that I should proceed to England regardless of all possible consequences.

Nor was there anything inconsistent in allowing myself to be elected. New situations had been created by the events of the war, and many political theories had been probed to the bottom. I had full reason to disbelieve in "physical force" in Ireland; the Empire itself had become a new thing; I had not ceased to be a Republican, but I was no longer a Revolutionist, I was an Evolutionist. My hope, then, as, indeed, now, was to behold a fund of truly liberal ideas gradually infiltrating through the masses of the various almost independent states that form the Empire, so that our development may tend on this grand scale to Republican forms. In many respects I hope still to see the United States of America taken as a model.

At a subsequent period I may touch on matters to which I gave thought during my imprisonment. I was kept for twelve months in solitary confinement, with insufficient nourishment, and in a darkened cell; but I have now thrown off the effects of such a monstrous *régime*.

My solitude, even with the deprivation of writing material, and with a limited choice of books, was yet devoted to study; and in that respect I am almost inclined to bless my hardships. Many lines of thought in which I had worked for twenty years became clearer, and I hope to develop the scheme of studies which had the potent charm of making me oblivious to my surroundings and of sustaining me by great hopes and the vision of noble ideals.

LONDON, ENGLAND.

Literature

Landor's The Gems of the East*

Some excuse might be found for the writers who, a few years back, under the stress of American demand for information about the Philippine Islands and the great lack of any comprehensive writings upon them in the English language, put forth hasty treatises, full of the inevitable errors of such works, and betraying a very inadequate knowledge of the mass of material that has been published on the Philippines in Spanish and other languages. But now, after six years of American occupation of the islands, during which our magazines and newspapers have continually been publishing descriptive bits about the islands and their people from every other soldier and school teacher over there, when several hundred books and Government documents have appeared on the political phases of the situation under United States rule, and at the very time when the Library of Congress is furnishing us with fairly complete bibliographical lists giving some idea of the enormous mass of Philippine literature, it surely requires "nerve" (to use an Americanism ridiculed by the English) for this Englishman to foist off upon the American public an expensive 550-page book which purports to reveal to them the Philippine Islands, and which instead reveals the almost complete ignorance of its author of the bibliography already accumulated in this line, as well as a most amazing personal conceit.

One would imagine, from Mr. Landor's constant surprise at the wonderful things he found himself doing and his constant efforts properly to impress his readers with the marvels of his "discoveries," that he never heard that Magellan discovered the Philippine Islands in 1521, and that white men have (not very diligently, to be sure) investigated every part of them during the past three centuries. For a year or two after the extension of American rule throughout the archipelago discharged soldiers who turned prospectors used to amuse themselves with thinking they had been "where no white man had ever trod before," but that sort of tale was laughed out of court in the Manila saloons, where they rendezvous, long, long since; it is amazing to find a so-called "explorer," who makes serious claims to the attention of scientists, perpetrating them in this self-complacent form now. They would not "go" any longer, even as Sunday "feature-stories" for the decidedly "yellow" American newspapers in Manila.

Mr. Landor, as a matter of fact, made a most helter-skelter journey through the archipelago, merely skimming the outer edges of some of the lesser known sections, where the accurate knowledge recorded about the strange inhabitants is limited, and where some careful field-work, performed in a really scientific spirit by a real scientist, would have been well worth the while. His work, while it may make the unskillful gape at times, if his stories do not merely serve to arouse skepticism, must invite only contempt in the mind of the man who knows something about the peoples and the places he visited, and, what is almost as important, something about the accumulated literature on the Philippines. Mr. Landor evidently never took the trouble to read anything on the Philippines, except some few books on the gazetteer order, which have stood him in good stead to furnish very erroneous, but minute, descriptions of places which he never saw, such descriptions being inserted, it would appear, to bear out the claim that this is "the most complete work on the topography, ethnology, civil and political conditions of the islands today."

To catalog merely a few of the more noticeable among the multifarious errors in the line of anthropology and ethnology, we note such misleading and inaccurate statements as those on page 2 about "white tribes of tree-dwellers" and a "multitude of tribes" addicted to

* The Gems of the East. (*The Philippines.*) *By A. Henry Savage Landor.* New York: Harper & Brothers. $4.00 net.

cannibalism, when it not only is not known that there is cannibalism in any part of the Philippines, but is not even assured authoritatively as yet that there are human sacrifices of a ceremonial character; and the strange statement, for an anthropologist, that the Tagbanuas have "wavy" hair, as well as a confusion of the lank hair of the Sámals (Malays) with the typically kinky hair of the Negritos (p. 370). The author finds (p. 364) that the Atás, one of the lighest and most delicate-featured tribes of the so-called "Indonesians" (probably, after all, Malays), "have undoubtedly Negrito characteristics." This raises a query as to what people could have been pointed out to him in his hasty scramble through Mindanao as being Atás. The state of his misconception as to Philippine dialects is indicated in his declaration (p. 59) that the dialect of Cuyo has no verbs. It will surprise some scientific men to find that, "varying with the altitude," the pulse-beats of the mountaineers of Northern Luzon ran from 68 to 92, while he gives the Tingian men a pulse of 100 and their women a rate of only 66. The Gaddanes he calls a tribe "now civilized and Christianized," which will be news to most of their neighbors in the lowlands of the Kagayan Valley (p. 428). The majority of the "Bayo" Igorots, he says (p. 499), are under four feet in hight, which is not even true of the Negrito dwarfs.

Among helter-skelter "scientific" observations in other lines we find (p. 120) that the *ipil,* the hardest wood of the Philippines, which will sink in water almost like iron, will ruin an ordinary saw and can be of use only in big timbers for wharves, piles, etc., is "porous" and is used largely for building purposes. Similarly, we are told (p. 240) that gutta percha is produced on Tawi-tawi from the *Ficus elástica,* a plant entirely distinct botanically, and which produces rubber, something with widely different characteristics from those of gutta. He says (p. 69): "Possibly the lepers [in all the archipelago] may amount to a few hundreds," unaware that an incomplete census taken locally throughout the civilized provinces showed some 3,500 lepers, and a fair estimate of their number is 5,000 or 6,000, which is much below the former Spanish estimates, at that. The remark (p. 197) that Mohammedan missionaries came to the Philippines "even as early as 1773" may be believed; they were there certainly some years, perhaps several centuries, before Magellan arrived in 1521.

Practical Religion

THERE are great numbers of books which do not pretend to set forth new results in biblical or theological science, but undertake to apply truths and facts worked out by others to the problems of every-day living. There is a field for such books, and to bring a really vital message of the help of God for human life is to do good work, however dependent the worker may be on the researches and results of other men. An excellent example of a good book on practical religion is *The Enlargement of Life,** by the pastor of the "Old Church on the Hill," at Lenox, Mass. Mr. Lynch aims to "bring eternal satisfactions to human needs," and his work will appeal to earnest men who are willing to make their theology somewhat broad. He does not hesitate to deny the doctrine of eternal punishment, tho he does not discuss many debated questions, and declares "it is better to hold one, great, life-giving truth in magnificent positiveness than to hold half a dozen debatable articles of faith."

Few would look under the title *Fratribus*† for a series of straightforward, common sense, and really up to date sermons to boys. But that is the character of the addresses that make up *Fratribus,* and the explanation is that Mr. Bramston has learned that good sermons to boys must not be learned essays, nor efforts to "preach down to their supposed level," but talks to brothers, by one whom they will feel to be αθηςόμοιοπ with themselves. Whatever the theory, these addresses to "Wykehamists," with the flavor of "Wykehamical" life about them, are excellent, and William of Wykeham ought now to be fully satisfied with the pains he

* THE ENLARGEMENT OF LIFE. *By Frederick Lynch.* New York: G. P. Putnam's Sons. $1.00.

† FRATRIBUS: *Sermons Preached Mainly in Winchester College Chapel. By John Trant Bramston, M.A.* London: Edward Arnold. $2.00.

took to found that Academy at Winchester.

Dr. Ide‡ is better on practical problems than in his efforts at theology, better on the "Neglected Christian Duty" of humor than on "Miracles from the Standpoint of To-Day." But the last address in his book on "An ever-expanding theology" shows that the root of the matter is in him and does much to make up for such statements as, "The pre-existence of Christ is the foundation stone upon which rests the belief in his divinity."

Mr. Jackson is a close disciple of Professor Stevens, whose New Testament Theology he has followed in his preparation of these addresses on *The Teaching of Jesus.*§ Second-hand studies are never thoroughly satisfactory, yet there is a grip on life problems and a religious enthusiasm in these addresses that give them a value of their own.

If any one thinks the Catholic Church in America has no men of delicate religious feeling and of finely spiritual nature, let him read a few pages of Bishop Spaulding's *Glimpses of Truth.*‖ It scarcely matters what pages are chosen, for it is a book of aphorisms, without attempt at logical sequence. It is filled with wise and penetrative sayings, tolerant and optimistic in spirit, on all manner of subjects that have to do with the deeper side of life. Many such as this could be taken at random: "If thou exalt thyself thou compellest remembrance of the hideousness of thy baser nature: but if thou art reverent, mild and helpful, the wise and the good will think only of thy heavenly descent and destiny." (P. 34f.)

These "Confessions of a Preacher"¶ narrate the progress of a soul to faith by learning to rely on the authority of the soul and the facts of experience. Many cannot be satisfied with a faith which declares the bodily resurrection of Jesus a belief of no significance, but in this book, which confesses such a faith, the heart of Christianity seems to be present nevertheless.

A Plea for Industrial Peace

WITH both employers and employees strengthening their forces for an impending conflict, a plea for industrial peace is timely, and ought to receive general attention. Such a plea is Dr. Gilman's*—an earnest and sincere argument, supported by a great wealth of data, the gleanings of many years of study of social problems. Yet for all its excellences we are doubtful if it will greatly advance the cause of permanent industrial peace.

There might, indeed, be produced a momentary semblance of peace and order on the lines laid down by Dr. Gilman, but it would be very like the order which reigned in Warsaw on a famous occasion. It would be order secured by the complete suppression of one of the two parties to the controversy. In this case the eliminated party would be organized labor. Despite the author's cordial praise of collective bargaining, he has even warmer praise for the open shop, and he urges employers to make their fight along that line. But the open shop, in the opinion of those most interested, means practically the end of collective bargaining, for it renders the union powerless to enforce the terms of a bargain.

Very naïve, to say the least, is the author's declaration (p. 236) regarding the demand for strictly union shops. This demand would appear to be "a virtual confession by the unionist that he has not perserverance enough to convert the non-unionist." Quite as obvious must it have appeared to the men of the South during the Civil War that the arrest and deportation of Vallandigham was a virtual confession that the Lincoln administration "did not have perseverance enough to convert" Copperheads. Exhortation of the unconverted has doubtless its fitting place in industry, as well as in religion and civil government, but there are certain contingencies in which

* METHODS OF INDUSTRIAL PEACE. *By Nicholas Paine Gilman.* New York: Houghton, Mifflin & Co. $1.60 net.

it must necessarily give place to compulsion.

Dr. Gilman, like his colleagues, has much to say of the tyranny of the trade union, and he quotes with approval the declaration of the Anthracite Coal Strike Commission on the sacred "right to work." He has also some illuminating remarks on the subject of boycotts and blacklists. He is rather skeptical about the blacklist, doubting if it is really employed, tho he concedes, on the authority of Professor Ely and Mr. John Graham Brooks, that it may once have been common. Still, it does not appear to be a very wicked thing. "When the trade unionists," he writes (p. 268-9), "would strictly prevent the employer from communicating to any other employer in his line of business the fact that a man who has left his employ was active in a recent strike, they seem to occupy untenable ground." The boycott, on the other hand, tho in its simple form it is conceded to be both "natural and defensible," is in its "compound" form detestable persecution (p. 275). Discrimination as practiced by the trading class would thus appear to be a far different thing from that practiced by the working class.

One cannot easily follow the line of reasoning which this book develops. The strange part of it is the sincerity with which a partisan view is everywhere advanced under the delusion that it is an impartial view. To suppose that collective bargaining will become more common under the changes which Dr. Gilman advocates is to expect water to run uphill and gravitation to repel. To deny organization of the shops, thereby annihilating the power to bargain collectively; to compel the incorporation of those who band together, thereby putting them completely at the mercy of those who have greater resources for litigation, and finally to forbid collective discrimination against employers deemed to be unfair, may, indeed, be held by certain persons to be both wise and necessary. But to hold at the same time that by effecting those reforms collective bargaining will be increased, and that permanent industrial peace will be fostered, is to expect sunshine to be extracted from cucumbers.

The First of Empires. "Babylon of the Bible" in the light of latest research. By W. St. Chad Boscawen. New York: Harper & Bros.

Mr. Boscawen has been for many years a student and lecturer on Babylonian and Assyrian topics, and is the author of several volumes on the subject. He has given us here another work, the purpose of which is to present the history, manners and art of Babylonia down to a period a century or two later than Hammurabi, under whom the empire was consolidated. Mr. Boscawen does not regard Hammurabi as being the Amraphel of Genesis, but identifies that king With Hammurabi's father, Sin-muballit, whose name might be read *Amar-pal.* From this book, which is somewhat freely illustrated, the reader can get a very good idea of the character of this first of empires. Much valuable information will be gained by a reader not an expert. Altho the book has not the fullness or the scholarly character of Maspero's "Dawn of Civilization," neither is it as expensive. The trained student of the subject will observe a multitude of little errors, largely of spelling, the list of which would fill the page. We have repeatedly "Yaveh" and "Yahavist," "De Candole" for *De Candolle,* "Schiel" for *Scheil;* we have "Rimnion" and "Rimman" for *Rimmon,* "Lacish" for *Lachish,* "Sabionism" for *Sabaism,* "Ammanus" for *Amanus,* "Sharien" for *Sharein,* "Pinchas" for *Pinches,* and many other such. On some important points, such as the very early date of Sargon I, we should differ from Mr. Boscawen, but we only note some minor errors of statement, such as that Professor Haupt is a European scholar; that El Oheimar ("Oiehmar," p. 121) is a "mound of great size" "southeast of Hillah," and the site of Kish; that on the Stele of Vultures the king's chariot is "drawn by asses;" that the site of Agade is "not known;" a figure of the water-god Ea, as shown by Heuzey, is described as "Gilgamesh and the pilot," and we notice that the same seal, differently drawn and described, is figured on p. 100 and p. 279. Yet, bearing such evidences of haste, we are glad that a book which gives so fair a view of the earliest known history of the world, and which transcribes a number of important and ancient hymns and

myths, as well as the Code of Hammurabi, should be offered to the general reader.

Recollections of a Royal Academician. By John Callcott Horsley, R.A. Edited by Mrs. Edmund Helps. With illustrations from the author's drawings and pictures. New York: E. P. Dutton & Co. $3.00.

For eighty-seven years John Callcott Horsley lived an easy and a happy life in an atmosphere of the best culture of Victorian England; a life almost exactly contemporaneous with that of the Queen. Becoming an art student when a lad of thirteen, at fifteen he was a probationer and prize winner at the Royal Academy schools. When he was sixteen one of two portraits sent by him to the Academy exhibition was rejected by the Hanging Committee; but in the seventy remaining years of his life that disappointment was never his again. He never had to struggle for recognition and success; indeed, his pictures were greatly overvalued. Years ago he headed a crusade against painting from the nude, and gained thereby no little notoriety. *Punch* promptly nicknamed him "Clothes-Horsley," and it seemed for long that his likeliest title to fame would be the slight one of being the butt of a Whistler witticism. That deft handler of the brush and caustic wielder of the pen exhibited one of his own studies from the nude with the inscription: "*Horsley soit qui mal y pense.*" In his recollections Horsley found himself. He deserves to be remembered for the many excellent anecdotes he tells. These chapters were dictated by him in the course of his last year, when, the sympathetic editor tells us, present-day events were little realized by him, and, perhaps, forgotten the next hour, tho he had an avid memory for the happenings of fifty or sixty years ago. They are surprisingly kindly and simple in tone, genial and free from any critical attitude. He tells his little stories for their own sake, and therein lies the freshness and charm of his book. Queen Victoria, the Duke of Wellington, Thomas Moore, Mendelssohn, Turner, Vernet, Landseer, Lord Leighton, Faraday, Huxley, Dickens, the Kembles—these are only a few of the great ones seen in passing in his pages. While nothing of importance is added to the sum of the world's knowledge, the glimpses at these notables make pleasant and entertaining reading.

Dictionary of Historical Allusions. By Thomas Benfield Harbottle. New York: E. P. Dutton & Co. $2.00 net.

The purpose of this book is excellent. Greater pains, however, should have been taken with the execution, particularly in regard to American allusions. John Brown's raid on Harper's Ferry, for instance, is set down ten years out of date. For some unexplained reason "gerrymander" is spelled with an initial "j." The statement that Tammany "remained in power [from 1874] until 1902," is subject to a number of exceptions. The statement that Blaine received his nickname of the "Tattooed Man" from the cartoon representing him "As Phryne Before Her Judges" is a mistake. The nickname arose from an earlier cartoon, in which he was represented as one of the figures in the National Political Museum. Dorr's Rebellion is placed in 1841 instead of 1842. Virginia is curiously numbered among the "Border States." The War of 1812 is called "The War of 1811." McClellan was not "driven back to the James River" during the seven days' battles. The more important engagements occurred while he was transferring his base from the Chickahominy to the James. The Missouri Compromise was passed in March, 1820, and not 1821. The statement, furthermore, that it ordained that slavery should be lawful only in territory "south of 36° 30′ north latitude" needs the important qualification of "excepting Missouri." Finally the statement that the Know-Nothing party was formed in 1855 is inexcusably wrong. A Native American party polled some 9,000 votes in the New York municipal election of 1835. A general organization seems to have been formed as early as 1843. Under the name the "American party," it was again organized in 1852, and the name "Know-Nothing" dates from this time, or perhaps earlier. It was in 1855 that it discarded its secret machinery. Most of the American allusions, we are sorry to say, need revision.

Evelyn Byrd. By George Cary Eggleston. Boston: D. Lothrop. $1.50.

"Evelyn Byrd" is third of a series of Southern novels by Mr. Eggleston, all dealing with periods preceding and during the Civil War. Mr. Eggleston writes from a Southern point of view, but without prejudice. The enjoyment of the writer in his work titillates all through, an attitude of the author that rouses pleasurable sympathy in the reader, tho it may not augment the artistic worth of the work. Such a writer is like the *raconteur* who does his laughing before he tells his joke. Mr. Eggleston requires much assistance of his paper people; quite a third of his romance is put into their hands. Dorothy and Arthur Brent (whom we have met in former volumes) tell much of the progress of events in letters to each other, while Evelyn Byrd has not only to suffer many things of many men and of untoward circumstances, but has to tell of all that befell her in an apparently very hastily written book—clumsy handling a book within a book. Mr. Eggleston goes needlessly afield to explain slight idiosyncrasies of speech and of education in his heroine. The frequent use of the intensive "do" and "did," the bad French, the familiarity with "Jane Shore," "Kate Hardcastle," "Lady Teazle" of Evelyn Byrd are not unusual with the Southern girl. "I do love," "I did enjoy," "I do hate," are usual expressions with her. The two stout old volumes, "British Drama," are to be found in almost every good home library of the South. Almost any girl there browsing can tell more of triumphs of Mrs. Siddons and Miss O'Neil in chief rôles of those dramas than of laurels lately won in plays of Rostand, Zangwill or Mr. Fitch by Miss Adams, Miss Robson or Maxine Elliott. Evelyn Byrd is an unusually attractive young woman. A good hearty story, whose very crudities attract like the wholesome roughness of an excellent touchstone.

The Bright Face of Danger. By R. N Stephens. Boston: L. C. Page & Co. $1.50.

If the jealous husband in the tale keeps his wife locked up in a tower, we may always infer two things, first, that it is an historical romance, because few jealous husbands nowadays have family towers in which to place their coquettish spouses, even if the remedy met the exigencies of the situation; second, that soon or late a lover will appear beneath the lady's window looking for "the bright face of danger." And he generally finds it, especially if the husband and villain discover him there. No matter how innocent the lady is, fights, robbery and rope ladders follow. She becomes the happy victim of circumstance. No moral odium attaches to her for being snatched away. And the most ethical modern reader finds himself rejoicing immorally at the discomfiture of the wicked husband. In this particular romance the whole action takes place within a few days. There has scarcely been a more rapidly moving story, indeed, since Miss Bertha Runkle electrified the literary world with her masterpiece of blood and bombast, "The Helmet of Navarre." Such stories, for some inexplicable reason, are absurdly interesting. Reading them has the same exhilarating effect upon the imagination that riding "the cock horse to Banbury cross" had in our infancy.

Leonardo da Vinci. By Edward McCurdy, M.A. London: George Bell & Sons. Imported by the Macmillan Co. $1.75.

The newest volume in the Messrs. Bell's "Great Masters in Painting and Sculpture" series, devoted to Leonardo da Vinci, is chiefly to be commended for its excellent illustrations. These include most of Leonardo's pictures and several of his drawings in satisfactory half-tones and a good photogravure of the "Mona Lisa" as a frontispiece. Mr. McCurdy narrates the facts of the painter's career clearly, succinctly, safely, giving the precise authority of the records for every statement; but does it in such a matter-of-fact way that his monograph makes very dry reading. Never does he permit himself one thrill of enthusiasm over the wonderful achievements of the great Florentine. Leonardo is the one artist of whom it may be said "with perfect literalness," to quote Mr. Berenson, "Nothing that he touched but turned into a thing of eternal beauty." But in all Mr. McCurdy's array of facts there is no hint of that one. In following

Morelli into the uncharted and difficult regions of connoisseurship the author becomes too dogmatic. In short, instead of a fascinating study, such as might legitimately be looked for from the subject and in a designedly "popular" series, this is a dull book. Yet it is a useful one, too, for its bringing together into handy compass of the main facts about Leonardo and his art work, for its good index, for a selected bibliography and for its pictures.

The Government of Wyoming. By Grace Raymond Hebard. San Francisco: The Whitaker & Ray Company.

The Constitution of Wyoming is of especial interest to all students of politics on account of several very radical features which it embodies. The women of the State have had the suffrage and equal property and personal rights for thirty-five years, and Wyoming was also the first State to adopt the far-reaching policy of assuming State ownership of all the water supply without which the land is useless. Dr. Hebard is well qualified by her position and wide personal knowledge of State affairs to tell of the history and administration of Wyoming as she has done in this little book.

Studies in Shakespeare. By J. Churton Collins New York: E. P. Dutton & Co. $2.00.

A collection of essays on Shakespeare as a classical writer, as a prose writer, as a lawyer, and so on—all mainly designed to show that the poet had an astonishing amount of erudition, and, incidentally, to deepen the mystery of his being—provided one accepts all the coincidences and parallels here set down. As usual in such cases, the author proves too much. With the stories in Ovid, it is perhaps not unreasonable to assume even a Warwickshire school boy to have had some acquaintance; but when it comes to asserting that "Shakespeare must have read Plautus in the original," also Lucretius, also St. Augustine's *De Civitate Dei;* also the Greek classics, tho perhaps only in the Latin versions—and, in fact, was "haunted with reminiscences of the Orestes and Phœnissæ," one is apt to pass from mild skepticism to lively intolerance. In the concluding essay (the Bacon-Shakespeare mania) the author empties whole buckets of wrath on the head of Judge Webb, whose "Mystery of William Shakespeare" he pronounces "the most noteworthy contribution which has yet been made to the Bacon-Shakespeare question," and then gets especially severe on Webb's parallels and analogies. And yet, without in the least committing ourselves to the "Baconians," candor compels us to remark that if Mr. Collins's parallels and analogies prove that Shakespeare acquired parts of "Romeo and Juliet" by reading epigrams of Marianus either in Greek or Latin, Judge Webb has established his case for Bacon, and is entitled to his decree, together with costs and disbursements.

Apologetics, or the Rational Vindication of Christianity. By Francis R. Beattie, D.D., LL.D. With an introduction by Benjamin B Warfield, D.D., LL.D. In three vols. Vol. I, Fundamental Apologetics. Richmond, Va.: The Presbyterian Committee of Publication. $2.00 net.

Dr. Beattie's view of Apologetics—for which he is commended by Dr. Warfield—is very comprehensive. Its threefold task is to prove the existence of God and set forth his relations to the world, to vindicate the Bible, and to exhibit the beneficent results of the Christian religion. To each of these themes Dr. Beattie proposes to devote a volume, and this first volume of 600 pages is concerned with the first division, belief in God. It treats mainly such large subjects as the origin and nature of religious belief, the proofs of the existence of God and antitheistic theories. Thus Apologetics is made to treat important themes usually considered under the head of systematic theology. The presuppositions of the Calvinistic theology are set forth with clearness, thoroughness and skill, and with sincere candor and frankness. But the author's exhaustive method does not allow him to reach, even in 600 pages, such pressing apologetical problems as the divinity of Christ, the immortality of the soul, or the inspiration of the Bible. Greek words appear without accents, tho the book is otherwise well printed.

The Book of School and College Sports. By Ralph Henry Barbour. New York: D Appleton & Co $1.75.

A thorough, reliable and comprehensive book giving the official rules of the games, the records, and practical directions for attaining proficiency, well illustrated by photography. Half the book is devoted to the two leading intercollegiate games, football and baseball, and the other chapters to track and field athletics, lacrosse, ice hockey and lawn tennis. Every high school library should have a copy.

The Flame Gatherers. By Margaret Horton Potter. New York: The Macmillan Co. $1.50.

In this story the old drama of love and repentance is given the mystic setting of ancient India. Extremes always meet; where sensuality and passion abound, asceticism follows like the long fast of a sin burdened soul. Accordingly the first half of this remarkable romance is an erotic interpretation of the fierce desert lover and his beautiful, but unlawful mistress. The peculiar significance of the story, however, is worked out in the latter half, where the souls of the two are united and live again, a mysterious duality, in the son of a heathen priest. The poppy-flowered, love-laden tale changes to an involuntary life-long pilgrimage after purification, under conditions so terrible as to be unendurable, except to an Eastern Mystic. The situations are well conceived, and the story is well written. The author's literary style is singularly versatile. From being almost salaciously suggestive in the beginning, it becomes simple, austere, unemotional toward the end like the vocabulary of prayers.

History of the Christian Church. By George H. Dryer, D.D. Cincinnati: Jennings & Pye. Five vols. $7.50.

A Church history designed for popular use and covering the entire period from the first century to the close of the nineteenth. It does not claim to be an original contribution, but the author has made good use of the best authorities, particularly those in German, and his work is what he aimed to make it, a readable and trustworthy popular account of the fortunes of Christianity during nineteen centuries. An unusual proportion of space is given to recent events, the last volume being devoted to the past one hundred years.

How to Get the Best Out of Books. By Richard Le Gallienne. New York: The Baker & Taylor Co. $1.25.

Mr. Le Gallienne has written a book for busy people; a literary Bädeker for the business man, who could ask for no more genial guide to the best in literature. The "best" for each man the author is inclined to define as that in which he takes most pleasure. "No reading does us any good that we do not enjoy." He impresses the reader with the necessity of forgetting "even more than he remembers." He thinks the end of true reading is the "development of individuality," rather than that of acquiring fragments of fact. We read too much —that is, too many books; "actually there is very little to read." Mr. Le Gallienne has a word for the realists, or "veritists," or whatever they wish us to call them:

> "The realism of the ugly is negative, the realism of the beautiful is positive; and for that reason the realism of the ugly is passing away; for man lives not by negatives alone, and no literature of negation and misanthropy can long continue to terrorize so human a world."

Unlike Sir Philip Burne-Jones, he sees a certain splendor in mere business buildings. The walls of Thebes were built to music, according to the old story; "the sky-scrapers of New York are soaring to music also, a masterful music of the future which not all can hear." Tolstoi, Meredith and Bjornson are selected as the three "great novelists" of our own day. We may quarrel with the choice, but we will all appreciate the pleasant and sensible discussion of their works, and those of other living novelists and poets. Stephen Phillips, "whose shoulders are rapidly broadening for one of the old mantles," is a case in point. "Arthur Hardy," whose "Passe Rose" is worth all the recent "historical" imitations rolled together, he sighs, with the rest of us: "If only Frank Norris had lived!" but the tone of the book is for the most part distinctly hopeful.

Literary Notes

"The Roosevelt Doctrine" (Robert Grier Cooke, New York, publisher) contains a large number of brief extracts from the President's messages and addresses conveniently arranged by topics, so one can in a moment find what he said on any particular subject.

....Dr. Stephen D. Peet, the editor of the *American Antiquarian* (Chicago), has published under the title of "Ancient Monuments and Ruined Cities" ($4.00) the fourth volume of his researches in prehistoric American antiquities. The fifth volume, now in preparation, will treat of "Myths and Symbols, or Aboriginal Religions."

....A chronological list of all the Spanish Governors of the Philippine Islands, from 1565 to 1899, furnishing in condensed form valuable information regarding each—the date and place of his birth, dignities held, arrival in the islands, term of office, important events therein, date of death, etc.—will appear in Volume XVII of "The Philippine Islands: 1493-1898" (A. H. Clark Company, Cleveland). No such list has yet appeared in any other publication, altho in some Spanish works there are biographical notices of the successive Governors up to the middle of the nineteenth century.

....White's Natural History of Selborne possesses a perennial charm which for more than a century has attracted nature-loving readers. Altho an old book, when reckoned by the years since its first publication (in 1789), it will never be old in the sense of being antiquated. It is always new and stimulating and suggestive, just as the landscape, the hills, the valleys, the brooks, the birds and the green vegetation are always new and interesting, as indeed they will be as long as the earth shall endure. A new edition by Grant Allen, illustrated by Edmund New, comes from the publisher, John Lane, New York. It is a worthy reproduction and illustration of this scientific classic.

....Messrs. T. Y. Crowell and Company have issued another volume of their "First Folio Edition" of Shakespeare—The Merchant of Venice. This excellent series offers in a convenient form and at a small price (50 cents a play) a text of Shakespeare identical in point of spelling and punctuation with the original edition of 1623, to which scholars are returning more and more, together with a general introduction, explanatory notes and variant readings from other sources. As a series, therefore, not only does it make a desirable edition of the dramas, but it is also particularly valuable to those who wish to make up their minds about the text for themselves and are unable to purchase variorums and the like expensive *hülfs mittel*.

Pebbles

"WHAT did you propose to her for, anyhow?" "Well, I couldn't think of anything else to say, and the silence was becoming appalling."—*Chicago Tribune.*

....FURTHER INFORMATION: "Now," said the teacher, "can you tell me anything about Hiawatha?" "Yes," replied little Henry, "it's the tune that made Longfellow famous."—*Chicago Record-Herald.*

....*The Professor:* "Humph! Dear me! I gave that young man two courses on the cultivation of the memory, and he's gone away and forgot to pay me, and I can't for the life of me remember the fellow's name. How very provoking!"—*New York Sun.*

...."How is your school of journalism doing?" "Well, it is a little slow. We have no trouble in getting people who are willing to be teachers. The trouble is to find anybody who doesn't think he knows all about how a newspaper ought to be run."—*Washington Star.*

...."Pretty tiresome, isn't it?" remarked the first man at a reception. "It is so," replied the other. "I'd sneak out if I could, but my wife would get mad. She's a friend of the hostess." "I'd sneak out, too, but my wife would be furious. She's the hostess."—*Philadelphia Press.*

....A DOLOROU$ APPEAL.—There is a little matter to which the "Me$$enger" beg$ to call the attention of $ome of it$ ubcriber$. We really hate to $peak of it, but $ome have $eemingly allowed it to $lip their mind$. To u$ thi$ i$ a very important i$$ue; in fact, it i$ nece$$ary in our bu$ine$$. We won't $peak further on the $ubject. Perhap$ you have gue$$ed the drift of our remark$.—*Mississippi Messenger.*

....An Irishman was called upon to give evidence in a shooting affray. "Did you see the shot fired?" asked the magistrate. "No, sor, but I heard it," replied the witness. "That is not satisfactory. Step down." As the Irishman turned to go, he laughed and was rebuked by the magistrate, who told him it was contempt of court. "Did yez see me laugh?" "No, but I heard you." "That is not satisfactory." And then the court laughed.—*Brooklyn Eagle.*

....Two young ladies on the promenade of a seaside resort had been watching the vessels pass through a telescope lent them by an "ancient mariner." On handing the glass back one of them remarked that it was a very good one. "Yes, miss," said the old tar, "that 'ere telescope was given me by Lord Nelson." "Good gracious! Why, Nelson has been dead nearly a hundred years." "Well, I'm blowed," replied the salty one, quite unabashed, "'ow the time do fly!"—*Woman's Home Companion.*

Editorials

Judge Parker's Views

THERE is much in Judge Parker's conservative and cautious speech of acceptance to which all honest and intelligent Republicans, as well as all other good American citizens, can readily subscribe. We refer to his expression of general and time-honored principles and beliefs relating to liberty, the rights of man, the supremacy of law, the elements and achievements and characteristics that have made the United States a "world power," the dangers of usurpation, the maintenance of "great military armaments," etc. With respect to a direct application of these principles to the existing Government and to what has taken place during the last few years, however —an application not made by Judge Parker, but one which he probably intended to suggest—there must be a sharp difference of opinion.

Has there been in the last four years any usurpation of the legislative or the judicial powers by the executive? We think not. Has the Government sought to make the people of the United States a military people, bent on conquest? Has it sought to maintain a "great military armament," or any armament except such "as may be necessary for the security of the country and the protection of the rights of its citizens at home or abroad?" We do not think so. Our army has been reduced, and surely is a small one. Our navy is not too large for the protection of American interests. Judge Parker's party platform calls for "the maintenance of the Monroe Doctrine in its full integrity." A competent navy is the best instrument for creating a wholesome respect for that Doctrine. The subcommittee of the Platform Committee at St. Louis agreed upon a resolution calling for "the maintenance and a liberal annual increase of the navy, as our best defense against a foreign foe, and a source of no possible danger to our liberties as a people." It should have been accepted.

Does Mr. Roosevelt or his party hold that "we must take part in the disputes and broils of foreign countries, and that, because we have grown great, we should intervene in every important question that arises in other parts of the world?" Not at all. If Judge Parker thinks they do, he has been misinformed. There is no evidence in support of such an assumption. But Mr. Roosevelt and his party do desire to protect the interests, commercial or other, of the United States and its citizens, whether these be in China, or Turkey, or the West Indies, or in South America, or on the seas; and the Government of the United States should be enabled by its people to do this effectively. The evils for the removal of which an application of the fundamental principles of our Government is presumably suggested in this address are imaginary. Mr. Roosevelt and his associates in the Government are not less devoted to those principles and to the Constitution than are Judge Parker and his friends. Especially is this true of the Fourteenth Amendment, as to which Judge Parker expresses the hope that we shall long "glory in it," altho he overlooks the failure of Southern Democrats to ask for that reduction of representation which the second section of it provides as a penalty for their violation of the Fifteenth Amendment.

In what he says about the Filipinos, Judge Parker is substantially in accord with Mr. Roosevelt and the Republican party, except that he would have the promise of ultimate self-government given now. There is in his address no echo of the fierce denunciation to which our military government in the islands has been subjected by leaders of his party. Indeed, it may fairly be said that he approves the policy recently pursued with respect to the Philippines. When he speaks of "taking away from them the right of trial by jury," of course he does not mean to say that the Filipinos ever exercised or possessed that right:

"The accident of war brought the Philippines into our possession, and we are not at liberty to disregard the responsibility which thus came to us; but that responsibility will be best sub-

served by preparing the islanders as rapidly as possible for self government and giving to them the assurances that it will come as soon as they are reasonably prepared for it."

This leaves no room for a partisan contest over the Philippines. We notice that his use of the word self-government, instead of the platform's "independence," has led prominent Democratic journals to ask for something more definite in the letter which he is to write.

Altho Judge Parker says that the entire platform is "admirable," his remarks about the tariff do not indicate his approval of the platform's assertion that "Protection is robbery." Being in favor of "a reasonable reduction" of the protective duties, he admits that, even if he should be elected, his party could not hope to revise the tariff during his term of office, unless the Senate, which is to have a Republican majority for four years, should consent and assist.

We recall the remark of Mr. Bryan, two days after the convention, that the nomination of Judge Parker had "virtually nullified the anti-Trust plank of the platform." The Judge, pointing out that combinations aiming at monopoly have been encouraged and stimulated by an excessive tariff, sees one remedy in that tariff revision which, as he admits, his party cannot make for at least four years to come. But "a complete legal remedy" for Trusts can be found, he asserts, in the common law. It may fairly be inferred from the context that he has in mind the common law when he says that the growth and power of the Trusts are due to the failure of officials to take the necessary procedure for procuring the judgments of the courts. He makes no promise to enforce the Federal Anti-Trust law, if he should be elected, but it may not be just to infer from anything he says that he would not do this.

Now, the platform calls for additional legislation on this subject, legislation withdrawing the privilege of interstate commerce from a Trust that monopolizes any branch of business or production. It also attacks transportation rebates and discrimination, and it asks that more power be given to the Interstate Commerce Commission. But what is needed, Judge Parker says, "is not so much other and different laws as officials having both the disposition and the courage to enforce existing law." Words that precede and others that follow indicate that he has in mind the common law, rather than the Federal statutes.

But we do not understand that it is feasible for the National Government, acting by the agency of its Department of Justice and its District Attorneys, to proceed against Trusts under what is called the common law. States and merely local authorities cannot be expected to deal effectively with great combinations of an interstate character and scope. We assume that Judge Parker, a candidate for the office to which the Department of Justice is subordinate, and discussing questions of national policy, had in mind not such action as purely local authorities might take, but such prosecutions as the National Government might begin and carry on, against the combinations called Trusts. And, as we have said, we do not understand that it is feasible for the National Government to invoke the common law for the prosecution and punishment of combinations. We hope that in his forthcoming letter Judge Parker will make his meaning clear and point out in what way the common law should be used by the Federal authorities. Other topics in the platform not touched in his address, but awaiting consideration in the letter, are the Panama Canal treaty, subsidies, reciprocity with Canada, "government by injunction," the direct election of Senators, civil service reform, and a demand for generous pension legislation.

Following an example set by Mr. Hayes in 1876, and by Mr. Bryan both in 1896 and in 1900, and repeating the arguments used by Mr. Cleveland in 1884, Judge Parker announces his determination to decline a renomination in 1908, if he should be elected in November next. The reasons given are good ones; but if by unwritten rule or by law a President should be permitted to hold office for only one term, that term should be six years instead of four.

It is shown by this speech of acceptance, so far as it goes, that those who ask for a revision of the tariff, for new legislation against Trusts and for a comprehensive enforcement of existing Federal laws against such combinations would gain little or nothing in the coming four years by the election of Judge Parker. Nor would there be any essen-

tial change in the Government's present policy concerning the Philippines. These are issues which the Democratic party in recent years has regarded as paramount. The real question for voters will be, which do you prefer, the man Roosevelt, with his own record and that of his party, or the man Parker, as disclosed by his creditable service on the bench, his two votes for Bryan, his telegram, and this speech of acceptance. With the telegram as his personal platform Judge Parker was a stronger candidate than he has been since the speech was made.

Lawlessness in Colorado

COLORADO is one of the noblest States in the Union, composed of honorable, well-behaved citizens; and yet, following the wild violence of Cœur d'Alene, Idaho, there has been in a small mining section of Colorado a succession of murders and deportations that disgrace the State and the country. We publish this week three articles, with three phases, or views, of the matter. One of them simply gives the fair experience of a very intelligent man we know, who, after completing a university course, tried for a while the experience of a workman in the mines. Another writer is in the fullest sympathy with the miners, and from his report one should understand that there has been no violence except by the self-appointed committee of citizens, which arrested and drove out of the State what they believed to be dangerous persons. According to him the Western Federation of Miners is responsible for no violence, but its members have been cruelly deported from their homes. He recognizes, however, that the overwhelming majority of the people approve the action which has crushed the Federation. A third writer, without recounting the acts of violence on either side, neither cataloging the murders nor approving the deportations, yet shows that his judgment is with the general sentiment of the State.

Two salient facts ought to be clear. The one is, that there has been an enormous amount of violence on the part of, or, at least, in behalf of, the miners' Federation. Such has been the case in Idaho and Montana during a period of years, and only of late has the Governor of Colorado resisted the control of the Federation. The massacre at Independence depot, by a bomb, when thirteen men were killed and seven maimed for life, stirred the people to indignation. Of course, we do not know, for the trials are not yet concluded, that it was the officers of the Western Federation who planned or incited these murders, but inasmuch as they were committed in its behalf the Federation was held responsible for them.

On the other hand, the methods employed to break up the Western Federation have been equally lawless. We have no present criticism to make of the action of Governor Peabody, and the highest court of the State has approved his action; but it seems to us clear that he has been in full sympathy with the Citizens' Committee, which has most unlawfully and violently expelled over two hundred men from the State. It was a case like the Vigilance Committee in San Francisco, or a later case in New Orleans, when the officers of the law were charged with incompetence and the people, *en masse*, assumed to rule. But it is not clear to us by any means that Governor Peabody and the courts were incapable of performing their duty. The Citizens' Commission was in session six weeks; it handled 1,569 cases. It dismissed 1,289 men against whom no charges were shown. It arrested 238 men, who were either charged with inciting violence, as members of the Federation, or who were otherwise disorderly and disreputable characters, and they were railroaded to Denver or out of the State, while 42 others were turned over to the officers of the law for prosecution of criminal charges in the courts.

It is beyond question that this is lawlessness, nothing less than anarchy. It was mob action. To be sure nobody was killed or physically injured, but their liberty was denied, and these men were driven from their homes, if homes they had. It is only the last resort of public safety that would justify such violence, and we do not see why the great State of Colorado should not have been able to control the situation under the forms of law; and if the Governor could not keep the peace, he was at full liberty to call on the President for the help of the army. It appears to us that there has been very bad business on both sides, on the one side vio-

lence and assassination, on the other violence and deportation, both lawless, both criminal. It is strange if under the methods of law the State and the nation cannot keep peace in three counties of Colorado.

May Women Vote in Church?

THE Representative Church Council of the Church of England seems to have a mission. It is discussing live subjects, very much like our Church Congresses.

This Council met for the first time last year, we believe. It was made up of six constituent bodies, each one of which had to give its consent to the organization of the central body. The two Convocations of Canterbury and York, under their Archbishops, are each composed of three Houses, the Bishops, the Clergy, and the elected members of the House of Laymen—six in all. They meet under the united presidency of the two Archbishops, and vote as a whole, or by Houses, when this is called for. We may say that such an organization is necessary to provide a central authority in the Church; and it will have a larger authority when the Church of England is disestablished, which may happen in ten years, with the succession of short Liberal Parliaments which we now expect.

We gave an account not long ago of the action of the Representative Church Council on the License Bill before Parliament, when the bishops by a good majority condemned the bill, in the interest of temperance, and the clergy and laymen approved it, in the interest of the brewers. We now consider its discussion of the right of suffrage of women in church meetings.

The organization of this Church Council is not yet settled. It has taken over much of the methods of the two Convocations of Canterbury and York. Under the prevailing custom women had a certain restricted right to vote for the lay members, but this was inadvertently removed in the new organization. A motion was made:

"That it is desirable that the initial franchise of lay electors should be extended so as not wholly to exclude women, and that the presidents be requested to appoint a committee to consider and report to the Council at their next sitting how this extension should be carried out."

It was not a motion that looked to the election of women as lay delegates; but only that they should have the initial franchise in the selection of lay delegates. It gave rise to a long discussion; and amendments (what we call *substitutes*) were offered with the purpose of delay. The chief opponent was Lord Hugh Cecil, fifth son of the Marquis of Salisbury, who allowed no *rights* in the Church either to men or women, inasmuch as the Church is a theocracy, but only *vocations;* and representative government was not a part of the woman's vocation. So in the New Testament, he said, women never took part in Church government, not even the Mother of our Lord, altho she lived for years in the Apostle John's house. Women, he argued, might administer, but not deliberate, and Paul excluded them from deliberative functions.

But Lord Hugh's argument did not carry conviction; it was too fine-spun. Sir Lewis Dibdin, Lord of Arches, said he had lately heard that distinction about women's incapacity used in the House of Lords, and at the end of the debate one of the older lords demonstrated his masculine capacity for legislation by inadvertently voting in the wrong lobby. As to fitness of women to choose delegates, he believed that the women in a parish generally know better than the men who are the most competent men for office. As to the biblical argument against women, the Bishop of Salisbury reminded Sir Hugh Cecil that the social condition of women has very much changed since Paul's time. Then no widow and no single woman had control of her property. Paul was speaking only of married women of his time. Besides, women did hold office in the Apostolic Church, at least as deaconesses. Some had the prophetic gift and must have used it. The Dean of Ripan went further. He said that Paul recognized women as speaking and praying in church, but required them to do it with their heads modestly covered. As to their using the franchise then, he said that we are told in the first chapter of Acts of the meeting, when 120 believers were with the Disciples, and some of

them evidently women, and they all proceeded to the most solemn act of the election of an Apostle to take the place of Judas.

The argument evidently favored the women, and the Council proceeded to vote. A majority of each of the Houses, bishops, clergy and laymen, favored the extending of the franchise to certain classes of women, to be decided later. The total vote was 153 to 58.

In the American Churches women generally have the right of suffrage, but not everywhere is the right of public speech allowed. Indeed, Paul's words are misapplied in many sections so as to forbid women to take any public part in service, except in singing; and the reason for this inconsistency is not clear. An extreme example of stupid ignorance lately attracted attention, where a rector forbade women to come to his church without hats, on the ground that Paul said they must have their heads covered. What Paul wanted covered was their faces; what the rector wanted covered was their top hair.

Insanity and Crime

How difficult is the problem that President Roosevelt had to deal with when he was asked to save from the gallows a criminal convicted of rape, on the ground that the condemned wretch was insane, is shown by the conflicting editorial comments upon the President's decision. Some of the Roosevelt organs condemn, while anti-Roosevelt journals, like the New York *Evening Post*, commend.

The crime for which the negro was convicted has become of such frequent occurrence in the United States—in the North as in the South—and vengeance in the form of lynching has become so serious a menace to the social order, that all right thinking men must agree with the President when he affirms the importance of swiftly inflicting legal punishment upon the ravisher. There is every reason to believe that certainty of legal retribution would be far more effective as a deterrent influence than any number of lynchings in which a whole community surrenders itself to savage passion.

But nothing is more dangerous than the device of meeting a special emergency by laying down a general working rule that must be applied under differing conditions, and President Roosevelt, in basing his action in this case upon a rule which he lays down in general terms to govern decision when insanity is alleged as a defense at criminal law, may have overstepped the bounds of wisdom. To say, as the President says, that a man should not be saved from the gallows "when unless that crime had been committed it would have been impossible to persuade any responsible authority to commit him to an asylum as insane," is to lay down a doctrine of medical jurisprudence that requires investigation.

The history of insanity as a defense in criminal law from the days of Sir Matthew Hale until now is an interesting chapter in mental and moral evolution. The great English jurist declared that a man should be held responsible unless his reason was so far destroyed that he had no more sense than a wild beast. Later on, the courts held that ability to distinguish between right and wrong should be accepted as the true test. Yet later, replying to a series of questions propounded by the House of Lords in the famous McNaughton case, the judges laid down the doctrine that an offender must suffer punishment for an act committed under a delusion if the act would have been criminal had the man been sane. For example, if a man kills another under the delusion that his own life is in peril and that he is acting in self-defense, he may be acquitted; but if he kills his victim as an act of revenge while laboring under the delusion that his character has been defamed, he must be hanged! This monstrous proposition, which is still maintained by the criminal courts of England and of many American commonwealths, is justly characterized by Maudsley as the doctrine that a man of unsound mind may be held to reason unerringly about the technical distinctions of criminal law.

President Roosevelt's doctrine is even less advanced than the dicta of the English judges. It even approaches a return to the wild-beast rule of Sir Matthew Hale. There are many

men and women at large, who are liable at any moment to commit acts of fiendish cruelty, whose insanity has not as yet happened to become so manifest that the civil authorities would feel justified in committing them to asylums. The commission of some diabolical act may be the first evidence of the final loss of all self control. To say that these men and women should be hanged is to take a view of a difficult problem in mental pathology which dangerously ignores all scientific distinctions.

Vegetarianism

Now, while the meat strike is on, when beefsteak is daily rising in price and the ham in the sandwich getting more and more diaphanous, the unwilling attention of the public is being forced to turn in the direction of vegetarianism, and its advocates are improving the opportunity to spread their ideas and practices. Popular hatred of the Meat Trust and popular sympathy with the cause, if not with the methods, of the workmen in the packing houses are inducing many to swear allegiance to the vegetable kingdom. It is not often one has such a chance to aim a blow at capitalism and at the same time benefit himself. When sociological influence and financial advantage back up the dietetic arguments of the vegetarians their cause is bound to make progress.

A great many people who believe in a mixed diet will still rejoice at this progress of the vegetarian movement, because vegetarianism is much more sensible than the advocates would lead us to believe. In this, as in other intended reforms, we must not consider the cause is as weak as some of the statements made in its support. In practice it appears to better advantage than in theory. Its *menus* are better than its briefs, and we can often swallow its dishes easier than its arguments.

There are two classes of arguments against meat eating, the hygienic and the humanitarian; the one that meat is unwholesome, the other that killing is wicked. Only strict vegetarians are entitled to use both kinds of arguments. The moderate vegetarians who use animal food not involving the sacrifice of mature life, such as eggs, milk, butter and cheese, should logically, tho they usually do not, give up to great extent the hygienic arguments; for in composition and nutritive value these foods are not materially different from flesh, and milk is much more likely to convey tuberculosis germs than pork is to carry trichina. With the addition of eggs and milk products, however, there is no difficulty in securing a perfectly balanced diet, beyond criticism from a dietetic standpoint, so it must be admitted that flesh is unnecessary.

The strict vegetarians, on the other hand, have a hard task to prepare from purely vegetable materials a ration in which the three food elements, protein, fats and carbohydrates, are in their proper proportion. The proportion of carbohydrates, the starches and sugars, is apt to be too great, and the protein, or nitrogenous matter, too little. It requires a great deal of ingenuity in the use of such protein-rich vegetables as beans, peas and nuts to prevent overfeeding with the fat and heat producing carbohydrates, and starving for the flesh-forming protein. Besides the numerous compounds roughly grouped by chemists under the name protein are not alike in nutritive value, and it is not at all certain that the protein of beans, for example, is as digestible as the protein of meat. Herbivorous animals have a much more complicated and efficient digestive apparatus than man. The energy required for digesting food must be subtracted to get its net value. But it must be admitted that our dietary standards are not altogether conclusive. They are for the most part merely calculated from the averages of well-fed persons and not worked out experimentally, as has been done for those of the lower animals. They are the customary, rather than the optimum. Professor Atwater will have to feed the man in his box for many years before science is able to dictate authoritatively our diet. In the meantime we must experiment for ourselves, and now is a good time to try the vegetarian methods. One does not have to subscribe to the vegetarian creed to take his meals at a vegetarian restaurant.

If it were they would have fewer patrons, for the fallacies and exaggerations of the vegetarian propaganda are somewhat discouraging. There is the con-

stant assumption that the vegetable kingdom is the most beneficent of the three realms of nature, just as medicine men recommend their remedies as harmless, because purely vegetable, regardless of the fact that our most violent poisons, such as opium, strychnine and prussic acid, are "purely vegetable."

Nor can a vegetable diet be recommended on the ground that its proportions are arranged by Nature. The man who cracks up the raw wheat on which he lives is not eating a natural food. Our modern grains are as artificial in structure and composition, as much the product of the ingenuity of man, as bicycles and dynamos. Within very wide limits it has been found possible to vary at will the ratio of protein and carbohydrates in wheat and corn.

Vegetarians devote much time to depicting the disagreeable processes involved in the preparation of meat foods, even going so far as to say in print that none of us would eat meat if we had to procure it, a queer statement when you think how many of us have at one time or another killed and dressed our own meat and fish. Nor have we observed the moral degradation which, according to the vegetarians, is inevitably connected with such acts. Our friend the butcher of our village is as mild a mannered man as if he had never cut a throat, and we know some very kindhearted and estimable ladies who wring the necks of chickens whenever we call. If, however, the *argumentum ad nauseam* is to be used, we would call attention to the fact that the food habits of the maligned pig are not more loathsome than the food habits of forced vegetables.

The humanitarian argument is all on the side of the meat eaters. It is they who are the true friends of domestic animals, which they feed, protect and care for at great trouble and expense, satisfying their wants much more completely than in a state of pure nature and terminating their happy tho abbreviated lives by an undreaded and painless death. If there were no meat eaters there would be no cattle and sheep except a few in zoological gardens. We cannot contemplate without a shudder what the vegetarians propose, namely, the extinction in this country alone of over 70,000,000 cattle, about the same number of sheep and 250,000,000 chickens and all their posterity throughout the ages to come. Such destruction of actual and potential life is worse than the dying out of the buffalo. We will eat meat every day rather than by our sin of omission to become an accomplice to the extinction of the several species of domestic animals now leading peaceful and contented lives on our farms and ranges.

Since, however, we have no fear that the vegetarian cause will be completely triumphant in the near future we heartily commend it. We advise the reader to hunt up a vegetarian restaurant and order the most fantastically named dishes on the bill of fare. Nowhere are we so conservative as in our food habits and nowhere is conservatism so injurious. To learn that it is possible to get a palatable and satisfying meal without a meat dish is a great step. The introduction of new kinds of food and better methods of preparation is a reform in itself. In the vegetarian restaurants as a rule more attention is paid to cooking, cleanliness and the appetizing presentation of food than in ordinary restaurants. In England on this account the vegetarian restaurants have become very popular even among those who are uninfluenced by the argumentation. The appeal to the stomach and purse has succeeded where the appeal to the conscience was ineffective.

Applied science is just beginning its work on the cultivation of new grains and fruits and invention of improved machinery for the cooking of food, and the possibilities in this field seem endless. Already in this substitution of the cereal for the beefsteak breakfast a veritable revolution in the food habits of the nation has been effected. Our chief dietetic vice is over-eating, and one is less liable to succumb to that temptation on a vegetarian diet. According to the experiments of Professor Chittenden our greatest national reform is to eat less and chew more, and this we can best do by dropping meat for one or two meals a day.

The Sense of Humor

In the beginning of life our sense of humor is always idiotic. A very young infant will cross its eyes and laugh immoderately at a fly on the end of its nose. But, while it is the sense soonest in evi-

dence, with most people it remains through life the least discriminating and the least intelligent faculty they have. The person who laughs at the contortions of a tortured animal or is amused at the impudence of vice shows as much lunacy in his idea of wit as the youngest child. A delicate question to decide, indeed, is where the intelligent laugh in us ends and the savage yell begins. Certainly, not every man who smiles has a right sense of humor.

The development of it depends more than any other faculty we have upon sex, temperament and profession, and it registers more shrewdly than any other the quality and capacity of intelligence. With reference to sex, the sense of humor is as often deficient in women as it is gross and undisciplined in men. This is accounted for in part by the fact that woman's outlook upon life is usually more restricted by conditions and conventions, but the real explanation is further to seek. Women have more sentiment, but less imagination, than men. Now, humor depends upon the ability of the mind to imagine certain incongruous relations from a given word, sight or suggestion. But women are mostly literalists. Their comprehension halts at the bare fact. The process by which a smiling analogy may be added belongs to the higher mathematics of humor, which they are less likely to attempt. This is illustrated by the sort of interest women take in comic newspapers. They are earnestly engaged in discovering "the point" of the joke; and, having discovered it, they pass to the next with an air of intellectual victory, rather than with the wit of a smile.

But they have made a six thousand years' study of the masculine character; its absurdities and limitations are an open book to them, and in this region they have a sense of humor so astute as to be almost instructive. Self protection, natural reticence, and a gentle feminine tenderness toward men keep them silent where they might shine with the very genius of witty comprehension; but if any man doubts the fact he has only to listen to a conversation between the dullest women of his acquaintance where the topic is "husbands."

The broader sense of humor in men is explained by the fact that they have a sense of liberty in mind as well as in action, which women never have; and they view life from more different angles. The politician, lawyer, merchant, minister and many others have pooled their wits so as to increase their common stock of humor. But the lack of sympathy between the two sexes at this point results in feminine seriousness and masculine coarseness. A man's sense of humor is his own. He does not share it with his wife, and it is not, therefore, disciplined by her greater delicacy of mind, because he doubts her appreciation and comprehension of the joke. This reserve on his part is often occasioned by supersensitiveness on her part. Women are so self-conscious, so defenseless, that they are suspicious of masculine wit. They insist upon a solemn and sacred relation to their mankind which must not be rendered ridiculous by the secularity of what seems to them vulgar wit. This accounts for the blackguard features of masculine humor; it is leered out privately beyond the reach of feminine censorship. But all men, even the most primitive, have it highly developed in one form or another.

After sex and profession, temperament and character have much to do with the development of the sense of humor. Some people bred to luxury and refinement are amused preferably by what is grotesque, indecent and vulgar. Occupying, it may be, the highest position in the social scale of things they indulge a ribald wit that is none the less vicious because it is expressed in chaste language. The explanation is that self-indulgence tends to grossness and sensuality, both of which are quickly revealed by the sense of humor, even when they would be otherwise concealed. For few men realize that their laugh is a personal proclamation of taste.

This perversion of wit may be found in any person whose mind is not morally normal. When a man becomes a cynic or a criminal, it is a sign that he has lost his cue; he has strayed from the right order of things; his point of view is taken from the wrong angle and the disease of his mind is evidenced very soon by the things which appeal to his distorted sense of humor. The cynic laughs at hope, finds goodness ridiculous and God an absurdity because his perspective is

wrong, and to his vision even loveliness assumes hideous shapes. His wit has become a carping insanity. According to the same logic, the criminal may laugh at tragedy, but he is usually rendered morose by what is innocently gay or humorous. Self-horror has fixed him in a world of horrors, so that his senses are all keen to comprehend best what is terrible or distressing. His frightful merriment is a symptom of his moral apostasy. In all such people the sense of humor has lost its natural quality and has become an irrational levity. The point is that it is usually the first sense to betray the abnormal condition. Had Conan Doyle recognized the fact that crime renders a man's humor insane, so that a close observer may detect a murderer by the things which do or do not appeal to his wit, he might have made Sherlock Holmes a greater marvel than he was.

Perhaps the sense of humor is most happily developed in those elect ones who combine culture and intelligence with sympathy and sensibility. With them it is a bright effulgence of the mind, so radiating that it may wink light into the dullest man's darkness. It is an arrow of wit flashing from one answering eye to another in a crowd. For the average crowd combines enough of the genius, brilliance and sensibility of mankind to be delightfully appreciative of what is truly humorous. And whatever else may be said of it, humor in its last analysis is the most healthy, sympathetic and effective of all human telepathies. It is kin to pity, and founded upon wisdom and sanity.

The Russian Disasters

The birth of a male heir to the throne of Russia is no fair balance for the terrible Russian misfortunes in the East during the past week. First came the investment of Port Arthur so closely by the Japanese that the Russian fleet was compelled to attempt an escape with the hope of joining the Vladivostok squadron. It was an utter failure; the Russian fleet was scattered, and nearly the whole of it was practically annihilated, a part driven back with serious damage to Port Arthur, where they are the mark of Japanese guns, and part shut up in neutral ports, whither they had fled and where they are disarmed. Only one is abroad on the open sea trying to find its way to Vladivostok. And now comes the crowning disaster. The three magnificent Russian cruisers scouting near Vladivostok have been caught by an apparently inferior Japanese force of cruisers, and one of them is sunk, and the two others have returned damaged to their harbor. There is absolutely no single success thus far for Russian arms by land or sea; only blank failure. Do the Russians lack courage? Do they lack intelligence and skill? Do they lack honest equipment? There must be some reason, for accident is by this time excluded. There is some space for chance in war, but, on the whole, success is surely organized, planned; and it is plain that Russia does not know how to make war as does Japan.

Turkey Yields

It is with a feeling of relief that we learn that the Porte has yielded to diplomatic pressure from the United States and has granted to American citizens in Turkey the same privileges that had been granted freely to French, Russian, German and British schools and institutions in the Turkish Empire. The Porte had delayed and refused, and it was not consistent with the decencies that we should not have the privileges of other favored nations. When the President at last said that patience had ceased to be a virtue, and sent war vessels to Smyrna, as he had done previously to Beirût, it was no easy question to answer what we should do next if Turkey still refused to grant our demand. We might withdraw our Minister from Constantinople as an expression of dissatisfaction, but what next? Would we capture a port? Would we make war? Fortunately the Porte was not so unreasonable and it took the hint at Smyrna. And yet it is not strange that Turkey does not like our schools. They really make her more anxiety than the multitude of Russian schools in Palestine, and the French and German schools in Syria. Our American schools are reaching the people and giving them intelligence, and that is precisely what the Turkish Government does not want. The American schools are loyal; they meddle with no politics, but the people that are educated and intelligent will meddle with

politics, and some of them will engage in seditious undertakings. Education is a serious thing in such a Government, as it is equally in Russia. Russia wants no American missionaries, and Turkey would be glad to get rid of them. But be it remembered that it is one ruling class that objects to American schools, while a great multitude of people welcome them gladly. And let it be also remembered that by treaty rights American citizens are at liberty to live, teach and preach in Turkey. The Moslem may and does murder the Armenian, and the Armenian resists and plots, but the Turk has no right to shut out American citizens or to forbid them to engage in the business of teaching.

Physical Deterioration in England

The sensation caused a few months ago by the reports of recruiting officers of the British army, that the large proportion of applicants for admission to the army who were rejected on account of physical disability indicated a general degeneracy in the national physique, resulted in the appointment of a Royal Commission to investigate the subject and recommend remedies. The report of the Commission resembles the chapter on the snakes in Ireland, not on account of its shortness, for it covers 112 pages folio, but because the conclusion is that there has been no physical deterioration, or at least that the data on the subject is so incomplete as to be inconclusive. Consequently the Commission urges the organization of a permanent Anthropometric Survey to take measurements of children and young persons in schools and factories to see if their growth and health are what they should be. Where any failure to reach the required standard is detected, either in individuals or classes, an investigation can be made to determine whether it is the fault of the parents or of the conditions of life and employment. The abuse of alcoholic stimulants was found to be "a most potent and deadly agent of physical degeneration," and the drinking habits growing among women of the working classes are stated to produce the most serious and permanent injury to offspring. Many social reformers seem to think that higher wages will cure all evils, but the Commission notes the peculiar fact that "lunacy increases with the rise of wages and the greater spending power of the operative class; while a falling wage-rate is associated with a decrease in drunkenness, crime and lunacy." According to this the destruction of the poor is their riches. But, nevertheless, the Commission does not include among its fifty-three suggestions for the improvement of the condition of the poor a recommendation that their wages be cut down to preserve their mental and moral sanity.

The horrors of war are past description. The one Russian painter who could best picture the awful slaughter was himself sunk with the Admiral and seven hundred men in the first disaster of the "Petropavloff." What a painting Verestchagin might have made, had he lived, of the disaster of the "Tsarevitch" last week, when several Japanese cruisers surrounded it and poured shot and shells into the devoted vessel, and the chief Admiral of the fleet, Witthoft, was blown to pieces in the conning tower, his body swept into the sea, and one of his legs left on deck, and two other high officers perished with a multitude of men. Nothing is more horrible than war, except injustice and oppression.

When the Samoan Islands were divided between Germany and the United States, the two larger western islands, Savaii and Upolo, went to Germany, and the small Eastern islands, principally Tutuila, went to the United States. Our advantage was that we held in Tutuila a splendid harbor. The chiefs of the outlying little Manua Islands declined to accept American rule, until at last they have found that it would be to their advantage, and they have ceded authority to the United States. It is agreeable to know that our style of rule is approved and freely accepted.

It seems past belief that 100,000 fraudulent naturalization papers should have been sold here in New York within a very few years—mainly to Italians. That number is enough to vitiate an election. It is no credit to officers of law if such an imposture can have been operated.

Insurance

Causes of Death

A MORTALITY table for 1903 has been prepared by the Ætna Life. It shows 1,386 as the total number of deaths of record. The causes are various and make an interesting exhibit. The largest number, as will be seen, took place because of organic heart disease. There were 17 suicides, and 45 persons died from old age. The causes of death are tabulated in detail as follows:

Cause of death.	Total deaths.
Typhoid fever	55
Tuberculosis	101
Cancer	87
Rheumatism	2
Diabetes	18
Apoplexy	127
Paralysis	38
Other diseases of nervous system	54
Organic heart disease	194
Other diseases of circulation	57
Pneumonia	95
Grippe	24
Other respiratory diseases	45
Appendicitis	22
Cirrhosis of liver	16
Other digestive diseases	69
Bright's disease	108
Disease of prostate	27
Other genito-urinary diseases	39
Senility	45
Accidental	77
Suicide	17
All other diseases	69
Total	1,386

Perils of the Vacation Season

AMID the varied pleasures of the vacation season many of us are apt to forget the perils that constantly hover over us. The journey by train or boat, to new and unaccustomed places, to seashore, or mountain, on river, sea or lake, always contemplates the possibility of accident. All sports and recreations have possible danger in them. Excursion and other trains, motor cars, trolleys and steamboats do not always make safe journeys. Canoes are exceedingly liable to upset, and that little sailboat in which it is so delightful to sail with the merry company might easily give you a dip in the water in which it is not impossible to drown. Even a bicycle may throw its rider. In case of accident it is very comfortable to feel that even during convalescence you are not without earning power, so long as a first-class accident company has you covered by one of its policies. The perils of the vacation season, if not nullified by accident insurance, are at least mollified when they occur.

New York Life Receives German Concession

GERMAN dispatches, confirmed here, announce that the New York Life Insurance Company has been granted the concession to do business in Germany for which application had previously been made. This is the outcome of protracted negotiations which have now been concluded between this well-known American life insurance company and the German Government, the result of which has frequently been in grave doubt. Statements heretofore current that the business of the New York Life Insurance Company was not remunerative either in Germany or in Austria would not seem to be borne out at least in so far as Germany is concerned, otherwise there could have been no wish on the part of the company to do business under concession in Germany. According to President McCall's advices from Berlin the Imperial Government has been made entirely satisfied with its investigation of the New York Life's affairs both here and at Paris, which latter city is the company's headquarters in Europe.

A NEW fire hazard has lately been added to those with which we have long been familiar in the recent explosion of two patent fire extinguishers of the tank pattern. One of these explosions took place in Brooklyn, N. Y., and the other in Jersey City, N. J. It would seem that firemen already have enough dangers in fire fighting without having to face the risk of being blown up by fire extinguishers upon which they have relied for safety.

Financial

Condition of the Crops

THE Government's latest monthly crop report, as interpreted by the Statistician of the New York Produce Exchange, points to a yield of 2,564,000,000 bushels of corn (last year's harvest was 2,244,000,000), and 605,900,000 bushels of wheat. Of course, the growing corn is not yet out of danger, but there is promise of as large a crop as ever has been harvested. The harvesting of winter wheat has practically been completed; the decline from last year's 399,800,000 bushels to 333,400,000 this year is due to a reduction of the area by more than 5,000,000 acres. Based upon conditions prevailing on August 1st, this report does not take into account the injury caused by rain and rust in the spring wheat district since that date. It is this injury that has caused the recent advance of prices. How far the total will fall below 605,900,000 bushels it is impossible to ascertain. Probably the crop will not be less than 570,000,000; last year's was 637,800,000. At all events, the price of wheat will continue to be high, for the leading London authorities say that the crop of the entire world is less than last year's by a considerable quantity. Beerbohm's estimate points to a loss of 162,000,000 bushels; Dornbusch makes the shortage 92,000,000. Others make it less, but all agree that this year the world is not producing so much wheat as was harvested in 1903, and their estimates of our crop are too large. The Government's report indicates a good crop of hay, and shows a very high average condition for potatoes, 94¼, against an annual average of 84½ for the last ten years. As was shown by another report, two weeks ago, the cotton crop promises to be the largest ever known.

A DINING car is to be used on the Chicago, Aurora & Elgin trolley road.

....The output of pig iron in July was 1,082,794 tons, with which may be compared June's 1,292,030 and April's 1,557,267.

....An American company, controlled by Philadelphia capitalists, is about to construct and operate an extensive electric traction system in and around Monterey, Mexico.

....Governor Odell, of New York, has brought suit to recover $126,890, which he lost by investing in the bonds and stock of the United States Shipbuilding Company.

....The American Tin Plate Company, a part of the Steel Corporation, has reduced the price of its tin plate by $3 per ton to meet the lower prices of "the independent manufacturers."

....Charles M. Schwab, formerly President of the United States Steel Corporation, has made good the losses of his friends and business associates in the United States Shipbuilding Company by paying to them about $2,000,000.

....In the last ten years, Newfoundland's annual purchases from Great Britain have fallen from $2,680,000 to $2,143,000, her purchases from Canada have remained almost stationary ($2,886,000 in 1893, and $2,869,000 in 1903), and her imports from the United States have grown from $1,665,000 to $2,920,000, being now at the head of the list.

....According to a recent report of the Geological Survey, the output of coal in the United States in 1903 was 359,421,311 short tons, or an increase of 19 per cent. over the output in 1902, and nearly twice as much as was produced in 1893. The value ($506,190,733) showed an increase of 38 per cent. The increase in the average price of anthracite per ton was 11½ per cent.

....On account of her great draught it will be four years before the new White Star liner "Baltic" can enter or go out of the port of New York with a full cargo. When loaded to her full capacity she draws 36½ feet. With 6,000 tons less than a full cargo, she went out on her first trip drawing 32½. It will take four years to complete the new channel, which is to have a minimum depth of 40 feet.

....Dividends announced:

Buff. & Susq. R. R. Co., Preferred, 1 per cent., payable September 1st.

Vol. LVII NEW YORK, THURSDAY, AUGUST 25, 1904 No. 2908

Survey of the World

Ex-Senator Davis Notified

Formal notice of his nomination was given to ex-Senator Henry Gassaway Davis on the 17th inst. on the lawn in front of a hotel at White Sulphur Springs, W. Va. His response was brief. The notification address of Congressman John Sharp Williams proved to be a campaign speech that filled five columns in the daily papers. Mr. Williams undertook to point out "some of the blunders of our ancestors, as viewed from the standpoint of the wisdom of Republican statesmen who have embraced the strenuous life." The entire address was in a satirical vein, a review of our early relations with the Indians, of the causes of the Revolution, of taxation doctrines and of our attitude toward foreign nations in the first years of the Republic serving as a basis for ironical contrasts with the present policy of the Republican party, as that policy is defined by Democrats. Criticising ex-Secretary Root's remarks about Mr. Davis's age (in the address of notification to Senator Fairbanks), he said: "Mr. Root forgot that Democratic Presidents are never killed, and that they never die while holding office, altho some of them do afterward." At the beginning of his response Mr. Davis asked if it were not "significant of a truer and closer brotherhood among us that for the first time since the Civil War a nominee on the national ticket has been taken from that section of our common country that lies south of Mason and Dixon's line." He "heartily indorsed" the platform, and, "with the convention and its nominee for President," regarded "the present monetary standard of value as irrevocably established." Four years ago Republican speakers had pointed to the prosperous condition of the country and expressed fear "of the ill results, especially to the laboring men, which would follow any change in the political complexion of the Government:"

"It is true that the times then were good, but it is no less a fact that, while there has been no change in the party in power, many of the evils prophesied have come under Republican rule. Four years ago factories, mills, mines and furnaces were in active operation, unable to supply the demand, but now many are closed, and those that are open are being operated with reduced force on short hours. Then wages were high, labor was scarce, and there was work for all. Now work is scarce, many wage earners unemployed and wages reduced. The apprehension which now prevails in business circles and the present unsatisfactory industrial conditions of the country seem to demand a political change."

The most sacred right of property, he continued, was the right to possess and own one's self and the labor of one's own hands—capital itself being but stored-up labor:

"For years I worked in the ranks as a wage earner, and I know what it is to earn my living in the sweat of my brow. I have always believed, and my convictions came from the hard school of experience, that, measured by the character of work he does and the cost of living, a man is entitled to full compensation for his services. My experience as a wage earner and my association with labor have alike taught me the value of Democratic principles; for in them the humblest has the strongest security for individual right and the highest stimulus to that independence of spirit

and love of self-help which produce the finest private characters and form the base of the best possible Government"

In the recent excess of expenditures over receipts he saw evidence of extravagance and an argument in behalf of a change to the Democratic party. The percentage of increase in population, wealth, manufactures and railroad mileage had been greater from 1850 to 1860, under Democratic rule and the Walker tariff, than in any decade since. The cost of Government had increased from $2.01 per capita under Buchanan (and $5.10 under Cleveland) to $7.10 under Roosevelt. The Republicans were claiming "great consistency in their attitude on the currency question," but they had favored the double standard in their party platforms of 1884, 1888 and 1892. In conclusion, he warmly commended Judge Parker, congratulated the party upon the adoption of a "sane, safe and sound" platform, and begged his countrymen to "guard with great care the sacred right of local self-government, and to watch with jealous eye the tendency of the times to centralize power in the hands of the few." In a letter to a friend, published a few days later, he denied that he had ever been hostile to the laboring class. Being a large employer of labor, he had never had any serious trouble with his employees. He had never discharged a man for belonging to a union. It was not true, he said, that he had instituted proceedings which led to the granting of an injunction against strikers by Judge Jackson; and the injunction in question did not relate in any way to men in his employ.

Mr. Watson's Views

Accepting the nomination of the Populist party, Mr. Thomas E. Watson made a long address at Cooper Union, in New York, on the 18th. He attacked both the great parties, but was especially severe in his remarks about the Democratic ticket. Both the old parties, he said, were now financed by Wall Street, whose servile tools they were. The Republican party was the champion of corporate interests and special privilege. He believed that Mr. Roosevelt was "a brave, honest and conscientious man," but he opposed him because Mr. Roosevelt stood for governmental principles that were "hurrying the Republic into a sordid despotism of wealth." The situation of the Democratic party was ludicrous; the Republicans had a creed and were willing to fight for it, but he couldn't see why anybody should vote for the Democratic ticket. "To what point is it directing its line of march except to the Republican camp?" Judge Parker was surrounded by the Wall Street magnates who had financed his campaign, and when he cracked his Wall Street whip the Democratic legions furled their flags and reversed their line of march. Did the Democratic party think the people would trust it when it confessed that for eight years it had made a colossal blunder on the currency question, when it admitted that for eight years it had been wrong and the Republican party right? Judge Parker had capitulated to the Republicans on the tariff without firing a single gun. His acceptance speech had made his party's attitude toward Trusts precisely the same as that of the Republicans. He had pointed out nothing wrong in the Republican Philippine policy, nor had he shown wherein he would change it. He had prejudged the union laborers of Colorado, but had not censured the unscrupulous monopolists who had corrupted the Colorado Legislature to defeat the people's will. The Democratic campaign was merely an unscrupulous hunt for office. In conclusion Mr. Watson defended the Populist platform, dwelling upon its demand for the public ownership of railways and telegraphs, and for an income tax, and its opposition to national bank currency. He did not believe that "the present tyranny of the corporation, the monopoly, and the autocracy of wealth" could "endure forever."—In Missouri, Senator William J. Stone has attacked Mr. Folk in signed articles, asserting that altho the latter pretended to oppose the nomination of Cook and Allen, the machine men placed on the State ticket, he had sought an alliance with them before the convention. Mr. Folk replies, denying this, and saying that the Senator is "supporting the ticket with a knife," and seeking to divert the public mind from the dominant issue.—It appears to be admitted that ex-Secretary Root positively and finally declines

to be a candidate for the office of Governor of New York. It is said that if the nomination should be made, he would not accept it.

Negroes Burned at the Stake

The trial and the conviction of two negroes at Statesborough, Ga., last week, for the murder of the Hodges family—a farmer, his wife, and their three children—were quickly followed by the burning of the prisoners at the stake. Two weeks had elapsed since the murder when, on the 15th, William Cato, one of the negroes, was brought to trial. At the beginning of the proceedings the Rev. H. A. Hodges, a brother of the murdered farmer, prayed for an unbiased verdict and a careful observance of the laws by the people. On the same day Cato was found guilty, and on the following day Paul Reed was convicted. Both were sentenced to be hanged on September 9th. Reed had confessed, and his wife had given conclusive testimony against both of these men. They had told her the whole story, and she had washed their bloody clothes. To conceal the crime they had burned the farmer's house. One little girl, at first overlooked by them, had been discovered behind a trunk and had sought in vain to buy her life with five cents, all the money she had. The court and the two prisoners—with a dozen of their associates believed to have guilty knowledge of the crime—were guarded by two companies of militia, one from Statesborough and the other from Savannah. There had been no disorder, but it appears that the lynching had been planned before the trial. After sentence had been pronounced the prisoners were taken to an upper room. Seizing two of the military guards, the mob, which had quickly formed, took away their rifles and ascertained by examination that these arms were not loaded. It is asserted that by order of their commander, the captain from Savannah, the soldiers had been deprived of their cartridges and directed not to harm any one. All the other guards at the court house were at once seized and disarmed. Cato and Reed were then taken from the building to a place in the forest two miles away. This was in the middle of the day. They were chained to a tall stump, pine wood was heaped about them, and twenty gallons of kerosene were poured over their bodies. There, at 3 p. m., after an hour's delay, during which they were photographed, the two men were burned to death. No attempt to disguise themselves was made by the lynchers, among whom were prominent citizens. The pastor of the Baptist Church in Statesborough has called a meeting of the Church Committee, with the purpose of asking for the expulsion of some of the lynchers. Reed told a story about a secret society, the Before Day Club, organized for murder and robbery. Two negro preachers, he said, were members of it. These preachers have left Statesborough, but there is evidence that Reed's story was a lie. After the lynching the court released twelve negroes who had been arrested with Reed and Cato. White men followed one of these and killed him that night. The body of another has been found. Two inoffensive negroes, named Roberts, were shot whil asleep in their beds, but they will recover. Governor Terrell, who was in St. Louis, has ordered an investigation.—At Thomaston, Ala., on the 16th, Rufus Lessuer, a negro, held for attempted assault upon a white woman, was taken from the jail and lynched. On the 20th, at Cordova, Ala., a negro named Avery, who had killed the town marshal, was taken from jail and shot by a mob.

A New Outbreak in Colorado

Last Saturday afternoon 1,000 miners, non-union men, came to Cripple Creek from their work in the hills and set out to deport a considerable number of union men and other persons obnoxious to them, asserting that a conspiracy had been discovered. From the store formerly owned openly by the union (the Western Federation of Miners), and now conducted by a corporation chartered in Montana, they took the manager and his clerks. Others captured and borne away were Frank J. Hangs, the union's attorney; ex-Deputy District-Attorney Cole, Deputy County Clerk O'Neill, the president of the Carpenters' Union and ex-Attorney-General Engley. These prisoners, with a dozen more, were marched out of town. Some were sent under guard to Florissant, twenty miles away, and others to Cañon City. All citizens who had furnished bonds for per-

sons heretofore arrested were required to withdraw from these contracts. The jail was defended against the mob, but several of the sheriff's deputies were made prisoners. Later in the evening the union store was looted. The action taken by the non-union miners is said to have been planned by the Mine Owners' Association and the Citizens' Alliance. The union's store had been bought by representatives of the Federation in Butte, and the concern was recently incorporated in Montana. The Citizens' Alliance forbade miners to trade at the store, and the newspapers were not permitted to print its advertisements. Owing to the Montana charter, the union hopes to take its case into a Federal Court by applying to such a court for an injunction.

Other Labor Controversies

Further efforts made by Mayor Harrison, in Chicago, last week, to settle the controversy between the beef packers and their employees on strike were unsuccessful. It was decided by the Corporation Counsel that the packers were violating the building and health laws by lodging the new men in their packing houses. This encouraged the strikers, whose leader, President Donnelly, remarked that after the new men should have left work to seek lodgings outside of the packers' property they would not be able to get back again. On the night of the 20th there was a lively exchange of shots between a carload of new men, leaving the yards, and a party of strikers. It is said that the new men fired first, believing they had already been attacked. One striker was killed and several other persons were wounded. On the 19th a non-union man was found unconscious with his eyes gouged out. In New York the police have had all they could do to protect the packers' new employees.—Philip Weinseimer, leader of the striking employees of the builders in New York, and president of the plumbers' union, has been arrested and indicted for such extortion as was proved in the cases of Sam Parks and other leaders of last year's great strike. One Essig, a contractor at work on a large building, asserts that Weinseimer required him to pay $2,700 as the price for calling off a strike—$1,000 in cash and the remainder in six notes. When payment of the last note was made, a few days ago, marked bills were used, but when Weinseimer was searched these were not found. It is said that the District Attorney has several of the notes.—In Hartford, where the workmen in the building trades went on strike for a cause which we explained last week, and were then locked out, a walking delegate named George Butler is to be prosecuted for extorting $100 from a builder. The employers there have quarreled among themselves, and their association has sued two members for $5,000 each because they declined to join in the lockout.—The employees on the New York elevated roads threaten to go on strike unless their applications for places on the new subway have priority over all others and are accepted with allowance for seniority in their present employment. They assert that what they ask was promised last year; the company denies that such a promise was made, and it has already selected three-quarters of the number of men needed, from applicants not connected with the elevated service.—At the Rogers Locomotive Works wages will be reduced by 10 per cent. on September 1st.—Trains bearing non-union men to Joseph Leiter's mines at Zeigler, Ill., have been attacked by riflemen in ambush. Many shots were fired at a train on the 16th, and at another on the 18th. Five guards were wounded. Mr. Leiter has procured for use on such trains a steel car armed with a machine gun. He has 400 non-union men in the places of the strikers, and Zeigler resembles a fort. Four machine guns command all the entrances, and an elevated searchlight throws its rays upon the surrounding country for a distance of ten miles.

The Philippine Islands

An order from Governor Wright, issued on the 15th, requires the concentration of the inhabitants of the Banos, Catbalongan and Gandara River districts of the island of Samar. The local authorities are directed to quell disturbances there, repress roving bands of natives and provide shelter and food for the reconcentrados. Advices by mail say that the inhabitants of twelve districts in the province of Cavité (Luzon) were concentrated

several weeks ago.—A long petition addressed to the President through the agency of Secretary Taft has been signed by all the members of the Honorary Commission of Filipinos, who recently arrived in this country, five excepted, the name of Philippine Commissioner Pardo de Tavera being at the head of the list. This petition asks that the proposed Legislative Assembly be convened "as soon as possible and before the period fixed by the Philippine act." The speedy convening of the Assembly, says the petition, "has become indispensable," in order that proposed laws shall be fully discussed:

"The internal revenue law, under which grievous burdens are placed upon the affected corporations and industries, was recently enacted by the Philippine Civil Commission against the unanimous protest of all classes of society, it being the widespread opinion that the high rates of taxation proposed would only make more difficult the development of economic interests now in a critical condition, and would bring no perceptible and positive advantage to the country in general. Nevertheless, in spite of this general and unequivocal disapproval on the part of the people, the law was recently enacted without essential modifications, leading to a renewed protest of public opinion, as shown by telegrams that we have received from Manila."

It is also urged by the petitioners that the tariff duties on Philippine sugar and tobacco imported into the States be either removed or greatly reduced, because both of these products have lost the markets they had under Spanish rule, and this loss can be made good only by facilitating the exportation of these staples to the States.

On the Isthmus and South of It

One cause of the Panama Government's protest against our Government's interpretation of the Canal Treaty has been the entry and departure of merchant vessels from the new Zone port of Ancon, instead of the old and adjoining port of Panama, which thus loses port fees. A British steamship from Valparaiso recently entered at Ancon against the protests of the Panama Government, and her captain defied a squad of soldiers sent to arrest him.—Shippers on the Pacific Coast complain of the existing contract between the Panama Railroad Company (now controlled and owned by our Government) and the Pacific Mail Steamship Company, a contract that gives a transportation monopoly to the steamship company with respect to all goods carried across the isthmus on the railroad and destined for our Pacific ports. It was designed to control the competition of the isthmus route with our transcontinental railways. Altho the Government now owns sixty-nine seventieths of the railroad stock, it appears that it cannot terminate the contract before September 1st, 1905, because it cannot elect its new board of directors until April 1st, and six months' notice will then be required.—Minister Bowen has been instructed to demand that the Venezuelan Attorney-General be directed to ask for the suspension of the Receiver appointed in the case of the New York and Bermudez Asphalt Company, and a restoration of the seized property, pending an orderly consideration of the issue involved. The court will not convene until September 15th. It is reported that a German squadron will arrive at La Guayra before the end of this month. Two British war ships have arrived at Trinidad and are awaiting orders prior to their departure for Venezuelan waters.—In Paraguay the revolutionists appear to control the situation. The Minister of War has fallen into their hands. At last accounts, Asuncion was at their mercy, had been bombarded once, and was soon to suffer from a second and more determined attack.

The Protestants on the Separation of Church and State in France

The Protestant Church of France is intensely concerned about the seemingly unavoidable separation of State and Church, which is indeed not the official program of any political or ecclesiastical party, but has by the force of circumstances been made almost inevitable. Some of the Protestant leaders look upon the matter with a feeling akin to fear and trembling. Especially are the representatives of the leading charitable associations worried about their deficits. The Paris Mission Society is short 200,000

francs; the Evangelists of French Colonies, 11,542 francs; the *Société Central*, of 47,000 francs; the *Société biblique de France*, of 41,000 francs. How is this to be made good if the State withdraws its annual budget of one and a half million? Then, too, how are many of the pastors to get their salaries? Others, again, are ready to welcome the separation. One movement of this kind is headed by Pasteur Frank Piroux, who regards this change demanded by the principles of the Reformation, and is even enthusiastic in advocating it. Others are making provisions to meet the crisis. A *Commission préparatoire de féderation* has been organized and has already prepared a program for a union of the different churches when the separation has taken place. This program is published in the *Christianisme au XX Siècle*, and contains six articles, which show that it is to be a federation with the recognition of the doctrinal *status quo* of the different Churches, something akin to the "Ausschuss" of the Protestant Churches of Germany organized some months ago. The initiative in this agitation was taken by the Synod of Clairac, and aims first at a union of the *Eglises libres*. More conservative circles hesitate. The Pasteur Saillens, of the Baptist Church, declares in the *Echo de la vérité*, that he and his friends will refuse to enter into an organization which does not even recognize the dogmatical principles of the Evangelical Alliance, especially on the divinity of Christ and the absolute authority of the Scriptures. The *Vie nouvelle* declares that the salary question will be a momentous matter, when the separation comes, as the congregations will not make up what the State has withheld. The proposal accordingly to tax the members finds advocates, and it is computed that fully two million francs would have to be raised in this way annually. On the other hand, the "*Commission Permanente*" appeals to the faithful in a special circular letter, to prepare for the inevitable separation by a renewal of faith and Christian life, and asks the *Commission Fraternelle* to influence the Government to insure the principles of the Protestant Church when the change comes.

The Siege of Port Arthur

The details of the operations about Port Arthur are very uncertain, for there are no reports from neutral war correspondents and no information is given out from the Japanese headquarters. Extracts from General Stoessel's reports, judiciously selected and censored, are given out at St. Petersburg a week or two late, and contain only accounts of Japanese repulses with terrible loss, and assurances of the health and happiness of the garrison. Ships at sea beyond the zone of the mines report an almost continuous and heavy bombardment of the forts and town by the Japanese, with little reply from the Russian guns. The only other source of news is the Chinese junks, which run the blockade and cross to Che-Foo. The refugees and traders from these have, of course, little knowledge of the military movements, and their rumors are more exciting than convincing. The general movements of the Japanese and the positions held by them are, however, pretty well established, and it can be seen from the accompanying map that the Japanese have now completed the investment of the fortress from sea to sea, their lines extending from Takhe Bay on the east to the Liau-tie-shan promontory south of Pigeon Bay on the west at a distance of one or two miles from the Russian fortifications. None of the chain of the main defenses encircling the port has been captured at the time this issue goes to press. The main movement of the Japanese has been effected by the right wing, which began its operations by an attack on the Wolf Hills July 25th. This position had to be taken because, as can be seen from the figures given on the map, it is the highest point north of the city, and is in the middle of the peninsula dominating the railroad. This was evacuated by the Russians on July 30th. The Japanese then occupied the hills near Suei-sze-ying, on which they erected two forts to protect the further advance of the right wing. Pali-chwang was also fortified, but, according to later reports, the Japanese were obliged to abandon this point on account of the enfilading fire

from the Keekwan and Antszshan forts on each side. The next point occupied was Taliu-kiatun, and the hight of Taku-shan southeast of this, unmarked on the map. Louisa Bay was then taken, and during this past week the Japanese army, with the aid of the fleet, has captured all the forts around Pigeon Bay, and has passed south along the coast nearly or quite to Liau-tie-shan. On the night of the 15th the Japanese sent to Lieutenant-General Stoessel an offer to remove the non-combatants from the beleaguered city, and allow the garrison to march out with all the honors of war and join General Kuropatkin, on condition that Port Arthur and all the ships in the harbor be immediately surrendered. General Stoessel is reported to have received the proposal to surrender with a furious outburst of anger. The city can now be reached from almost every direction by

Map of Port Arthur and Vicinity, Showing the Progress of the Siege

the shells of the Japanese. Fires are frequent, and many buildings have been destroyed. The people are living in bomb-proofs. As soon as the fortifications and garrison are considered sufficiently weakened by the bombardment a general assault will probably be ordered, for which, it is estimated, 60,000 Japanese troops are available. Thirty regiments have been sent from General Oku's army to reinforce the besiegers.

The Scattered Fleet

The Russian cruiser "Novik," which escaped during the engagement of August 10th and was trying to enter Vladivostok by passing around the Japanese islands to the eastward, was pursued by the Japanese protected cruisers "Chitose" and "Tsushima" and sunk near Kovsakovsk on Saghalien Island on the morning of August 20th. The "Novik" was badly injured and ran ashore. There was no loss of life on the Japanese vessels, but the "Tsushima" was hit once in the coal bunkers.—The Russian cruiser "Diana" took refuge in the harbor of Saigon, French Indo-China. The French Foreign Office announces that the laws of neutrality will be strictly observed.—The Japanese Government refuses to admit any error in capturing the "Ryeshitelni" in the neutral port of Che-Foo. The Japanese claim that by using the port as a means of escape from the enemy the Russian war ship was guilty of a breach of the neutrality of China and this justified the entrance of the Japanese ships to remove the "Ryeshitelni" and restore the violated neutrality of the port. It is reported that China has agreed to the Russian demands, and will grant compensation for the loss of the "Ryeshitelni" and degrade the Chinese admiral and the Taotai, or governor, for failing to protect it.—The Russian cruiser "Askold" and torpedo boat destroyer "Grozovoi" have remained in the harbor of Shanghai making repairs, notwithstanding the demand of the Taotai that they either leave the port or disarm. The Taotai notified the American Consul-General, Mr. Goodnow, as dean of the consular body, that China cannot protect the foreign settlements nor compel the Russian vessels to obey the rules of neutrality. The "Askold" is docked near the warehouses of the Standard Oil Company, which are valued at over $1,000,000. On Sunday afternoon, August 21st, a Japanese destroyer cleared for action, passed Woo-Sung at full speed and started up river toward Shanghai. The American destroyer "Chauncey" at once followed and took a position between the Japanese ship and "Askold," thus protecting the Russian vessel and the dock. It is stated by Rear-Admiral Sterling, in command of the American squadron at Shanghai, that the "Chauncey" went up the river to carry dispatches, and that her movements had no connection with the arrival of the Japanese destroyer.—The "Rossia" and "Gromoboi," which are all that are left of the Vladivostok squadron, were very badly injured in the fight with Admiral Kamimura in the Korean Strait. The former was hit in the hull eleven times and the latter had six holes on the water line. Half of the officers and 40 per cent. of the men were killed or wounded in the fight.—Prince Ouktomsky's five battle ships and the cruiser "Pallada" are at Port Arthur.

The Herrero War

General von Trotha has finally succeeded, after many months of delay in the arrival of reinforcements and supplies, in gathering his forces for an energetic attack on the Herreros in the Waterberg Mountains in German Southwest Africa, and has inflicted a signal defeat on the natives. The position they occupied was a strong one, a plain of about 250,000 acres in the heart of the mountains, only approachable by difficult passes. Here were gathered 6,000 fighting men with their women and children, and some 50,000 head of cattle and 150,000 sheep and goats. The Germans numbered about 2,000 men. The attack was made in the night, and fighting continued all the next day. Five German officers and 19 men were killed and six officers and 52 men wounded. The old chief, Samuel Maherero, is reported to be very despondent, and to spend most of his time in having the Bible read to him.

Facts and Phases of the Cuban Question

BY BISHOP WARREN A. CANDLER, D.D.

FOR the seventh time I have visited Cuba.

The changes—most of them for the better—since my visit in the autumn of 1898, are marvelous.

The streets of Havana are clean, and the sanitary conditions of the city are as good as in any city of the same size of which I have any knowledge. In 1898 the city was one of the foulest in the world, and yellow fever victims died on the streets.

The order is good, and life and property are as secure here as anywhere.

The administration of President Tomas Estrada Palma is commended on all sides. In May the new Government was two years old. It has disappointed all the fears and exceeded all the hopes which were felt on account of it at the outset of its existence.

The impression gathered from talking with men of all classes here, including both Cubans and Americans, is that President Palma is not a brilliant man, as the word goes, but a wise, prudent and honest man. The people have confidence in his moral qualities.

Some of the Cubans think he is a little "too Americanized." His long residence in the United States has taught him lessons in government which they perhaps have not yet so clearly discerned.

But when due allowance is made for this and kindred prejudices which some entertain against him, it remains true that his people have faith in his honesty not unlike the confidence the people of the United States have for the sincerity and downright straightforwardness of Mr. Cleveland. The Cuban people believe that "Don Tomas" will not lie nor steal nor permit political corruption to flourish around him.

He has used the veto power with wisdom and firmness.

In one instance he vetoed what was known as the "Corona law," a statute exempting members of Congress from the ordinary processes of trial by the courts, and making them amenable to the Supreme Court only. It grew out of a homicide by Congressman Corona, of Santiago. The President vetoed the bill as a piece of class legislation, entirely incompatible with the genius of a republican form of government. Congressman Corona has begun a four years' term in the penintentiary for his crime. Would the administration of justice in the case of an American Congressman, charged with a homicide, have been more swift and unfaltering in our own country?

Again, President Palma vetoed the Lottery bill. This was an act of even greater courage. The Spanish traditions concerning lotteries, the habits and spirit of most Cuban men as to gambling by lottery and otherwise, were combined against him; yet he withstood them all and forbade by veto the creation of a lottery under Cuban law.

The conduct of the Cuban President is in sharp contrast with the act of General Wood in granting a ten-year concession to that shameless institution of gambling, the Jai Alai Company. This concession General Wood granted just three days before turning over the government to President Palma. Within the same brief period he was offered and received a $5,000 present, which all parties in Havana with whom I have talked assert was purchased by the men of the Jai Alai Company. The pleas made in abatement by the friends of General Wood in the United States are laughed to scorn here, and with justice as it seems to me. The Jai Alai institution is one of the meanest forms of gambling, and would not be tolerated in any city of the United States for one hour. Nor would it be tolerated by the Cuban Congress and President Palma if they could help themselves. But when they have indicated a purpose to undo the nefarious

concession the Platt Amendment has been shaken in their faces, and they have been told it is an act of the "intervening government," which is covered and protected by that famous amendment.

Could anything reflect more discreditably upon our Government than that it should be placed in such a position of sponsorship for a gambling concern which the Cuban Government would destroy if it had a free hand? Was the Platt Amendment designed to be perverted to such base ends? Cannot the Congress of the United States by some act of modification or statute of construction of the Platt Amendment give the Cuban Government enough freedom of action to extirpate this abomination? Shall our Government be disgraced and the Cuban people damaged for ten long years by the continuance of this detestable franchise and the maintenance of this den of blacklegs?

A Congressional committee ought to be sent to Havana to investigate this whole transaction, and report a remedy. Our country cannot afford to occupy any such position as it now occupies in this matter.

Scarcely less reprehensible is the settlement made by General Wood of the property question between the Cuban people and the Roman Catholic Church. The Cuban Congress is warned in the name of the Platt Amendment that it cannot rectify the wrong involved in that transaction. No honest man would have the Roman Catholic Church robbed of one penny to which it is rightfully entitled, and no honest Catholic would wish his Church to receive into its possession a corrupt centavo. Yet it scarcely admits of a doubt that property which justly belongs to the Cuban Government has been turned over to the Catholic Church, and for its use the Government must pay a large monthly rental. When the Cuban Congress would take hold of the matter it is confronted with the Platt Amendment!

Was the Platt Amendment designed for any such purpose? I dare say its distinguished author and the American Congress never for once dreamed of such an application of it.

The amendment, which was designed for wise and good ends, and which ought to have become the embodiment of the noblest impulses of the American people with reference to the relations of our Government with the Cuban Republic, will be made odious if it is made the impregnable shelter for the defense of these inexcusable acts of General Wood.

By some act of Congress, or supplemental treaty, our Government should without delay rid itself of the discredit which rests upon it by reason of these transactions. It cannot afford to inflict a gambling concern on the Cuban people, and put beyond the reach of the Cuban Congress a property question which that body has the right to settle for itself. Such intervention upon our part degrades us as truly as it damages Cuba. It amounts to the oppression of a people for whose liberty we professed to intervene, and the corruption of a nation for whose elevation we have expended vast sums and precious lives.

ATLANTA, GA.

Francis Petrarch. From a Print After Rafaelle Morghen. Engraved by Rob't Hart

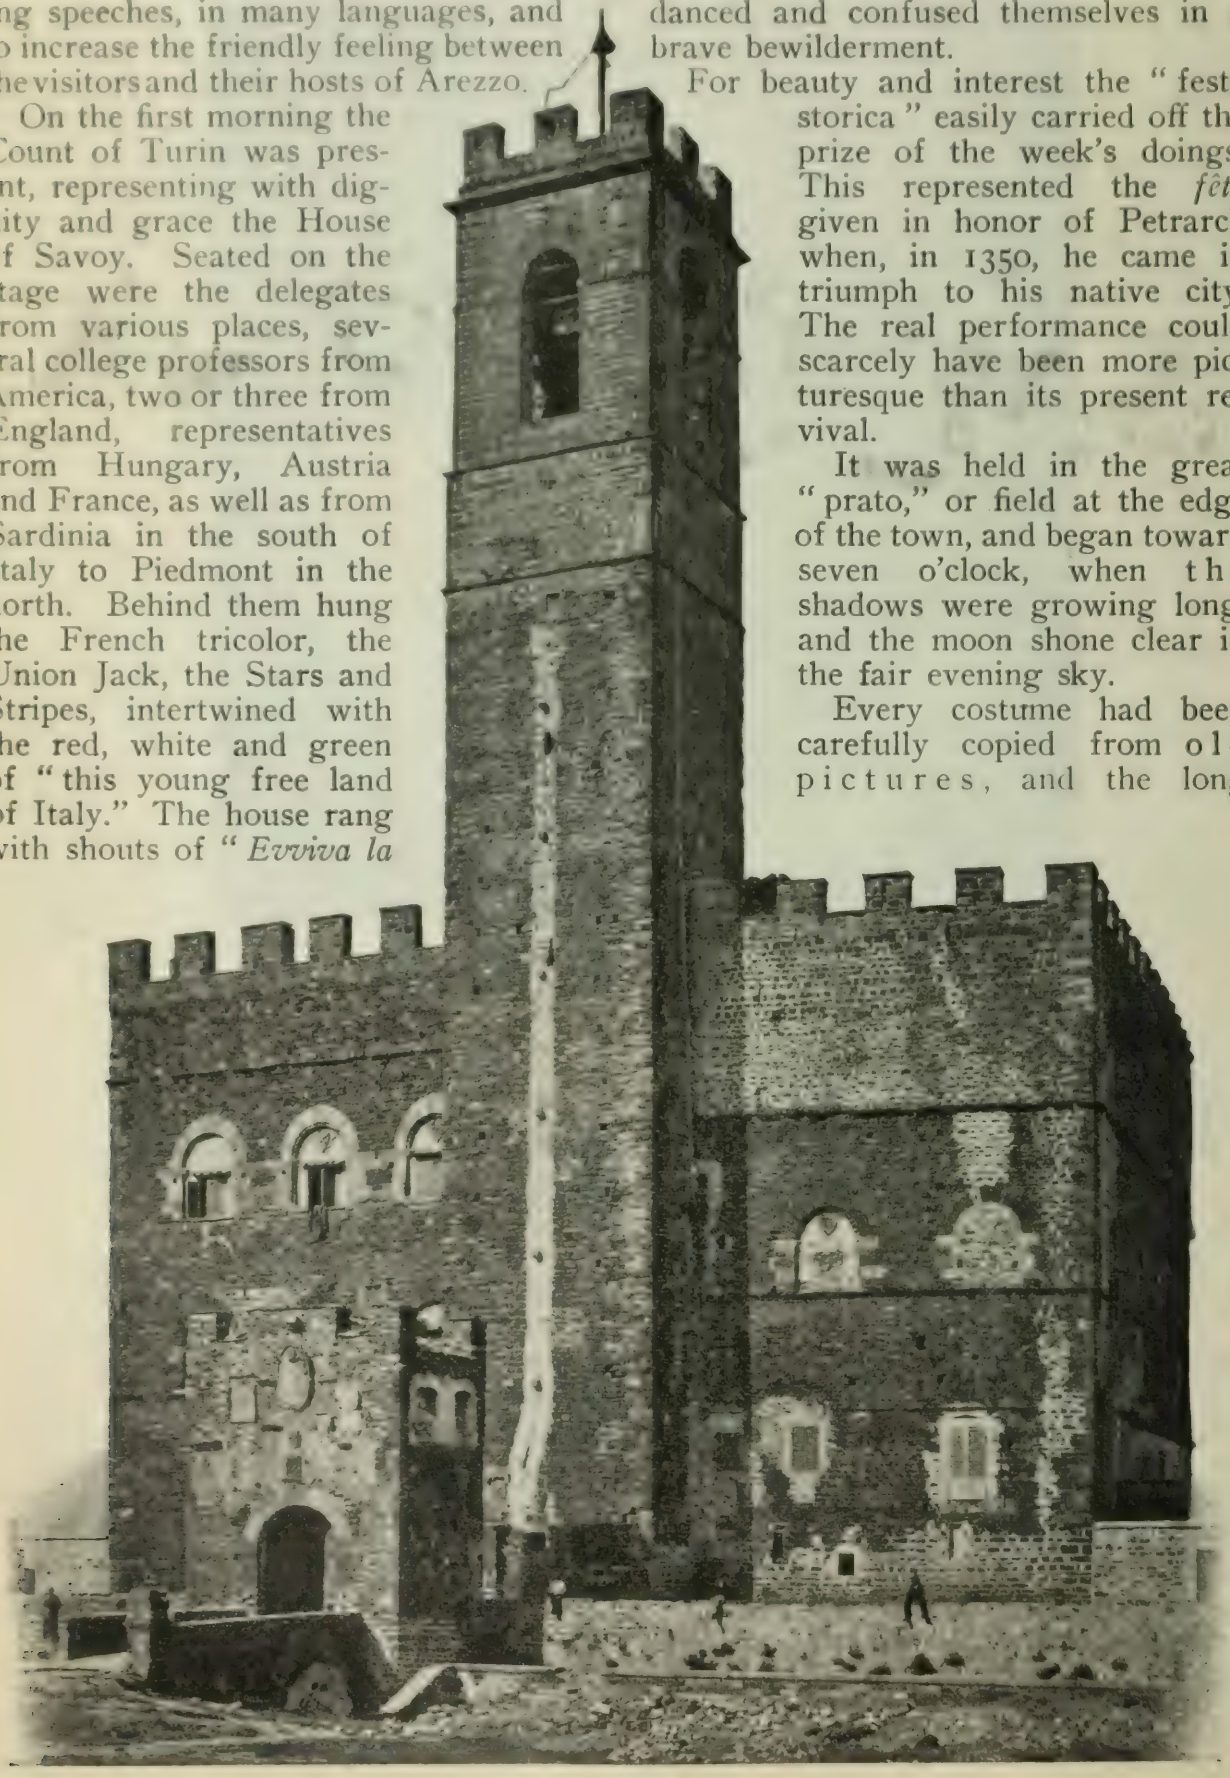
Petrarch's Six Hundredth Birthday

BY KLYDA RICHARDSON STEEGE

AREZZO, with its old, gray streets and walls, cannot have changed very materially since on that twentieth of July, 1304, was born the baby whose mind and heart in after years revolutionized the literary world. Here, in the same city which once sheltered Dante, was offered a home to the father of Petrarch, another exile from Florence; and here, on a night when this same father was joining in an unsuccessful attempt to re-enter the city which had expelled him, the little Francesco began his earthly pilgrimage.

It is unfortunate that the very house in which Petrarch was born cannot be determined, owing to changes and restorations in the neighborhood, and to the fact that all the archives of the city prior to the year 1384 are missing. But the street and neighborhood are known certainly, and so, when we assisted in putting up a tablet on the wall of the supposed house, we could be sure that it was nearly the right one, at any rate, and that the venerable walls may have been, after all, those which sheltered the famous baby.

It is doubtful whether the Petrarch Congress held during three mornings of



this memorable week arrived at any really new interpretation of the poet's works, or threw any fresh light on what was already known about him, but it served to call forth a number of interesting speeches, in many languages, and to increase the friendly feeling between the visitors and their hosts of Arezzo.

On the first morning the Count of Turin was present, representing with dignity and grace the House of Savoy. Seated on the stage were the delegates from various places, several college professors from America, two or three from England, representatives from Hungary, Austria and France, as well as from Sardinia in the south of Italy to Piedmont in the north. Behind them hung the French tricolor, the Union Jack, the Stars and Stripes, intertwined with the red, white and green of "this young free land of Italy." The house rang with shouts of "*Evviva la Francia*," "*Evviva l'Italia*," "*Evviva Savoia*." Then the Count of Turin bowed and smiled, the band broke out into the "Marcia Reale," and the school boys waved their banners until the colors danced and confused themselves in a brave bewilderment.

For beauty and interest the "festa storica" easily carried off the prize of the week's doings. This represented the *fête* given in honor of Petrarch when, in 1350, he came in triumph to his native city. The real performance could scarcely have been more picturesque than its present revival.

It was held in the great "prato," or field at the edge of the town, and began toward seven o'clock, when the shadows were growing long, and the moon shone clear in the fair evening sky.

Every costume had been carefully copied from old pictures, and the long

The Castle of Poppi, Thirteenth Century. By Permission of Fratelli Alinari, of Florence

A Fourteenth Century Group

procession as it wound around the field might have stepped from the frescoes of Benozzo Gozzoli. First came the heralds, followed by trumpeters and pipers, standard bearers and the Podestà. After him, his family, then other dignitaries in robes of office, pages, judges, captains, priors and scholars in long, flowing mantles and scarlet caps like that of Dante in the Bargello portrait. Finally came Messer Francesco Petrarca himself, on a white horse led by pages, bowing and smiling, and looking extremely pleased with everything. Following him came "noble Romans," soldiers and a crowd of the people, finished off by a mob of little boys, regular street urchins of the Middle Ages, who. in spite of their antique dress, ran and shouted as boys of all ages always do.

The whole company, having made a detour of the field, seated itself at one side, and the soldiers in armor came on at full gallop, to give an exhibition of their skill in an old game, very popular in medieval times. This was the "Joust of the Saracen," and consisted in tilting with wooden lances at a huge figure of a Moor, planted in the middle of the field. "A Moor," as an Italian writer says, "because the Moors were the enemies of all Christian and of knights particularly." These modern knights of Arezzo were picked cavalry soldiers from Florence, and the exhibition they gave of riding and keeping rather restive horses under control was something of which to be proud. But the dusk was increasing, and the moonlight was growing bright, and night would soon shut down over everything. So now a chorus, selected from the quaintly dressed throng, began to sing the words and music which had been composed in praise of the genius of Petrarch. This music, changing abruptly from a minor strain to one of joyous gayety, which again rose and fell to die out softly and almost sadly on the quiet evening air, had an indescribable and enchanting effect. As the light grew more dim, the whole scene, with its strange colors and accessories, and sounds of music, was like a dream, and seems so to me now as I recall it.

The next morning all the invited guests of Arezzo went by special train and carriage to the ancient town of Poppi, where, in the ruined but now

partially restored castle of the Guidi, we were entertained and welcomed where Dante was once a guest. We were taken to the remarkable library of Poppi, which, in this town so small and so old, is a wonderful thing to find, were it not that the whole of Tuscany is so full of treasures of long ago learning and art that nothing seems very surprising.

This is, of course, all Dante country, and we drove on, full of memories of his exile years, to the historic castle of Romena, where he passed many days of waiting and longing, gazing out over the Casentino, the valley through which runs the Arno down to Florence, whose closed gates will never open to let him in.

Our host, Count Goretti, the owner of the castle, offered its hospitality to us, and in the long unused courtyard at one side of the great, ruined towers we sat, under an improvised roof of green boughs, and ate and drank and listened to speeches. Behind and beneath stretched the wonderful prospect of this beautiful Tuscan country, and we turned from the present Italy back to the memories of the great men and the great past which hung over the scene. Then a fresh toast brought us back again to the liberty and patriotism of united Italy, and to the pleasant friendships formed during the days in Arezzo.

ALASSIO, RIVIERA DI PONENTE, ITALY.

Captured by Moorish Brigands

BY CROMWELL VARLEY

[The story of the capture of Mr. Perdicaris by Raisuli's band has nowhere been so well told as in this article by his stepson, Mr. Varley, who was captured with him. The accompanying picture of Mr. Perdicaris in Greek costume was taken some years ago.—EDITOR.]

ON Monday, May 16th, 1904, Mr. Perdicaris and his family, which included the writer, left El Minzah, our house, just outside the walls of Sangus, to spend, as we fondly imagined, a peaceful summer at Nidonia. On the following Wednesday evening, while sitting in the drawing room conversing after dinner, we were startled by piercing shrieks issuing from the servants' quarters. We imagined a servants' quarrel to be taking place, a not unknown occurrence with our cosmopolitan staff, and running round to intervene found ourselves in the midst of Raisuli's mountaineers, who had entered the house by the back door and occupied the approaches to the servants' quarters. Various means were adopted to impress upon us the futility of resistance, and we soon found ourselves at the soldiers' lodge, our horses being already there. Raisuli handed to one of our soldiers a letter for Hadj Mohamed Torses, the Sultan's representative at Tangier, and saying in a tragic voice that would have put to shame some of our accomplished artists, "I am Raisuli!" We mounted and set forth on a ride which proved to be one of over 26 hours.

I ascertained during our sojourn among the Beni Aroos that Raisuli and his mountaineers came to the neighborhood of our house during the night of the 17th, and lay concealed during the day among the brushwood outside our property, which he entered after nightfall on the 18th. There can be no doubt that he was in connivance with some if not all of our natives, as neither our dogs nor our peacocks, the which give rise on ordinary occasions to the weirdest sounds on the slightest possible provocation, gave us the slightest warning. I am convinced that had we been warned, and fired but one shot before Raisuli and his men entered the house, they would have fled. This shot, however, was not fired, and consequently we spent over five weeks in the hills of the Beni Aroos.

On leaving our property we crossed

the road that runs from Tangier to the lighthouse at Cape Spartel, and rode down the mountainside. Tumbling into water courses, over bowlders and breaking through the brushwood in the dark, we gained the plain below, and after a hurried and whispered consultation among our captors, struck across the open country in a southeasterly direction.

Raisuli took us by a round-about road in order to avoid as far as possible villages, plow lands and places where we might meet people, and he showed an almost feverish haste to push along until we had crossed the borders of the Beni Aroos territory. In fact, the few short halts made during the night and the following forenoon and early afternoon were grudgingly conceded at my insistence on behalf of my companion, whose fatigue and stiffness, aggravated by a fall from his horse, rendered rest absolutely indispensable. There were times when I almost despaired of getting him further.

Ion Perdicaris in Greek Costume

During the morning we wrote a note, which Raisuli sent back to Tangier for us, and later we had a short rest and a little bread and muddy water, our only provisions during the journey. About 4 o'clock we crossed the border of the Beni Aroos, and coming to a halt we spent a much needed half hour beneath magnificent evergreen oaks and among some grand rock work, a most charming spot, visited, however, as far as we were concerned, under anything but engaging circumstances.

A long climb by an execrable road brought us to a pass among rocky peaks of great wildness, and in keeping with the rough mountaineers accompanying us. We filed through this pass and then commenced a long descent down a rugged road, until, leaving a village on our right, we came to a halt on some pasture land along the foot hills we had traversed. Here we rested for a couple of hours, after which a short ride through the moonlit landscape brought us to Tserredan.

We were shown into a Moorish hut of two rooms, with thatched roof and mud floors. The inner one, a room of about ten feet by eight, had a raised floor and a ceiling of mud carried on canes and rough joists so low that we could not stand up in it. There was a small unglazed window with wooden shutter, and a cranky door about four feet high between it and the outer room, which served indifferently as our kitchen and bathroom, and bedroom for the Moorish servant who had voluntarily accompanied us. As a bathroom it left much to be desired, the mud floor under the process of bathing out of a leaky camp kettle becoming an ever increasing quagmire.

The Friday following our unceremonious departure from the family circle brought us our first mule load of stores. and letters from home telling us that all were well, and our one real trouble, our anxiety on behalf of those we had left behind, was removed; and such was their consideration for us that we were, until our return, under the impression that they had not even been touched.

Mattresses and bedding soon followed, and the swarms of vermin that shared our quarters with us began to give way before the use of insect powders sent us.

We were confined in our hut for the first few days, until, in fact, the afternoon of the Monday following our capture, when we were allowed to stroll on a grass covered plateau outside the inclosure in which our hut stood. It was not, however, until we had been walking about, stretching our limbs for some time, that we realized to what our greater freedom was due, not, in fact, until we saw the long line of mules and men accompanying our friends, the young shereefs of Wazan, Mulai Ali and Mulai Ahmed, filing up the mountain path beneath us. Soon after their arrival they were seated with us in our close quarters giving us the news of Tangier. The younger brother, Mulai Ahmed, soon returned to Tangier, when Mulai Ali pitched his camp a little above us and lent us a tent and furniture; and his cook and waiter managed the commissariat in a style that was simple luxury in comparison with the somewhat primitive capabilities of the mountain village. Our circumstances were now very much improved, and remained so until the end of our stay; and shifting my sleeping quarters to the tent—my stepfather electing to remain in the hut—we both had room to stretch without mutual inconvenience.

I naturally endeavored to gain what information I could concerning the people we were among, but found it very uphill work, as instanced below. A man, the sheik, or head man, of a neighboring village, came to visit Tserredan, and I thought it a possible opportunity to pick up information. I asked him many questions, to which he gave me ready answers. When finished, and walking away, I received a sign from one of Mulai Ali's men sitting by that the man had not been speaking the truth. I consequently let the matter drop for a day or two, and then repeated my questions. A mountaineer sitting by warned the sheik that he had already answered the questions and bade him be careful; his memory, however, was faulty, and I got different answers to each question. This tribe had numbered 5,000 fighting men on the first occasion and 7,000 on the second. I told him that the rate of increase of fighting men in his locality was unknown elsewhere, and also liars of his caliber.

We were amused to find natives coming from neighboring villages to have a look at us, never having seen a European before.

Raisuli treated us with consideration, tho he kept us very closely guarded and watched, he and his immediate following being fearful lest some neighboring tribe should carry us off and do the deal with the Moorish Government for our release on their own account.

A Moorish doctor who spent a day at Tserredan on his way to a village of the Bene Gofat to attend a man who he said had received a Martini-Henry ball in his arm two months previous to the time in question, told us a somewhat amusing tale of how he performed amputations by painting some liquid obtained from Turkey round the limb once a day for eight days, until it withered off. It was, I imagine, a reply to my statement, when fossil hunting and the natives asked me what I was looking for, which was that I was looking for "petrified fish," which no doubt seemed to the mountaineers somewhat startling.

On the 24th of June we left Tserredan at five in the morning, and, riding through the Beni Iedes country and Beni Emsour, arrived at Bu Rabish in about six hours. Here in the house of Lalal, the chief of the tribe, a comfortable Moorish hut and clean, we lunched, and the final business being transacted between Raisuli and Mulai Ahmed, who had come from Tangier to meet us for this purpose, we joined his followers, some 50 rifles, and my companion in a mule litter brought for him, we started for Tangier at three in the afternoon.

We dined a la Belle Elvile, on a farm of Mulai Ali's, about an hour's ride from Lunats, which village, containing Raisuli's house, was burnt by the Sultan's forces after the Harris affair was concluded. At ten we remounted and rode into Tangier at 12.30 that night, and the pale, wan faces that met us told of the anxiety our month's captivity had given them.

TANGIER, MOROCCO.

Loss and Waste

BY JAMES JEFFREY ROCHE

I ASK for no closer season
  Than our higher law has made;
But I pray, in the name of reason
  And the holier name of Trade,
That the reckless haste and the sinful waste
  Of our noblest sport be stayed.

The lobster is well protected
  Till he reaches his crusty prime;
The salmon is not neglected
  In his vulnerable time,
And the poacher of bird or beast is stirred
  With fear of the cost of crime.

But the sport that wakes every passion
  Of the Anglo-Saxon frame,
That is all the year round in fashion
  And never grows dull or tame,
We follow with zest, but drop at the best
  And practical part of the game.

The African in his jungle,
  The Fijian on the beach,
Their logical minds ne'er bungle
  The duty beloved of each—
Which is, that you eat when you've killed your meat,
  And have it within your reach.

We have mastered the art of killing,
  Quickly or by degrees;
Our torture is more than thrilling;
  We scalp and we flay with ease;
But the 'Pache and Sioux before us knew
  Such primitive things as these.

But I think of a thing more cruel,
  From a business point of view,—
That we waste so much costly fuel
  In roasting a nigger or two,
And have not the wit, or gumption or grit
  To finish our barbecue!

BOSTON, MASS.

National and Clerical Education in Spain

BY SENOR MIGUEL DE UNAMUNO

[The University of Salamanca, of which Señor de Unamuno is rector, is nearly five hundred years old, and had great fame in the palmy days of Spain. This article vividly illustrates the difficulties which those must meet who are trying to revive the wasted intelligence and energy for which this country was once so famous.—EDITOR.]

EVER since the war through which we lost our colonies it has become the the fashion in Spain to speak of the need of reforming public instruction; people insist on the great number of those who can neither read nor write—half the adult population of the country—and the schoolmaster, a generally most neglected entity, has acquired great importance. Nevertheless, all this is more in the word than in the feeling. The State, yielding to this tendency, principally manifested in the daily press and the reviews, has finally decided to take upon itself the payment of all the charges for primary instruction, which were formerly looked after by the respective municipal corporations. In pursuance of the above, since the beginning of the present year, the Government has decided that there shall be no school with less than $100 appropriation per annum; but the rural villages in general look upon this unfavorably, claiming that their poverty does not allow them to contribute such a large sum of money to the instruction of their children.

Señor Silvela's recent declaration that the country does not want public instruction created great scandal among the "intellectuals" in Spain, but all those who, like myself, are in a position to know the feeling of the people, aside from the opin-

ion of the "intellectuals," know how truthful, unfortunately, is that asserion.

Among the rural families the children are in many cases simply retained at home and never sent to school; they are made to mind their younger brothers and sisters, or employed in household duties or agricultural work. The school at best is considered as a place where the children are kept locked up and prevented from tearing their clothes or damaging the newly planted fields.

In a certain little village where the people refused to improve the conditions of the schoolhouse, unhealthy and too small for its purpose, they argued to me in reply to the teacher's complaints:

"The good woman pretends to love our children even better than we love them ourselves! It does not matter whether she teaches them or not, but she should keep them out of mischief. During these days, when, under pretense of unhealthy conditions, she has kept the school closed, my son has actually torn two pairs of boots; and matters cannot go on like this."

People have no belief in public instruction in this country and far less in hygiene. The need of public instruction has not penetrated into the soul of our rural population, nor that of soap either. If they seem to acquiesce in either case it is because they dare not contradict what they hear so highly praised. In the matter of learning itself, it is their firm belief that the poor man has quite enough if he knows how to read and write, the four elementary operations of arithmetic (adding, subtracting, multiplying and dividing) and, above all, the Catechism or Manual of Christian doctrine and sacred history. Anything beyond that is not only superfluous, but may be harmful. "Send us a teacher who will teach the Christian Catechism well, and who on Sundays will take the children to mass, even tho he may teach nothing else; for that is quite sufficient here," so I was told by the worthies of a village. I know of a certain bishop who upheld the above theory in talking to a school teacher upon whom he called during one of his episcopal rounds.

There are many among us who believe that the "poor in spirit" who shall be "blessed" are the ignorant, and it is not rare to hear ignorance defended in one shape or another as the great bulwark against liberalism, which is a sin, at least in Spain.

The worst is that the clergy do not comply with their orders according to which Spanish priests should attend the schools every Saturday to teach the Catholic faith to the children. Very few of them do this, leaving the work to the teacher, whom they blame and even actively molest and persecute if he does not give the teaching to their satisfacion.

The Church, out of which sprang our universities, hardly pays any direct attention in Spain to-day to matters educational, except as they are left to the religious orders, which have practically become the sole masters of secondary education, of a great part of the primary education in the large cities, and also of a considerable part of the higher education. Within recent times some of their privileges have been curtailed. Those who give private instruction have been compelled to show that they possess sufficient academic titles. They pretend to take their pupils to the official examinations, but they have these examinations conducted by the pupils' own teachers. They have now been compelled to take their pupils to the official institutions to be examined there, instead of having it done by official commissions sent to the private colleges, as was formerly the case, which lent itself to great abuse.

Speaking with all frankness, it is necessary to declare that the education given by the religious orders in Spain is, generally speaking, detestable; that it aims solely at educating the pupils in external religious practices, and at guarding them from contamination with the liberal virus, while carrying out all the time a most lucrative industry. Their colleges are principally institutions for the production of academic bachelors, whose work is carried out with no other end in view but the honorary degree which they may obtain from the institution itself. And that is very natural. The Spanish Church has always distrusted the education of the people, seeking to prevent its overstepping certain limits. We have with us an inherent Inquisition, as it were. There is in the most popular Catechism of Christian Doctrine, the one written by Father Astete, a reply to a certain question which is most significant:

"Do not ask that question of me, who am an ignorant man; the Holy Mother, the Catholic Church, has doctors who will be able to answer."

That is the national leprosy which afflicts us: everything is delegated. From no quarter do we hear with greater frequency than from the clerical element that "the shoemaker should stick to his last." They see an enemy in any one who, going beyond the strict limits of his professional studies required by immediate application, "meddles with matters that concern him not." A physician who abandons his practice and devotes his time to biological investigation, a lawyer who studies sociology, incites suspicion. I know of a university professor, an Ultramontane, who, when a psychological experimental laboratory was started at the university, declared that such a thing was nefarious and sure to lead to materialism. Not long ago the Bishop of Guadix protested in the Senate against the taking of anthropometric measurements of the pupils in a gymnasium on the ground that it was contrary to human dignity: so he said, but the real fact at the basis of all this is that they see a danger to Spanish orthodoxy in any class of investigations.

For the above reasons I have always believed that what I will call the *practicism* preached by so many Liberals, ever since our military disasters, is at heart a weapon unwittingly placed in the hands of the reactionaries. "What is required," so we are told, "is less graduates or doctors, and more men versed in industry; less Latin and more pharmacy; less universities and teaching institutions than at present, and more commercial or industrial and engineering schools." For my part I believe that it is not the industrial schools that create industry, but that the latter creates the schools, and that our industrial schools will only give us industrial graduates like the others, or worse than those. I believe, furthermore, that it is the mind that we should educate and elevate in Spain, not delegating everything, but, on the contrary, "meddling with what concerns us not," and that we shall have neither industry, nor commerce, nor roads, nor irrigation, until we shall have shaken off the spirit of the Inquisition and shall have arrived at the Peace of Westphalia, having passed before through our Diet of Worms and the wars consequent thereon.

The fact is that the religious struggle has not come to an end in Spain, but that, on the contrary, it has to-day as much as, or greater importance than the economical and social problem. The struggle increases in violence. We live in the midst of an armed civil peace, but open warfare would be preferable, as pneumonia is preferable to consumption. The liberty of the human conscience is at stake in Spain; the fullness of that liberty remains still to be conquered, and the question presents itself specially in matters appertaining to public instruction, the legal status of which is ambiguous.

The Concordat signed in March, 1851, between his holiness Pius IX and her majesty Queen Isabella II, which is in force at present, stipulates in its Article 2:

"The instruction given at the universities, colleges, seminaries and public and private schools, of any class whatsoever, shall be in strict conformity in all its details with the doctrine of the Catholic religion, and for this purpose no obstacle shall be set to the bishops or other diocesan prelates intrusted by their ministry to watch over the purity of the doctrine of the faith and morals of the people, and over the religious education of the young, in the exercise of their duties, even in the public schools."

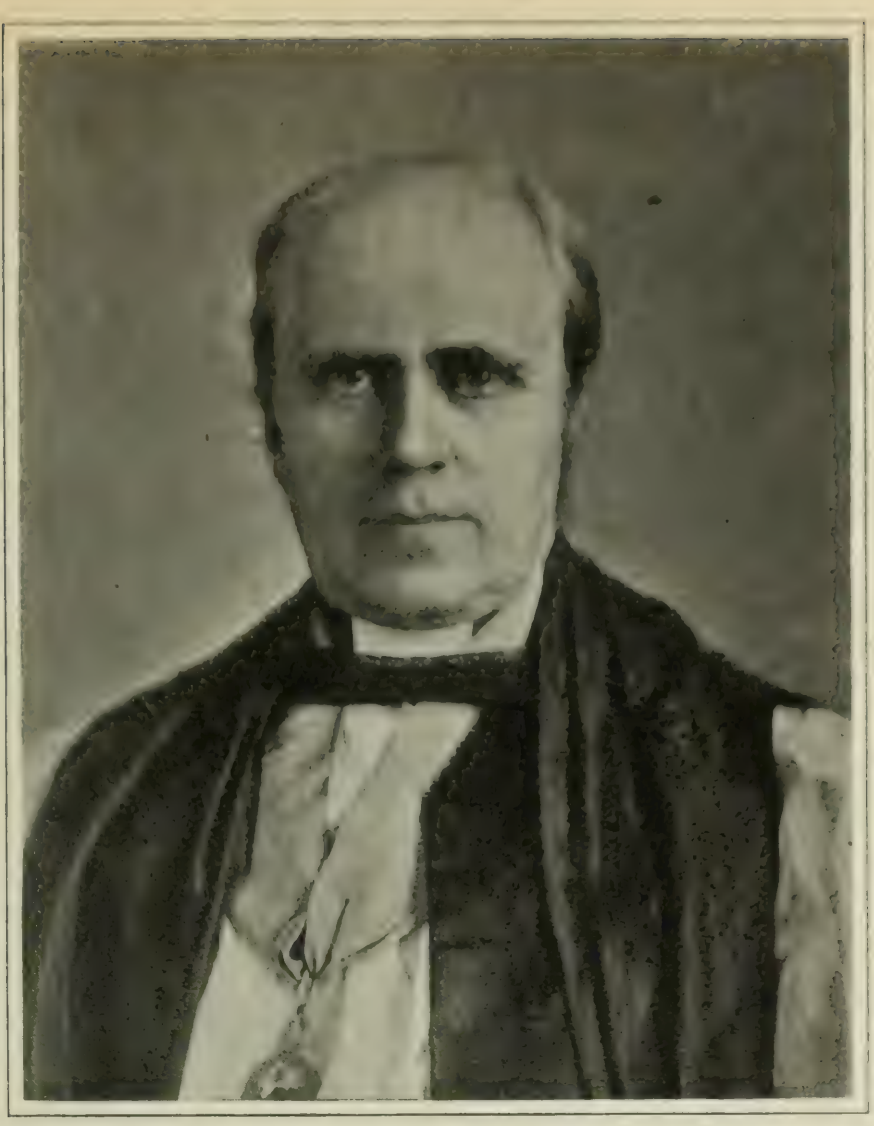
In accordance with this the Law of Public Instruction of 1857, which is the one in force, stipulates that "the academic functionaries shall not put any obstacle to prevent the bishops from inspecting the doctrines that may be taught," and "whenever a diocesan prelate shall find in the text books or in the explanations of the professors the utterance of doctrines prejudicial to the sound religious education of the young" he will report the matter to the Government, so that the latter may take the required proceedings.

Later on, the Constitution of 1876, which rules in Spain to-day, declared in Article 2:

"No one shall be molested in the territory of Spain for reason of his religious opinions, nor for the exercise of the religion, provided the due observance of Christian morality be maintained."

In Article 13 the Constitution establishes that every Spaniard has the right to the free utterance of his ideas and opinions, spoken or written.

Before the promulgation of that Constitution, in February, 1875, immediately after the restoration of the Bourbon dynasty, the then Minister, Señor Orovio, ordered that no other teaching but the official teaching of the State should be given by the professors, in consequence of which several professors were deprived of their chairs. Orovio was a Conservative. On March 3d, 1881, the Liberals being in office, the then Minister, Señor Albareda, canceled the inquisitorial decree of his predecessor, Orovio, and reinstated the deposed professors, paying them their salaries during the time of their enforced absence. Thus the precedent of the freedom of the academic chair was established; it holds up to the present day and has managed to resist since then the attacks of the clerical element.



I say up to the present, because in Spain no one can answer for what the morrow will bring; no one can say if some Government will not take it into its head to revive the Concordat and the Law of Public Instruction, both of which are extant, acting against the Constitution itself, and to argue that, altho every Spaniard has the right to profess and expound freely whatever religious doctrines or others he may hold, the State cannot retain in the academic chairs as official professors, paid out of the public moneys, those who may expound doctrines contrary to what is stated to be the doctrine of the State itself. In fact, it is not so much the Constitution as the public spirit that prevents in Spain such an enormous outrage and the resurrection of such obsolete principles.

The immense majority of the nation, composed of illiterates or little better than that, does not think for itself and has no opinion on religion, education or politics; it delegates them. It is a minority, and a very small minority at that, which constitutes the conscience of the nation and also constitutes public opinion. To ask to hear what the majority has to say, instead of simply limiting one's self to the stating of what that majority needs, would be as if a veterinary surgeon waited for the ass to bray before medicating it. The majority of that conscious minority is Liberal in its tendencies and scarcely orthodox, tho it may profess to be Catholic out of routine and the preservation of appearances. It must be confessed, however, that the majority of Spanish university professors do not belong to the enlightened Liberal minority, and that it is in the State universities principally where are to be found, outside of the clergy, the intellectual elements of strict orthodoxy and anti-Liberalism. But it must also be confessed that the best and most distinguished representation of Spanish intellect is not to be found among the official professors, but outside of their number, principally in the press, in that press so hateful to the clerical elements, and upon which the Universitarians of the old school look with such unfavorable eyes.

Tho with great difficulty, dragged, as it were, our universities and institutions will have to follow the current of the century, and cease to be academic factories of bachelors and doctors, to become centers of supreme culture and laboratories of real learning. Our most liberal university, that of Oviedo, is the one most advanced in the new direction, thanks to the nucleus of liberal professors, against whom the bishop of the diocese, a Dominican friar, urges constant war, having founded a daily newspaper for the principal purpose of combating those professors.

The religious orders teach, because they have to take their pupils to be examined at the official centers, and in competition with these latter. If, freed from official competition, the religious orders were to become sole masters of education, everything would come to an end. Under the pretense of teaching, only the most summary education would be given, and we would enter fully into the period of "Ask not such questions of me who am an ignorant man, for the Church has doctors," etc.; a brutifying *praticism* would prevail over the land. Bad as it is, the official instruction given by the State is to-day in Spain the only thing that deserves the name of instruction. All true Spanish Liberals understand that we must raise the flag in the battle for national culture in the "*Kulturkampf.*"

SALAMANCA, SPAIN

THE ARCHBISHOP OF CANTERBURY

The Archbishop of Canterbury

BY THE REV. T. W. WINFIELD

THE Most Reverend Randall Thomas Davidson, Archbishop of Canterbury, has issued a statement in reference to his visit to this country. He is expected to reach New York on Saturday of this week. He will be present at the General Convention of the Protestant Episcopal Church, to be held in Boston in October, when matters of deep interest to the Church will be considered.

The Archbishop will also visit some of the Canadian cities where the relations between the Mother Church and the Colonies are still strong enough to dictate the same forms and methods of Church polity, doctrine and worship as in the Church of England.

It may be a surprise to some to learn that the Archbishop occupies the highest position in Great Britain next to the Crown and the immediate descendants of the King. He takes precedence after the Prince of Wales and his son, and above all Dukes, Earls, Viscounts, above the Lord Chancellor, the Premier and the Secretary of State and all Ministers from other countries to the Court of St. James. Even before the Reformation the occupant of the See of Canterbury outranked all other archbishops; and several occupants thereof are among the calendared saints of the Roman Church—the most notable of them all being Thomas à Becket. Indeed, apart from St. Peter's

at Rome, there is no ecclesiastical office so rich and hoary in tradition as the See of Canterbury.

The prerogatives of this office include —besides the magnificent palace and princely provision made for its occupant —the administration of the affairs of state should any lapse occur in the reigning power. In such a case the Archbishop would be the head of certain dignitaries (including the Lord Chancellor and the Premier) who discharge the functions of Royalty in the interregnum. It is generally supposed that the last time that the necessity arose for such a Commission was after the death of Queen Anne and before George I could reach England. There is, however, a later royal document given by George himself authorizing the Archbishop and twelve Lords and gentlemen whose names are mentioned to exercise the royal authority during the King's visit to Holland.

The Archbishop has been under a considerable strain for some time past, and, Scotchman tho he be, there are times when some relaxation becomes an absolute necessity, and His Grace is likely to find in his visit to this country that change which is restful, and that rest which is not in danger of being disturbed by churchly questions, which are vexing alike to flesh and spirit. He will be welcomed here, not only on account of his high position, but as a tribute to the personality of the first Primate of all England who ever crossed the Atlantic.

Meanwhile, there will await his return many matters of grave import. A Royal Commission has already been appointed, one purpose of which, according to Mr. Balfour's statement, is "to investigate the ecclesiastical disorders in the national Church."

The hymn commonly called "The Athanasian Creed" will be one of these matters. Concerning this compilation most men are agreed in regard to certain details—namely, that its authority is shrouded in mystery. Whether it shall ever have an "end of life" remains to be seen; it did not have an ascertained "beginning of days." When it appeared it came as a document of authority, and complete in its Latin form. St. Hilary of Arles is commonly designated as its author, but this is disputed. St. Athanasius, who died in 378 A. D., had certainly nothing to do with it; it was supposed to express his views, and therefore came to bear his name. It is not referred to in any of his writings, nor is it mentioned in either the Third or the Fourth Council of the Church. Yet, from the eighth century until the seventeenth it was regarded as the work of Athanasius, until Literary Criticism decided that Athanasius never could have done it, that its birthplace was Gaul and its original language Latin.

Men object to it because it is not in the true sense catholic. It is not commonly "received and believed." There is not a single Church, East or West, besides the English Church and the churches of the British Colonies that follows the English practice, which recites this "*Quicunque Vult*" in the services of the Church and in a language "understanded of the people."

The Protestant Episcopal Church of this country has never had it, and has never needed it. No book of Common Prayer since the Revolution has contained it. The members of that communion have reverenced and loved the two creeds they have, and have not missed that which for 180 years has been the battleground for theological combatants of varying degree of understanding and unwisdom.

The Eastern Church never uses it. It is inscribed, indeed, in her Horologion, or Canonical Hours, but it is a dead letter so far as usage is concerned.

The Roman Catholic Church has the "*Quicunque Vult*" inscribed in the office of "Prime," which service is chiefly for the clergy, the "religious," and students for the priesthood. The people may attend, of course, but they scarcely ever do, and, of course, it is said in Latin and not in the tongue of the people.

Of all the great host of Christians outside the Episcopal and Liturgical churches there has never been a question as to this Hymn or Creed. It has never been used, and never will be used. In the Protestant churches there have been many divisions, bigotries and puerilities, but we do not know of any sane man who would have the effrontery to dictate a forbidding formula, which he calls the "true faith," and then proclaim that un-

less each man held it "whole and undefiled without doubt he shall perish everlastingly." Therefore we say the "*Quicunque Vult*" is not catholic. It is not generally received in the Church nor recited by its members.

Now, it is this question, among others, that has been vexing the Archbishop's soul. There is a large party in the Church calling out for a revision, or expurgation, of the "*Quicunque Vult.*" Some would leave out the "minatory" clauses and retain those which refer in detail to the attributes and Being of the Trinity. On the other hand, there is a strong force declaring that to touch it or to interfere with its place in the usages of the Church would be to cause disorder, and perhaps disruption, in the Church.

A few weeks ago a deputation holding these views waited upon the Archbishop; and in His Grace's reception of and answer to them the Primate shows both his diplomacy and his strength of character. The deputation was led by Canons Randolph, Newbolt and Cook, and consisted of many men of authority both in Church and in State. The petition was signed by 225 clergymen and 131 laymen (note the disparity in numbers), and set forth that "the present time was inopportune for any change, that there was a tendency to put opinion in the place of dogma, and that such action would cause a split in the Church of England."

It was charged that "the Bishops had receded from their first position," and the Primate made this latter charge the occasion for a full and clear survey of the whole question. It was a delicate task, for it could not be denied that the attitude of the petitioners was somewhat antagonistic. It was a time when the least lapse might provoke attack. The Primate ignored the doctrinal aspect of the question, and dealt with it solely from an administrative point of view, showing that there were many men who, tho opposed to each other, were "alike good, earnest, faithful and competent." He protested against the statement that those who did not agree with this parti[illegible] delegation were men "holding peculiar views," as had been alleged. Men did not think alike on this or any other subject, and he referred to many quiet Church people who held their convictions strongly without writing about them, and also to many who had strong objections to the use of this particular Creed. These people could not be slighted, even if they felt that some modification was necessary. He would consider it cowardly on his part if he hesitated to avow on which side his personal leaning lay. He recognized the strength of the argument to which he had gratefully listened. It was of the utmost value that he should receive the views of all kinds of thinkers, tho he might still adhere to his conviction as to the necessity of a change, not as to the contents of the Creed, nor as to the retranslation of it, but as to the manner and times at which it should be used. The Primate made very clear the determination reached by the Bishops. They had decided that no definite proposal for a change in the use of the Athanasius Creed should be made until a deliberate opinion had been more clearly ascertained.

In consequence of the Primate's connection with this whole matter (he having been the historian of the Lambeth Decennial Conference), it is fitting that this much should be said concerning the attitude he has taken. During his Lordship's visit he should be unhampered by vexatious questions, even if when he returns it should be decided that the "*Quicunque Vult*" should be left in the Prayer Book, and never used.

New York City.

Housing for Children

BY CHARLOTTE PERKINS GILMAN

[With this article Mrs. Gilman ends her series of practical and practicable suggestions for improving the modern home. Now that contractors are building city homes by the block, who will be the first to follow out her suggestions? Our subscribers should read Mrs. Gilman's work, "The Home," which is a full exposition of the theories that suggest this article. The illustration was drawn especially for this article by Vernon Howe Bailey.—EDITOR.]

WE Americans are a practical people, surely. We are a progressive people, liberal, broad-minded, rebellious against tradition and the downward drag of old cutoms.

Yet there are wide areas of life where we might as well be Hindus for all the advance we make.

We have developed a breed of trotting horses which are the admiration of the world, we have bred the trophy tomato and the navel orange, and here is Mr. Burbank ranging easily ahead in playing tricks on nature, with his "plumcot" and white blackberries, his stoneless prune and pitless plum. In especial do we excel in two points—in a keen, far-sighted business sense and in mechanical adaptability. Also we are noted for our family affection and our general kindness of heart.

Why, then, with all this array of valuable qualities, are we content to leave three-fifths of our population without proper accommodation?

In the census average five persons are allowed to a family, two adults and three children. A growing population must have more than two children to a family, and we are growing. At the lowest computation our children constitute more than half the people of the land. Their mintenance, education and general shelter and protection is becoming every year more of a problem of civics, and good progress is being made in this line of study; but their housing is a problem in real estate, in building, a practical business proposition, which could be met on quite other lines.

The city is the place where these questions confront us, naturally, and in the city they must be answered first. Here in New York in a population of three and a half millions we have two million one hundred thousand children.

For this vast number of citizens the only provision made is civic—the parks, the schools and a few playgrounds. Their parents, of course, do not provide these accommodations for children—the period of parental supply is long past; if children were left to the sole care of their parents only the few rich would have schools, and even they would have no general parks and playgrounds.

Our rich men's children have finer clothes, and private schools, but even they must be pushed and pulled about the public streets and public parks—their parents can provide for them only a remote nursery and small backyard.

Poor and rich alike must mainly use the street for what outdoor life they get; and here the poor child has some advantage, for he is not herded by a servant, he has freedom of body and brain, and learns much more than the poor, dull baby in the white velvet coat and leggings.

But what a scandalous inadequacy it all is!

Here are these thousands and thousands of growing citizens, and here are the city fathers and the homebound mothers equally indifferent to their needs. Among the traditions we have not rebelled against, a superstition as old as those of Brahma and Vishnu is our complacent assumption that the home is the place for children. Perhaps it was, once. Perhaps the cave dweller arranged his excavation especially with a view to the advantage of the young. Perhaps the tepee of the Sioux or the many-celled hive of the Pueblo is planned for children—the peasant's hut, or the baron's castle, or the king's palace.

The Children's Playground on the Roof of the Ideal City Home

In that vast vague period of the Matriarchate, which antedates all history, there may have been homes made for children—but there are not now. On the contrary—the glaring and horrifying contrary—we build houses *to exclude children;* we do not want them in the home! Go about with a family of five children and see the attitude of householders toward them. Lydia Kingsmill Commander has shown us in THE INDEPENDENT this phase of the question with amusing conclusiveness.

Our houses are built and planned entirely and exclusively for adults, and in the more expensive ones children are frankly objected to—often prohibited.

Of course, we continue to have children, and they do live somewhere; so they must needs be huddled about in the accommodation for "grown ups," and turned into the street, with all its dirt and danger, in the care of the casual policeman or stultifying nursemaid.

We are so used to this, so helpless under the weight of age-old customs, that it never occurs to us that proper accommodations could be made for this large and important class of citizens.

We do not at the moment recognize what is meant. "Accommodation for children? What do you mean? What do they need that they do not have?"

If hard pressed we may admit that the street is not a safe or nobly educative playground; that the poor child runs horrible risks and that the rich suffers drearily in the benumbing clutch of an ignorant servant.

But our inert brains can see nothing else possible.

"They *have* to be in the street," we say, sadly—"they must have air. What other place is there?"

There is another place, even in the city; an unobstructed area, miles and miles of it, with the best air possible in the circumstances, and that is?—the roof.

"Roof—roof—but that is where you hang clothes—that is no place for children!"

No, it is not, at present. But it could be, it should be, it will be when we see the right and reason of it.

Take it from the private point of view: Here is a city lot and house. The lot is 100 x 25 feet, the house 25 x 75 feet, the yard 25 x 25 feet, and the sidewalk 25 x 10 feet.

Now the sidewalk and yard together give the child but 875 square feet, whereas the roof would give him 1,875 feet. In the street is dirt, noise and danger. In the yard is less light, less air and a sense of imprisonment. On the roof is the best air a city has to offer, all the sun there is, comparative quiet and security. But the private point of view is not the one from which to regard the child. One's own poor solitary private child or two, soon growing up to the longed for age when they can have circumstances to fit them, can never command the attention and respect which we must give to the bulk of our citizens—a steady, permanent class.

Your child grows up and becomes an adult and forgets his infant limitations; but children—the children of the city—remain continually, in their thousands upon thousands.

And the same roof—O, purblind parent!—will in course of years accommodate more than one child!

Now, suppose our house builders and investors in real estate should wake up to the fact that there was a market they had never catered to, a huge and influential patronage clamoring for proper provision.

Suppose, while your imagination is in use, that this enormous number of children were organized and influential—that they knew what they needed, and had the money to pay for it.

Fancy them forming a syndicate and investing millions in the building of houses which did not exclude adults, but did include children as the governing factor. What would they build?

Our imaginations refuse to work. We never in our lives gave a thought to the needs of children as a class—except as school children.

There we have, indeed, accomplished something. As soon as we consider them *as a class*—as a permanent class—we do make shift to meet their needs.

Now children at home are just as numerous and just as permanent as children at school. Why should we not give as much care to providing homes for them as we do to provide schools for them?

Now, to really stretch our minds to the

consideration of home accommodations for children. Let us take a city block in New York as a basis—nothing worse will present itself. If we can solve the problem in New York we can solve it anywhere.

This block represents an area of 160,000 square feet in this shape:

In this block there are, say, one hundred families; two hundred adults, three hundred children. This is not a passing incident, but a continual fact. That number of children are the permanent residents of that block. They may change individually—as do the adult tenants, for that matter—but as a class of residents they remain. Being the majority, it would seem reasonable that the place should be planned mainly with a view to their needs.

The needs of children, as distinct from those of adults, are mainly educative. The adult is a settled quantity. He or she wants a home wherein to rest after the day's work, a place of quiet, ease, comfort, personal expression. In all this, as part of the family, the child shares according to his powers. But the period of childhood has dominant necessities of its own.

To begin with the baby. He should have, besides proper food, shelter and protection from danger, the fullest means of growth, physical and mental. We dress our babies more with a view to our sense of beauty and to the protection of our clothes and furnishings than with a view to the care and free growth of the little body. If we, in our house building, provided proper apartments for babies, considering their smooth and normal development as the main thing, they might be very differently dressed, and wholesomely undressed most of the time.

For air, sunlight and quiet the roof and the floor under it are the natural place for the little ones. When a whole block is thus arranged we shall have an outdoor space of two-thirds the whole area—quite a park. One side could be for the infants, three for the older ones, who require more space.

For the babies the quiet sleeping rooms, bathing rooms not only for lavatory purposes, but with wide, shallow pools, where the delighted fatlings could play in the water for blessed hours when the weather was not suitable outside, baby gymnasia and general nursery accommodations. Above, within insurmountable high railings, there could be sun-gardens and sand-gardens, flower-gardens, too, of sorts, and, again, gymnasia, in the open air. Babies cannot, it is true, swing clubs and dumbbells, or do elaborate acts on ladders, but they passionately enjoy such physical exercises as they are capable of —pulling upon soft large ropes within easy reach, incipient swinging, climbing up and rolling down, and sliding; there are plenty of exercises in which the waking hours of healthy yearlings and two-year-olds could be passed in pure delight and great profit. No perambulators needed. The child could get the air and sun while stationary, and get real exercise when in motion. They do not like to be strapped in, smothered in blankets and helplessly pushed around. When asleep a baby can lie still; when awake he should be free to move. The perambulator is a device to keep the child tolerably safe and clean in our unsafe and unclean streets. When we have the sense to provide a place proper for babies they will not need these antiquated devices.

Our retinue of nursemaids, and the "unceasing care" which the fond mother gives are necessary while the poor baby roams among the elaborate furnishings of an adult home or the dangers of the street, but legitimate accommodations will simplify "the care of children" remarkably.

For the older ones the same general needs are to be met. Rooms suitable for child life, where their natural activity can cause no inconvenience to older people and where are provided opportunity and occupation for those activities, instead of expecting a child to be "good" in doing nothing, and calling it naughty for nearly all it does. As I have remarked in another place, mischief is a term we use to describe the natural interaction between a child and a home.

When children have homes really

planned for them they will do no mischief —there will be so many natural things to do.

The elements are a delight always—earth, air, fire and water—and with experiment and unconscious instruction they could play and learn from year to year, having a jolly good time every day.

Simply playing in water is occupation and education in itself under right supervision. A shallow swimming pool, chutes to slide down splashingly, boats to sail, all the games possible in this delightful media—there could be one such in every block. One carefully fitted gymnasium, too; but, mainly, large playgrounds, with little individual garden boxes and suchlike provision for happy growth and observation.

From the cheapest and easiest arrangement of a clean, safe place to play to the most elaborate and advanced for unconscious education, every block in the city, according to its rents, could offer suitable accommodation to this large proportion of its tenants. While the whole block may be beyond our reach at present, even a small apartment house could begin the good work—even a private house if the owner could afford it. But private interest and private means are no more to be trusted to make suitable homes for children than they are to make suitable schools.

Take an ordinary apartment house of the more reasonable sort—five stories high—ten families—with an average of thirty children. Even on that limited roof space a big sun parlor for babies and sand garden for toddlers could be placed, and the other half fitted as a playroom and gymnasium for the older ones.

Below would be, as now, the family home, to which the child would return from his own playground, as he now returns from the school or the street. Having a place of his own, with acknowledged rights and privileges, he would easily learn to respect those of others—a somewhat difficult lesson now to a healthy, vigorous child, who grows up, on sufferance, in an adult home, and on the street.

In the matter of expense there is no serious obstacle.

The rich could save enough off their armies of futile nursemaids to pay for first-class care in the roof playgrounds. The poor would have less elaborate provision, and could save what was needed on doctors' and undertakers' bills and the taxes which support our prisons and asylums.

The question of association among the children will not trouble the poor, who now flock thickly in the street, and need not trouble the rich, who can keep their little ones in solitary confinement in individual pens on their roofs if they prefer; or even, as now, give each a servant, to sit gossiping with the others and drag the child about. It would be in a safe place, that is all. Neither is there any question of separating the children from their mothers. The mother may, if she will, sleep by the child all night, and sit, stand or walk by it all day (as she does now!)—it is simply that she would have a proper place to do it in. As a matter of fact, very few mothers are incessantly with their children. The poor have too much work and the rich too much play. Also these last are ashamed to be much seen with their children in the street lest they be taken for nursemaids. I remember once, when I was wheeling my own baby, being stopped by a benevolent old lady, who admired the child and asked, "Whose baby is it?"

It never occurred to her that the mother could really be with the child.

This building provision need not exclude the most devoted mother, not for an instant; it merely provides permanently for the needs of our young residents.

One more thing may affright us: "Where shall we dry our clothes?" Possibly the home is meant to be a place for children as much as a laundry. When we do make it a place for children we may be forced to take dirty work outside. So let us look forward to the advertisements of the farseeing landlord: "Elegant residence for families with children. Best roof acommodations in city. Absolutely no smoke. Double railings. Outer and inner promenade. Ample provision for swimming. Gymnasia from one year up." And so on and so on.

The market waits. Two million children in New York—permanent residents—will no one build houses for them? "Wanted: A home. Apply to The Child."

Woodstock, N. Y.

The Confessions of an Ambitious Career

BY A BACHELOR WIFE

[For evident reasons we cannot give the name of the author of this article; but the story told is true, barring a few minor changes to conceal identity. We had intended to conclude the series of articles on the subject, but this seemed necessary for completeness of view. The reader will understand that "Bachelor" means Baccalaureate. —EDITOR.]

WHEN my attention was first called to the article published in THE INDEPENDENT some weeks ago by a "Bachelor Maid" I became very much interested and felt at the time that I should like to answer this woman, who, I felt certain, was a splendid representative of so many college bred women of to-day. I restrained my impulses, however, knowing well how many petitions to enter into these controversies are inflicted upon poor editors. A few weeks later came the dissertation by the "Philosophical Bachelor." After reading and rereading these articles, it occurred to me that here were two people whose ideas upon certain important social questions were similar to those held by my husband and myself when we started life together almost twelve years ago. Now, what had become of these ideas?

The man who is now my husband had at that time just graduated from Yale, and was planning to continue his studies for the next few years in Europe. I was barely twenty, and had not quite finished my college course in a neighboring New England college. My plan was to drop my regular academic work, go to Boston for a year, then to Europe, and devote my attention mostly to the study of music, as my professors had declared I had a voice and somewhat exceptional musical and dramatic talent, and, I might add, I had had almost continuous instruction in music along with my regular school work since I was six years of age.

In the meantime the man who later became my husband and I did the very presumptuous thing that so many young American people are apt to do. We became engaged without first consulting our parents. In the following summer, when each of us went home, and our parents were humbly consulted, his did not object, but mine did. My father, who from my general record, from the winning of various prizes, etc., had gotten the impression that I was exceptional, had been nursing ambitious ideas that I was to have a future and a career. He insisted that this engagement would be the death blow to all my ambition, and, furthermore, both my parents declared I should not go to Europe to study the following year if the man to whom I was engaged should be there; for, let me add, we had planned to be very close together.

For a few days there was despair, but one fine evening while discussing this matter together light seemed to dawn upon the young man at my side. "The only rational thing to do," said he, "is to marry, go to Europe together and you continue with your work and I with mine, just as tho nothing had happened." The fear of facing my stern father overwhelmed me at first, but I took courage. The next afternoon I went out for a few hours, and my friend approached my father, armed with all the logic and oratory he had been able to command in the meantime. He insisted he would in no way interfere with my work or success, either now or later; he meant to establish a place for himself, he said, but he would inflict no burdens upon me; besides, he could be a protector in case of illness, etc. It was later agreed that I should be wholly independent, even to the point of defraying my own expenses. (This was one of my special weaknesses at this time, I dreaded the idea of being supported.)

In the meantime the parents of my

friend had become very fond of me, but sorely regretted that I was not slightly domestic in my tastes, for I loved dancing, riding, skating, walking, etc., and detested sewing, cooking and household cares of any kind, and openly declared I should never be a housekeeper, altho I had been instructed in these matters; while my friend most bravely announced he could employ a housekeeper at any time, and that this was not what he was looking for in a wife.

Six weeks later we were married.

In another month my husband was at one of the great German universities, which he had selected on account of several professors under whom he wished to work in his special line, while I entered one of the leading conservatories, which was in a neighboring city and a five hours' ride away.

The first year passed smoothly and quickly enough, as each was busy and everything was new. We saw each other during the inter-semester vacations, and were constantly looking forward to the long vacation, when we took a little trip together, then settled down in pleasant rooms to our first taste of real domestic life.

There were some pleasant friends, little suppers, some music and a great deal of time spent in the beautiful hills and woods, reading and talking together. For example, my husband taught me to read French during this summer by reading French books, hours at a time, and translating them almost literally while I followed his reading, looking over his shoulder.

Alas, the end of our little honeymoon came all too quickly, and when it came time for my return I found the old desire to go back to my music was not quite so strong, and "the man" was constantly wishing he had his degree, and that the coming year were over so we might go together to Paris.

The first days of my return were torture. I could not tell why; for every one was glad to see me back, my professors spoke most hopefully and promisingly for the coming year's work, and my old German frau received me with open arms. There came a whisper, however, "What is all this compared with life alongside of this splendid man?"

The first letters from "the man" were dark enough, but each of us soon fell into line again, and worked harder than ever.

During the first semester I managed to become a little ill, so the director recommended a few days' change with my friends, but the change did not effect a much more satisfied state of mind on my return. I found "the man" restless, working by fits and starts, sometimes not for days, and again almost all night long, and while he made no direct complaints it seemed to me his attitude toward things was changed and his earlier hopefulness was tinged with gloom. I thought I comforted him by promising to be back for a long vacation at Christmas, which was only six weeks off, but in spite of what seemed most rational philosophizing with myself, I began to feel something was just a little wrong.

The Christmas time came, and after a delightful ten days in one of the great German cities we returned again to "the man's" cozy quarters for a few days. When the day for my departure arrived I was not ready to go, and "the man" was not ready to have me go. It was a gloomy day, and "the man's" state of mind seemed well to match the day. I made a bold front at being cheery, but as we approached the station "the man" suddenly lost his voice, and no amount of chattering I could do could make him find it. He helped me carefully into a coach, and then stood as if petrified. I called to him as the train pulled out, but he made no response. I saw him put his hands to his face, and shake as if he had had a chill—I knew this great, strong man, oblivious to all his surroundings, was weeping.

I went back feeling like a criminal, and that last glimpse of "the man" stayed with me a long time.

I found on my return I had received several flattering promotions; my professors began to take greater interest in my work, and spoke very encouragingly of my possibilities, etc.; and a few weeks later I was selected one of four of the best singers in the conservatory to appear as soloist in a great musical festival they were preparing to celebrate upon the occasion of a visit in the early spring from one of the great ruling princes.

My work seemed heavier than ever now, and "the man" seemed to find new

energy preparing to take his doctor's degree. It was a long time until the end of June, however, but when it did come we left all clouds behind us and started on a long trip through parts of Austria, Switzerland and Northern Italy, and arrived in Paris about September 1st, ready to settle down to work.

We had letters to some very amiable people, who helped us get established in real Bohemian fashion; and in a month we were as settled and regular at our work as if we had been living there always. "The man" was at work in the universities, and I with two different teachers, one of whom was among the best known of Europe. We were also fortunate in finding a poverty-stricken young count, who came five times a week to instruct us in French, and who was glad to stay as long as I would roll cigarets for him to smoke, for the magnificent sum of one franc per lesson.

It is needless to say that with a small circle of very attractive acquaintances, plenty of interesting work and the diversions of Paris, the winter passed all too quickly.

In May "the man" received an offer of a position in one of the universities of the extreme West. It was a good opening for a young and inexperienced man, but the authorities insisted upon meeting him before an appointment was finally made. I had agreed to stay with my teachers until July, so could not leave. There were other American friends who had joined us in the meantime, so I was not left alone.

I arrived in New York late in July, and, as my friends had been active in securing engagements for me, I sang in various parts of the Eastern States during the summer and early fall. I became very much exhilarated with public life. The press had everywhere been favorable; in fact, the list of laudatory adjectives had been exhausted in my praise. My friends, of course, had been largely responsible for this. I arranged with two other artists of some reputation and influence to make a tour, giving perhaps a dozen concerts in the late fall, then started with "the man" to stay with him a month in his new abiding place.

All this seemed simple enough.

The university to which we went was located in a small town. We soon found a comfortable suite of rooms, but wandered from one boarding house to another, only to find that the food and constant companionship of students were to us unendurable. There were very interesting people in the faculty, but no music and little taste for it. The idea of being away most of the time and leaving my husband alone to the mercies of the boarding house did not strike our new acquaintances favorably, we soon saw, and I must say it appalled me.

The time soon came for me to go, and altho I was glad to get back to the excitement of public life, the old glimpse of the man I had left once before at the German station recurred to me and I felt a twinge of compunction. I found my artist friend, who was a thorough "man of the world," had arranged everything very skillfully.

I soon learned that a more important thing than singing well was to cajole the newspaper people in every possible way. I found our artist friend was writing or dictating our press notices and was not above bribing our critics when necessary. I had heard of this sort of thing before, but the actual experience was more or less nauseating, and when I protested I was informed that these methods were absolutely necessary for success. For example, my friend explained the success of a woman whom I had admired very much, who had returned from Europe just a few years earlier and had had an almost general triumph throughout the country, was due to her husband, who made it his chief interest to look after the press in this way. The bottom seemed suddenly to have fallen out of my ambition.

I went back to "the man," to find him more sobered than ever, envying his friend, who had a simple wife and lovely children, and I soon discovered that his existance had been dreary enough and that he could not be happy without me, in spite of his interesting work, in this little town.

With the exception of a few short trips not very far away I stayed with him until the following spring, but we were really not happy. There was the unsettled condition of our affairs and this most unsatisfactory existence. Each

felt that his greatest interest and happiness was in the companionship of the other, and that the work of one must be somewhat sacrificed. Little was said, but each felt the mental and spiritual fermentation of the other.

In the spring there were new experiences to relieve me of still more of my ambitious ballast.

A friend, venerable in the profession and a master of his art, had lost an excellent place as director because he refused to be levied upon longer by one of our leading critics, whose name still appears in every musical journal in the country. Next, on being introduced to one of the musical dictators of one of our great cities, and having sung for him, among various serious things, one gay little song, he declared with great enthusiasm that my field was in variety show; he felt certain I could command one hundred dollars per week, need not mix with the ordinary run of vaudeville people and could really be more independent than in any other line of work; greater artists had gone into this line of work and why should not I? I felt as if I were being urged to participate in a great mental and spiritual debauch.

The following summer a friend and his family went away on a vacation and offered to us the use of their beautiful country residence along with the maid and man servant. Just why I do not know, but I was willing to cajole that cook more than any press man I had ever met; in fact, I know no mistress had ever gotten as much work out of her. The truth is, after all these years of boarding and rooms, we found untold happiness—a sort of intoxication—in a house by ourselves. I never got tired of trying to make good and pretty new dishes to eat, and we invited everybody in of whom we could think, simply to furnish an excuse for preparing a feast. The grocer's bills were at first appalling, but I soon took pleasure in my mother's old doctrine of seeing how much I could do on little capital.

"The man" became himself again, and we rarely spoke of the future more than that we each wanted above everything else to establish a home of our own.

Our parents were consulted, for we had not troubled to save much of our own earnings, and they seemed glad to furnish the wherewithal.

We selected a beautiful spot on a bluff just out of the town, and by the following November we were established with a bright little maid and keeping house like real old-fashioned married folks.

I did not give up my concert work entirely, but the trips became less frequent and my efforts to secure engagements were very much less active.

There was now a new problem. We both loved children and I had always felt this was one duty I should not shirk. Of course, there was that awful shrinking, which our "Bachelor Maid" has truthfully described as the experience of every thoughtful woman, but I had always been certain that my talents were not great enough to exempt me from this duty. Besides, even in my most ambitious days, it had not occurred to me that the rearing of children would permanently interfere with my work. Had not the greatest women in literature, art and history been married and mothers, and why should not I?

In thirteen months there came a little daughter, of course the prettiest I had ever seen. My one overwhelming desire was to nurse this delicate little creature and make her thrive; but as soon as my excellent nurse had left me she began to grow puny and I felt my absolute ignorance and helplessness to give her intelligent care. I went over all the long years of teaching and instruction I had had and could recall not one idea I had received which could give me light. In my despair, as the child grew more feeble, I could not help feeling something was dreadfully wrong with my education. In the meantime my nurse sent me some of the best works on the care, nursing and feeding of children, and I raised my first baby, as my brother has always insisted, "on schedule time."

After three months of the regular habits I had given her I found her a great delight and very little care, and thriving much better than when I had ignorantly worked with her the greater part of each day.

A few years later there came to my husband a call to an Eastern university; a little later there came to us also a son.

In the meantime we have been back to Europe for six months and have visited some of the old haunts.

I give some of my time to teaching, assist my husband with some of his writing, have published several articles myself, also some kindergarten songs I had written for my children. My first interest, however, is always in my home and family, but in spite of this I have never ceased to be a student. Of all my experiences there have been none so helpful and happy as the rearing of my children; helpful because they have taught me patience and gentleness, which I never knew, and happy because they have opened up a well of love which only a mother can understand.

Reminiscences of Edgar Allan Poe

BY SUSAN ARCHER WEISS

[To the letter from Mrs. Weiss to Professor Harrison, published some time ago, giving her memories of Edgar Allan Poe, she added a longer postscript, suggested by reading Professor Harrison's biography. We give it herewith.—EDITOR.]

HAVE you an account of Poe's two public recitations in Richmond of "The Raven" and the "Poetic Principle?"

(I may here mention what was known to all Poe's intimate friends, and from his own lips—that his engagement to Mrs. Shelton was positively broken off before he left Richmond.)

Now let me make some miscellaneous comments on your biography, the MS. of which you kindly submit:

It must be admitted that Edgar Poe did repeatedly, as occasion suited him, misstate his own age, as on *page 2d.*

It is doubtful whether Mr. Poe did actually ever "look forward to the inheritance of a large fortune" (p. 1), for he was not by any means the only one whom Mr. Allan considered in the disposition of his property, and he must have known what Mr. Allan frequently declared to be his intention, to provide liberally for Edgar in establishing him in some business which would afford him ample self-support. It was generally understood in social circles that the greater part of his fortune, in event of his wife's death, would be settled upon her sister, Miss Anne Valentine. She had been his first love, whom he addressed before he did her sister (this she told me as a secret)—he being at that time a poor man, rather rough and uncultured in mind and manner. It was said that, after his wife's death, he (in case of his own death unmarried) settled his handsome home on her as a home, or intended so to do; and certain it is that she continued to reside there with his widow until her own death. She was homely in person, but of a lovely disposition, and being, like Mrs. Allan herself, tactful and diplomatic, the two ladies agreed excellently well together. It was only in my mother's house and in confidential conversation with her and one of her own relatives, my Aunt Valentine, that I ever knew of Miss Anne's taking Edgar Poe's part against Mrs. Allan, she maintaining that the former had been "more sinned against than sinning." It was said that she often, after his rupture with the Allans, secretly supplied him with money.

Page 5. My mother remembered perfectly Mrs. Poe's appearance on the stage in Norfolk, she having been taken to "the play" as a treat. She looked, according to my mother, more like a girl of sixteen than a woman of thirty, which was said to be her real age, she being some years older than her husband. She was *petite* and very graceful, with a round, childish face, short dark curls and beautiful large laughing eyes. She was considered rather childish and silly, and not a talented actress, tho her beauty, piquancy and coquettish ways made her a great favorite on the stage. My mother said that her son resembled her *in feature.*

P. 23. Rosalie—not Rose—was the baptismal name of Poe's sister.

P. 27. I do not think that Edgar was "spoiled" by Mr. Allan. The latter was, from all accounts, an impulsive, quick-tempered man, and, as I have heard stated, very strict with the child, permitting no act of disrespect or disobedience to pass unpunished, unless at his wife's entreaties. I remember hearing of an instance of this. My uncle Valentine, who was as fond of fun as Edgar himself, taught the latter many mischievous little tricks, among which was that of pulling away a chair from a person about to sit down. Edgar was too little (about four or five) to discriminate as to the proper subjects for this joke (which had been positively forbidden by Mr. Allan) and one evening at a "tea-party," seeing a certain rather corpulent and dignified lady about to seat herself, suddenly snatched away her chair, he himself falling on the floor in an exuberance of delight. Mr. Allan's action was prompt, and when, after a brief absence with Edgar, he returned to the company, his wife took an opportunity of slipping away in order to comfort her pet.*

In regard to the engagement with Mrs. Shelton, it was broken by Mr. Poe himself in consequence, as we understood, of her refusing him a loan for the establishment of *The Iris* [*Stylus*], in the success of which she had no faith, and accusing him of wishing to marry her for her money. Poe himself, greatly disgusted, broke the engagement, and ceased his visits to her. He went for a stay of some days at the country home [Duncan's Lodge, on Broad Street, opposite the Lee Monument] of his friend, Mr. John Mackenzie, and I well remember that during his absence Mrs. Shelton one day came to see Mrs. Mackenzie, with whom she had no previous acquaintance, and had a private talk with her in the parlor, as was whispered in the family, about Mr. Poe's letters to her. I do not know what letters these were which she was so anxious to obtain and which he refused to give up unless she returned his own. There was certainly a bitter estrangement for a time, nor was there ever to us any evidence of a reconciliation —tho a letter from Poe and one from Mrs. Shelton to Mrs. Clemm, now in evidence, would indicate that the engagement was renewed, and Mrs. Shelton, on Poe's death, donned "widow's weeds" of the deepest mourning. He himself always denied, even in public, that any engagement existed between himself and Mrs. Shelton, and spoke of the schoolboy love affair with her as a case of "measles." Observe also Mrs. S.'s own statement on *page 315* that she "was not engaged to him, but there was a partial understanding." With these contradictions the case is one difficult to be understood.

I did not know Mrs. Shelton, but saw her on two occasions—once, when she called at Mrs. Mackenzie's, and again at Poe's lecture at the Exchange Hotel. She was a tall, rather masculine looking woman, with good features, hollow cheeks, thin lips and large blue eyes with purplish shadows about them, which had once probably been handsome. She was richly dressed, but had not a particle of grace or *style,* and her countenance was wholly expressionless. She impressed me as being hard and cold—the type of a thoroughly respectable, sensible, matter-of-fact woman, with whom no one could associate an idea of romance or poetry. I heard her spoken of as "a rich widow," but she lived in a plain manner, in an ordinary, substantial brick house with a high square porch and not even a flower to ornament the front yard. Miss Van Lew once pointed out this house to me, a few doors above her own, saying, "I used to see Mr. Poe go in there when he first came to Richmond, but not during the last part of his stay here. Once or twice they walked out together, and we could not but notice the contrast between them even in size."

This house [now No. 2613 E. Grace Street, near, not opposite, St. John's] was opposite St. John's* Churchyard, where Poe's mother was buried.

Poe's last visit in Richmond was to Mrs. Shelton on the evening before his departure for Baltimore. In returning

* Our knowledge of the now well-known fact that Poe enlisted in the United States army is due not to Mr. Gill or Professor Woodberry, but to Mrs. Weiss, whose uncle, Dr. Archer, was post surgeon at Old Point at the time and often saw Poe in his uniform as a private there. Following out Mrs. Weiss's suggestion, Professor Woodberry then went to work and established the fact by documentary evidence obtained from the War Department. Honor to whom honor is due.—J. A. H.

* The church celebrated in Virginia annals as the place where Patrick Henry pronounced the famous "Give me liberty or give me death" speech. —J. A. H.

from her house he stopped, as was his custom, to rest at the office of Dr. John F. Carter, and then, instead of going on to the Swan Tavern, crossed over to Sadler's restaurant, whence he repaired at a late hour to the Baltimore boat, which was to leave at four o'clock. It was said that he was sober, but it is now certain, on the authority of Dr. Carter, that he did not send for his baggage at the Swan, and this explains a point which has been much commented upon by his biographers, who assert that his baggage was stolen from him in Baltimore. It was, after his death, forwarded to Mrs. Clemm in New York by Mr. John Mackenzie.

Speaking of Mrs. Shelton, Rose Poe—who was altogether without tact or judgment, wishing "to see her brother and Mrs. Shelton together," as she said—one day went to that lady's house when she knew that her brother was there. She was shown into the parlor, where she found him lying on a sofa with a headache from his long walk. Mrs. Shelton called her into the hall and said, "He does not need you here, and I will take care of him myself,"—and so dismissed her, to her great indignation.

Shall I confess that I have little faith in the sincerity of Poe's love rhapsodies, especially as regards Mrs. Whitman? His letter to her (how *could* she ever have made it public?) is clearly no genuine love-inspired epistle, but an elaborate work of art intended to please the lady. A poetic college youth might have written such to a romantic girl in her teens, but between a man and a woman of nearly fifty such a passion as is here portrayed—such ideal visions of love in a cottage, etc.—appear rather exaggerated. A gentleman who knew both Poe and Mrs. W. told me that her portrait had been greatly overdrawn and that he did not credit her account of Poe's insane conduct at her house; that he could not imagine Poe acting as described, and he also doubted whether the lines, "I saw thee once, once only," were addressed to her. But it is impossible to know to whom Poe's poems were originally addressed, except in the case of Mrs. Osgood, who appears to have been a genuinely sweet, feminine and lovable woman. It is strange, and to me incomprehensible, how freely all these women, down to Mrs. Shelton, have informed the public of their love passages with the poet.

Mrs. Shelton had no children. Some of her family, the Roysters, are still living—in Hanover, I believe. They and the Sheltons were plain, respectable people—her husband, if I am not mistaken, a prosperous grocer on Church Hill.—I believe that Mrs. Shelton was really anxious for the marriage with Poe. Mrs. Osgood accuses Mrs. Whitman and others of seeking Poe's acquaintance and attention, or, to use a common expression, "running after him," and this may be as well applied to Mrs. Shelton. After his wife's death she was continually inquiring about him of Mr. Thos. Mackenzie, and even sent messages—remembrances and regards—and hoped he would visit Richmond. Possibly letters may have passed between them (the letters which she was afterward so anxious to regain possession of?). Mrs. Clemm, I heard, who had not favored Mrs. Whitman, was anxious for the match with Mrs. Shelton, whom she had known in Richmond, and with whom she anticipated a quiet and comfortable home. But when, after Poe's death, his poverty-stricken mother applied to Mrs. Shelton for a slight pecuniary aid, she received no response. Two weeks after Poe's death Mrs. Shelton made her appearance at church and on the street clad in deepest widow's weeds, which she wore for the prescribed conventional period. It is true that she used to be sarcastically pointed out as "Poe's Lenore." She was very "close" with her money, but appears to have been a good woman—pious, and on good terms with her relatives and acquaintances, and much esteemed by them.

About Poe's last lecture in Richmond—it took place, not, like the former one, at the Exchange Hotel, but at the "Odd Fellows' Hall," just below, on Franklin Street (afterward police court). With my mother and sister and Rose Poe, I attended, and, arriving late, found about sixty persons, mostly of Richmond's representative society, assembled—the Cabells, Carringtons, Miles Careys, Daniels, Ellises, etc.—an appreciative audience. Mrs. Shelton was pointed out to me occupying, with a male friend, a conspicuous front seat exactly opposite the platform. This was, I think, during the

period of their estrangement. Mr. Poe, clad, as usual, in black, stepped upon the platform, and, gracefully bowing, commenced his lecture ("*The Poetic Principle*"), his hands resting upon either a railing or a low writing desk in front of him. During the whole lecture he never changed his position or made a gesture even with his hands, but his *expression* was constantly changing, and it was almost impossible to remove one's eyes from his face. The audience seemed fascinated and listened breathlessly and almost as motionless as the speaker. Upon concluding he again bowed, and then, without a pause, came quickly down the steps to where we were seated, in doing so passing Mrs. Shelton without notice. He looked unusually pleased, and handsomer than I had ever seen him. People observed him curiously and some waited, evidently desiring to speak to him, but he appeared oblivious of their presence, not once glancing toward them. His face, with the beautiful, soft smiling expression of his eyes, I can this moment in memory behold as plainly as I then did. Rose, who was very proud of her brother, and also of herself as "the poet's sister," was almost absurdly happy, and remarked: "Edgar, just see how those people are staring at us—the poet and his sister."

I can recall him in various situations —once, strolling meditatively and alone in the old Hermitage road at twilight, and, again, holding a skein of yarn for Mrs. Mackenzie to wind. It was on a Friday that I was introduced to him, and on the following Sunday at church I was surprised to see him enter and very quietly take a seat just across the aisle opposite us. He sat motionless and attentive during the service, only once or twice turning his head and glancing up at the choir during the fine singing. I observed that his appearance attracted attention, tho he was not recognized as the poet about whom everybody was then talking. He walked with us up Franklin Street to my uncle's, Dr. Archer's, but would not accept his invitation to enter. My uncle remarked, as he left, that he still looked much like the Poe whom he had when post-surgeon at Old Point often seen there in the uniform of a private.

On the day following this my mother, sister and myself were going down Main Street, when we passed Mr. Poe and Dr. Gibbon Carter with several other gentlemen at the entrance of the American Hotel. We stopped at a jeweler's, when presently they appeared and stood just outside, while my sister and myself in the doorway talked to them. Mr. Poe stood bareheaded, with his hat and cane held behind him, the *beau ideal* of a courteous, elegant and high-bred gentleman,—as, indeed, he appeared to me on all occasions. These brief glimpses may serve to give some idea of his general manners and appearance.

I have often wondered whether the renewal of the engagement with Mrs. Shelton (if there *was* a renewal) was the result of that lady's offering to assist Mr. Poe, pecuniarily, in establishing the *Stylus*. In my last interview with him he appeared so cheerful and confident of its success.

I do not know what became of the review of my poems which Mr. Poe in my last interview with him told me that he was writing—probably it was only a beginning, and as such valueless after his death—and so I missed being immortalized.

I once on a quiet, drizzling summer day had an hour's talk with Mr. Poe in our own parlor about "The Raven," when he said: "Do you know that 'The Raven' was originally not a Raven at all, but an Owl?" I hardly noticed then what if I had been older would have so much interested me. I only asked why he had made the change. To which he replied, "For sake of the '*nevermore.*'" I afterward mentioned the circumstance to Dr. Holland (editor of *Scribner's*), who said that he had heard something of the same kind, but did not credit it. For this reason I refrained from mentioning it in my "Last Days" of Poe. But in reading the poem one comes upon words and expressions which irresistibly remind us of the Owl, the bird of wisdom—Minerva's bird, which "perched upon *the bust of Pallas*"—more appropriate to an Owl than a Raven—

> "Then this ebony bird beguiling my sad fancy into *smiling*,
> By *the grave and stern decorum of the countenance it wore*," etc., etc.

Moreover, owls are night-birds and,

as is well known, are attracted to lighted windows at night, which doesn't apply to ravens.

"And *its eyes have all the seeming of a demon that is dreaming*"

is decidedly owlish. But I would not venture at this late day and with no proof to put forth this claim of Owl *versus* Raven.

In an article of mine published some 15 or 20 years ago, on "*The Sister of Edgar A. Poe,*" I gave the following account of the Poe children, the first glimpse which we have of Edgar, and on the authority of my own mother. I have no copy of the magazine in which it was published (*The Manhattan* or *Cosmopolitan*), and must, therefore, quote from memory.

In November, 1811, my mother, a child of ten years (sister of the late Dr. Robert Archer, of Richmond), was liv- in Norfolk, and a daily visitor at the house of her aunt, Mrs. Butt, on Bermuda Street. In the attic of the adjoining house were lodged Mr. and Mrs. Poe, two small children, and a nurse—the latter an old Welsh woman (she may have been Scotch) called Mrs. Tubbs or Tibbs, who spoke imperfect English in a way which amused my mother. Mr. Poe was sick in bed, and the nurse kept the two children mostly out of doors, the weather, tho in winter, being mild and sunny. The eldest, a beautiful boy, was very gay and restless and not easily controlled, while the girl was quiet and generally sat on the nurse's lap. Both were apparently wayward, spoiled children. My mother recalled how one day the boy persisted in running to and fro across the narrow street, and came near being killed by a runaway horse, when the nurse dropped the little girl and rushed toward him, crying, "Ho! Hedgar! Hedgar!" People would often stop to admire the children, and my mother repeatedly heard the nurse say in answer to an inquiry, "Rosie is two years (and certain months) old, and Hedgar is just four." *Note that this was in November of* 1811.

To obtain additional evidence on this point, I some years since wrote to my old friend, Mrs. Byrd, a daughter of Mrs. Mackenzie, and with whom Rose Poe had been brought up, knowing that at the time of the children's baptism or "adoption" their ages had been registered. The following is her answer, here copied *verbatim*, from the original note now in my possession:

You ask the date of Edgar's and Rose's birth. From a remark of his [in a letter in answer to her wedding invitation: S. A. W.], he said that if I had put off my marriage one week it would have been on his birthday. I was married the 5th of October. He was born in the year 1808, Rose in 1810. Their mother died 8 Dec. 1811, & on the 9th the children were taken to Mr. Allan's & our house. Their mother was boarding at Mrs. Fip's, (a milliner) in Richmond, & was buried at the Old Church [St. John's] on the hill. Mr. Poe died first, in Norfolk, I think.

It is certain that Mr. Poe died in Norfolk; where the company with which they were playing (Mr. Placide's) were compelled to leave him on account of his illness, while they went on to Richmond. On hearing of his death one of them returned to Norfolk and brought the whole family to Richmond, intending to take them to their friends in Baltimore, but Mrs. Poe being taken with pneumonia, died as above. Mrs. Mary Carter (daughter of Major James Gibbon and mother of the late Mrs. Minnegerode), who was always very severe in her condemnation of Edgar Poe's Baltimore relatives in connection with their treatment of the children, asserted that Mr. Placide took pains to inform them of the pitiable condition of the family; he himself being very generous in providing for them; but it does not appear that they made any response until after Mr. Allan and Mr. Mackenzie had at their own expense had Mrs. Poe buried in St. John's churchyard. The grave is now unknown, tho "close to the Eastern wall," as I have been told.*

On the whole, the old nurse's account would appear to be the most authentic and reliable, she being in a position to know certainly what she stated, while the other testimony was only from hearsay. Also her account would agree with Poe's own statement to Mrs. Byrd that the 12th of October was his birthday.

"Grandmother Arnold" was this old Welsh or Scotch nurse, Mrs. Tubbs—or Tibbs, as she was known in Richmond. In her last illness Mrs. Poe called her "Mother," while she always addressed

* Of course, this contradicts all the traditional accounts of Poe's birth day and year, the records of the University of Virginia, etc. Poe himself gave many varying accounts of his age, substituted his sister's age for his own, etc. What are we to believe?—J. A. H.

the latter as "Betty." It was said by some that the name of *Arnold* was an assumed stage name—evidently preferable to Tubbs.

The company with which the Poes were playing was Mr. Placide's, not Mr. Green's, the latter and his wife being leading members of the company.

Mr. Gill asserts that the father died three years later [than his wife] of the same disease. Mr. Gill is all wrong.* Mrs. Poe's lodgings were plain but respectable, in the house of a milliner, in the damp, low-lying portion of Main Street, just above the Old Market, known as "Bird in the Hand." There could have been no such wretched surroundings as described by Gill. The pawning or selling of her clothes is due to Mr. Gill's very fertile fancy.

Neither Edgar nor Rosalie was in the legal sense "adopted" by Mr. Allan or the Mackenzies; they were simply "taken in," as any charitably disposed person might arrange to protect two destitute orphan children.

The "fashionable school" spoken of was not "kept by the Mackenzies," but by Miss Jean Mackenzie, sister of the gentleman who "adopted" Rosalie.

[Thus far Mrs. Weiss still further expresses her emphatic dissent from the statements made (page 112) in the letter from Mr. Allan's niece accusing Poe of forgery and of brutal conduct during Mr. Allan's last illness. She adds:] The account which I have heard of this occurrence is (with some slight variation) simply this—that Poe, having been informed that Mr. Allan had expressed some kind feeling toward him, went to the house and requested to see him—and that this being refused, he stepped into the hall and insisted upon the message being delivered to Mr. Allan himself; whereupon Mrs. Allan ordered the servant to "put that drunken man out of the house." This was all.

I, of course, do not intend in the least to disparage your correspondent, who has simply told what she had heard and believed, but I consider that I have the best and most reliable authority, in a word, of such well-known ladies as Mrs. Carter, Mrs. Mackenzie, Mrs. Peter Chevalie, Mrs. Julia Mayo Cabell and others of equally high standing. The occurrence was well known and much discussed in society.

* There is indubitable evidence, in an unpublished letter, written by Poe himself, giving the history and genealogy of his family, that his father died several weeks *after* his mother. Mrs. Weiss corrects the statement (p. 8) that "little Rosalie came after her father's death, to add to the distresses and troubles of the mother," holding that she was at least two years old at this time.—J. A. H.

The Sword of My Defense

BY NORA ELIZABETH BARNHART

I have a friend who is so much my friend
  That in his hand I dare, yes, dare to lay
  The sword of my defense, nor do I say
One word of caution. Tho the edge could rend
My very soul with one sharp thrust, could end
  My braveries, my hopes, my dreams, could slay
  The faith of hopeless years, still day by day
I watch him wear it, since he is my friend!

Yet now and then, because he is so glad
  And gay and happy, he must try and see
  If he has really power over me,
And needs must try the point! Would he be sad,
  I wonder, if my cloak should fall apart
  And show a thousand stains above my heart?

GRAND RAPIDS, MICH.

Literature

Christian Faith in an Age of Science

It is a pleasure to find a book so strongly marked by good sense and good temper as this,* for both these qualities are unfortunately rare in the warfare on the border of science and theology. Indeed, the use of the word warfare is out of keeping in a discussion of the book, for the development of theological and scientific thought, which to Draper and White was a fierce and bloody battle in which the ecclesiastical forces were always wrong and always defeated, appears as seen through the eyes of Professor Rice an orderly progress of well meaning tho fallible human beings toward the same central truth. Professor Rice's book is neither so scholarly nor so impassioned as President White's "Warfare of Science and Theology," but on both accounts it is likely to be useful to a greater number. It is not an epoch-making book, but a book made to fit an epoch and to bring belated minds into harmony with it. Its presentation of conflicting views is so fair, clear and unprejudiced that the general reader will find it very valuable as a survey of this field of modern thought.

Whether the book is to be regarded as radical or conservative depends on one's own standpoint. It is certainly constructive rather than destructive in its tendencies. Professor Rice is not an extremist; he is something of an opportunist, but he does not attain a specious harmony of opposing authorities by the familiar method of forcing each a little from his position. His method consists rather in cutting down the extravagant claims and assumptions of both parties, then modestly and without dogmatism stating his own opinion or reason for suspension of judgment. To traverse a field so full of pitfalls and flying missiles without dodging or shutting his eyes as he has done is in itself a noteworthy feat.

Part of the book is taken up with the exposition of modern scientific theories, such as evolution, the antiquity of man and the laws of the conservation of energy and matter, in the elucidation of which there is given a large amount of general information on biology and geology, not relevant to the argument, but undoubtedly much needed by the readers to whom the work is primarily addressed. After a presentation of the results of the critical study of the Bible, such problems as the argument from design, providence, prayer, the personality of God and miracles are considered in their relation to modern thought.

It has been long a favorite remark of contemptuous ecclesiastics that there is no need to consider the difficulties raised by science until all scientists were agreed on all points. Professor Rice wittily turns this weapon against those who have used it by saying in regard to the two first chapters of Genesis:

> "Evidently the first task for the interpreter who regards these two narratives as scientifically accurate history of the process of creation is to reconcile them with each other. Until that can be done, it is superfluous to inquire whether both or either of them can be reconciled with the teachings of science in regard to the history of man and his dwelling place."

He distinguishes, even in the Gospels, between the miracles of different evidential and theological value. The virgin birth, he says, is not so well authenticated historically nor so important to Christian thought as the resurrection. Like most theologians who have been affected by modern science, he has a profound belief in the immanence of God.

> "Providence is not an exceptional interference with the course of nature. The course of nature is itself providence."

Pro-vidence, he says, is from its very etymology foreseeing, and consequent foreordaining. From this we question whether Arminius would recognize him as a follower, but nevertheless his line of thought brings him into closer touch with some of the noblest passages of the Bible, such as Isaiah 45:7:

* CHRISTIAN FAITH IN AN AGE OF SCIENCE. *By Prof. William North Rice, of Wesleyan University.* New York: A. C. Armstrong & Son. $1.50.

"I form the light, and create darkness: I make peace and create evil; I the Lord do all these things."

Business Education

THE past twenty-five or thirty years have seen rapid and radical changes in the notions of education along practical or more practical lines. First came business schools and technical schools. These shortly assumed to be colleges, much to the digust of educators of the old school. This disgust gradually wore away, and the teachers in these schools and colleges carried the title of "professor," first under sufferance, then without general criticism. It is worthy of note that the Young Men's Christian Association was among the first to detect the necessity for systematic preliminary training for practical business life, and establish classes to meet the need; and now several of the more progressive universities have established schools of commerce and accounts, and these schools are ranked with the old professional schools and lead to degrees of equal or almost equal honor. The Western colleges have been more alert than the Eastern in this matter, and to one unacquainted with the situation the activity along these lines in England and France and elsewhere on the Continent will be a surprise. It is also noteworthy that Barnard and Radcliffe colleges give attention to it.

This change has come about through the expansion of American industry and commerce and the sharpness of competition and the resulting consolidation of business and commercial interest. These conditions have led also to the publication of many books in one way or another connected directly with business.

Mr. Haskins was the Dean of the New York University School of Commerce, Accounts and Finance, and as such had special reason to be in pace with the movement for education along commercial lines. The history of accountancy, running back to Greece and Rome, and even to Babylon and Egypt, and including the methods of the early Mexicans and the Chinese and Indians, is a very interesting, tho perhaps not a practical, chapter of Mr. Haskins's book,* which is concluded by his account of his own battle with the chaotic municipal accounts at Chicago, which he brought somewhat nearer to honest business standards, and in which he introduced a system of checks and counterchecks, such as practical business requires and practical politics does not.

The scope of Mr. Hatfield's book † is much wider and more detailed, as it consists of lectures delivered before the University of Chicago by men specially equipped to deal with their special subjects. Railways, trade and industry, banking and insurance are the general subjects dealt with in fifteen lectures. These are introduced by Professor Laughlin's lecture on "Higher Commercial Education."

Franklin H. Head and H. F. J. Porter discuss the steel industry. Comptroller Eccles deals with the currency and banking. Advertising, that noisy and extravagant science, is set forth by the president of an advertising company. Mr. Kimball, a prominent credit man, sets forth the difficulties and importance of the credit department in modern business. The management of railways, probably the most important feature in modern commerce, is summarized by Mr. A. W. Sullivan. E. D. Kenna lectures on railway consolidation.

President Thwing holds that the college of liberal learning affords the best preparation for men who are to occupy important positions in the business world, as it does for the three "learned" professions. This conclusion is not the result of academic meditations, but is reached only after the consideration of hundreds of letters from the heads of large corporations and successful business men, which he quotes and discusses in his book on *College Training and the Business Man.*‡ The requirements of banking, transportation, insurance and general administration are specially investigated, and he finds in all these that the development of the whole man, mentally, morally, physically and socially, is of more importance than technical training, and that the college by training a man to

‡ COLLEGE TRAINING AND THE BUSINESS MAN. *By Charles F. Thwing.* New York: Appleton & Co. $1.00.

think clearly, to weigh evidence, to concentrate his attention, and to utilize all the sources of knowledge, best fits a man for whatever duties may in after life devolve upon him.

Elson's History of the United States*

THE desirable qualities of a popular history have been in part stated by Mr. Elson in the preface to his new work. He wishes to present "an accurate narrative of the origin and growth of our country and its institutions," combining "the science of historical research with the art of historical composition," and balancing "the narrative and critical features in intelligent proportion," which has no place for "worthless incident and detail." If a popular history went no further than this we should greet it with enthusiasm, but in any of the qualities prescribed this work will be found wanting.

In respect to accuracy one may find little flaws or large misconceptions. The author seems to be seeking the picturesque regardless of the fact, as (page 279) in the matter of the sword supposed to have been sent by Frederick the Great to Washington,—"From the oldest general in Europe to the greatest general on earth." A scholarly historian would have known that this myth had been completely destroyed by M. D. Conway, in volume XIX of the *Century Magazine*. As to the following statement that Frederick "could not conceal his sympathy with America," the author needed only to have consulted Doniol or Kapp, the two great authorities on the subject, to have known better. Again (page 251) a dramatic situation is secured by having King George receive the American petition and answer it by thundering a proclamation of rebellion; but the facts are that George thundered first and learned of the petition afterward. Then, with dramatic flourish (page 273), we are told that, in the account of the battle of Saratoga sent to Congress by Gates the name of Arnold was not even mentioned, and that Gates took the entire credit to himself. Gates's own letter disproves this, for he expressly commends Arnold and others. Mr. Elson's account of the way France was induced to aid the United States absorbs the errors of all other erroneous accounts. He wholly misunderstands Arthur Lee's services, the time of Franklin's influence, and the effect of the French treaty in America. He tells inaccurately the story of Robert Morris's $50,000 used to retain the patriot soldiers until Washington could use them at Princeton. So much for a few of the flaws, but the larger faults are as numerous. The treatment of the Colonial era is the antiquated one of a generation ago. The Colonies, as the frontier of the expanding British Empire, are not understood. De Soto is exploited at the expense of Coronado, Narvaez, and De Ayllon, thus cheating us of the central idea of the time—the tireless quest of gold which gradually widened the knowledge of this new world. What is said about the causes of the Revolution is in the main fair, but the author should have explained that Writs of Assistance were no new thing, and he was not warranted in putting so much stress on Otis's speech against the writs. The development of the West is as neglected as if Turner had never written his luminous articles on that phase of our history. On the whole, Mr. Elson has used good sources, but rather to establish individual facts than to get the larger ideas and points of view contained in the works of the specialists. Repeatedly he quotes specialists, whose real contributions he has not at all grasped. He has turned to them for his facts, but not for the meaning of the facts.

As to "the art of historical composition," Mr. Elson has not learned that the popular historian may be easy and graceful, but not jaunty. A trifling air takes away the flavor of truth. In seeming attempts to be natural after certain lofty flights the writer succeeds only in being weak. Again, "fine writing" takes the place of the dignified language fitting for a noble theme. Trivialities intrude where simplicity and directness would have been pleasing. Instead of grace we have ill-rounded sentences, and colloquialisms are substituted for sim-

* HISTORY OF THE UNITED STATES OF AMERICA. *By Henry William Elson.* The Macmillan Co. $1.75.

ple expressions. Some of the figures are ludicrous, as is "gigantic centipede" as a simile for Braddock's army. Finally, the author calls us to look for that sense of proportion which has no place for "worthless incident and detail." How does he explain the presence of the pointless anecdotes about Washington (page 266), about Theodosia Burr (page 406) and concerning Cass (page 562)? The four pages devoted to the whole political movement leading to the Declaration of Independence, and the five pages given to Arnold's treason, constitute but one of the many examples of inexplicable proportion.

It is evident that we have yet to look for a short popular history of the United States by a master of the subject. Still, imperfect as Mr. Elson's 900-page volume is, it is far from worthless, and until the master comes the people must get their history from Mr. Elson and President Wilson, whose five-volume work contains about the same number of words as the present single volume.

Genius in Glasses*

THE present volume is the second in which Dr. Gould has treated the subject of the ill health of literary men and women, and has succeeded in tracing to his satisfaction, at least, their symptoms to the existence of eye strain because of improper correction of optical defects. The previous volume contained the studies of the ill health of De Quincy, Carlyle, Darwin, Huxley and Browning. In his preface to this volume Dr. Gould confesses that the first volume of biographic clinics was not received either flatteringly or encouragingly by the leading medical journals of this country. If the recent expression of opinion in this matter within the last few weeks at a meeting of the New York Academy of Medicine be any index of the evolution of medical opinion in the meantime, it seems much more probable that this second volume will receive even more severe criticism than its predecessor, if, indeed, it be not ignored entirely, for there seems to be almost a concensus of opinion among medical writers that Dr. Gould is, as he quotes in his preface, "possessed by a theory or is so infatuated with the partial truth represented by his specialty" that it is useless to attempt to set him right.

It has happened often enough before, however, that the medical profession was a unit in rejecting some valuable idea in medicine when it was first proposed. While that does not seem likely to be the case in the present instance, there is no doubt that Dr. Gould has opened up a rich field for thought and discussion. Much of history, to say nothing of biography, will have to be rewritten from the standpoint of the progress in modern medicine. Many a poisoning case of the olden time was nothing more than a death in the ordinary course of nature from causes which are now well understood, but which were formerly completely ignored. The possibility that something at least of the nervous and mental symptoms accompanied so often by headache from which so many literary men and women suffered were due to eye strain seems not at all improbable. In the case of Parkman there is great probability that proper modern treatment of his eyes would have enabled the American historian to do much more work than he actually did with much less difficulty and without the torture which he had to endure.

On the other hand, it is very clear even to the casual medical reader that many passages from the lives of other men and women have been forced into expressing possible connection of their symptoms with their eyes without sufficient justification. Much is said of migraine, as if this form of headache were frequently due to eye strain, which it is not in the opinion even of our best ophthalmologists, but also as if eye treatment would have relieved this annoying symptom, which it practically never does in the experience of conservative eye and nerve specialists. Dr. Gould's book is cleverly constructed, notwithstanding this, however, and one good result it certainly will have: no literary man suffering from obscure symptoms will in the future permit his ailment to continue to hamper his

* BIOGRAPHIC CLINICS. *Volume II. The Origin of the Ill Health of George Eliot, George Henry Lewes, Wagner, Parkman, Jane Welsh Carlyle, Spencer, Whittier, Margaret Fuller Ossoli and Nietzsche. By George M. Gould, M.D.* Philadelphia: P. Blakiston's Sons & Co. $1.00.

literary work without consulting a competent specialist in eye diseases.

Nervous, high strung individuals often suffer from ocular defects, and yet even the most careful treatment of the eyes will not relieve symptoms that appear surely to be the reflex effect of faulty optical conditions. The fact seems to be that the ocular defects are themselves often a manifestation of that excitability of nervous system which makes the individual responsive and emotionally expressive, and which is, indeed, perhaps the physical basis of their difference from more commonplace persons.

Rulers of Kings. By Gertrude Atherton. New York: Harper & Brothers. $1.50.

The effect this book is likely to have upon the average intellect was tersely expressed the other day by a young woman who chanced to take it up. After a vain attempt to read it she put it down, remarking wearily, "How some of our modern authors do sling words around!" This may be trivial criticism, but really with a book like *Rulers of Kings* serious criticism is out of the question. Briefly, the story, disentangled from the grandiloquent phrases in which it is framed, concerns a superhuman person, Fessenden Abbott by name, who is the son of a fabulously rich American, but who has been brought up in ignorance of his inheritance. When finally the truth is gently broken to him that he is to be a multimillionaire he experiences

"the profoundest discouragement he was ever to know, except on that midnight ten years later when he stood in a moonlit balcony in Hungary, alone with the daughter of an Emperor, and opened his contemptuous American mind to the deeper problems of Europe."

Fessenden does not, however, allow the little accident of great riches to dim his remarkable personality, or to interfere with his Titanic ambitions. Kings, Presidents, statesman are his footballs, and before he is thirty he has completely changed the map of South America, has the United States pretty well in his grasp and has turned his attention to Europe. At intervals he dips into scientific experiments, and invents an electrical kite which can be sent to any distance, and which can be made to rain down dynamite in quantities sufficient to annihilate an entire army. It is this little argument which Fessenden uses to induce the Emperor of Austria to consent to his, Fessenden's, marriage to the Archduchess Ranata. Fessenden and William of Germany are close friends, tho the intimacy is at times interrupted by the tendency of each great man to think that he alone is "It." It is well, before reading *Rulers of Kings*, to read the introduction with which it is prefaced. It is rather a cryptic introduction, but still one may gather from it that the book is meant for a picture of what might be, not of what is.

Charles II. By Osmond Airy, M.A., LL.D.: Longmans Green & Co., London and New York.

Mr. Airy's "Life of Charles II," of which a new edition has now been published, may well be called the biography of a bad man. It must be conceded that Charles II was not stupid. In intellect he was probably far superior to his ill-fated father. Nor was there anything small or mean about his character. His faults were all great; but one looks in vain for virtues to balance them. The picture drawn with such calm analysis by Mr. Airy is repulsive in its colossal selfishness and ingratitude, as much as in its Oriental licentiousness. Mr. Airy, however, shows no emotional dislike of the subject of his study. He rather devotes himself to tracing the causes in heredity and environment which worked together to produce this human monstrosity. In heredity he goes back to Henry of Navarre; while the greatest blame for his pernicious education is laid on Charles's governor, the Earl of Berkshire, for whom Clarendon has expressed a profound and unmitigated contempt. It was an excellent selection to intrust this volume in the "Illustrated Historical Series," to Mr. Airy, who had already made the period of Charles II his own in his edition of Burnet's "History of My Own Time." The present volume, reprinted from this series, is a fit companion to the "Oliver Cromwell" of the late Dr. S. R. Gardiner.

The Day Spring. By Wm. Barry. New York: Dodd, Mead & Co. $1.50.

To have wrought so nobly and yet to have failed,—that is the impression this novel gives the appreciative reader. It is magnificently phrased, but it is not vertebrate. It sprawls disconnected, in brilliant flashes of wit, in lurid sweeps of color, in dashes of spirit and power; but it never comes together in organic form, as if the author was disconcerted by the splendor and terror of his own conceptions. Observe the impression made by Paris upon a young man of temperament and intelligence:

"There was much of London in it, much of Hogarth; but, besides this, a peculiar ugliness, mingled with strokes of cruelty, with a laughing or grinning horror which he recognized also in the French illustrations. . . . 'Cruel, base, obscene!' he muttered to himself. 'Who created this world, and these men and women unfit for any other? No God; then was it a devil out on a furlough?' . . . It sickened him, yet he went back to it drawn by some terrible fascination. He was trying to read the secret of the world's misery in great cities. Whence came it? Whither was it on the march. For unlike the millions below, the ten thousand above, he discerned it to be a movement. The pure stars of heaven shone down on this weltering confusion; and a little way in front the grave yawned to swallow it up; but surely that was no answer."

This is significant writing. It has passion, fear, tenderness in it. But he missed the solution. Toward the end his flight even grows feeble, and he descends to the commonplace.

In the Bishop's Carriage. By Miriam Michelson. Indianapolis: The Bobbs-Merrill Co. $1.50.

This is a clever story, and very human. It tells, in the form of an autobiography, the adventures of a girl who began life as a nameless waif, abandoned to the cold mercies of the S. P. C. C. Escaping from the prison house of this institution, she fell in with a handsome young Irish vagabond, for sheer love of whom—perhaps partly for love of excitement and danger—she learns how to pick pockets, as well as to assist in more difficult operations in the way of burglary. Even at this period of her career you cannot help liking Nance Olden. She is so quick of wit; she has, spite of the battering of circumstances and the crooked ways into which she wanders, so much brave sincerity at the bottom of her; above all she is so feminine. She is as feminine in her loyalty to Tom Dorgan, the thief, as she is, later on, when Tom has been sent to Sing Sing, and all that part of her life is past, in the thoroughness with which she proves that she can be "as good for a good man who loves me as I was bad for a bad man I loved." Fred Obermuller, the theatrical manager, who discerns Nance's native gift for acting and helps her to a place on the stage, believes in her, altho he knows the worst of her, and ultimately marries her, is drawn, too, with a very lifelike touch. *In the Bishop's Carriage* is not a notable book, it is both farcical and melodramatic. Nevertheless it has, in larger measure than some more pretentious stories, that element which "makes the whole world kin."

Subjective Sensations of Sight and Sound, Abiotrophy, and Other Lectures. By Sir William R. Gowers. Philadelphia: P. Blakiston's Son & Co. $2.00.

This volume contains a number of medical essays, and, as Sir William Gowers is the most distinguished living English authority on nervous diseases, it will doubtless attract no little attention from the medical profession, but it also contains material that will be generally interesting. The lectures on metallic poisoning and on the use of drugs are especially typical of that broad view of large subjects which the well-balanced English scientist is so apt to take. The two lectures which are likely to be of popular interest are those on subjective visual sensations and subjective sensations of sound, which occupy considerably more than one-third of the book. Professor Gowers does not pretend to explain any of the wonderful sensations which, without basis in external fact, have been perceived by certain patients under his care. His careful study of them will doubtless help psychologists in the explanation of some of these mysterious phenomena. The various forms of so-called fortification figures are noted, together with certain arched spectra, which are curious and peculiar. With regard to auditory

sensation, Professor Gowers's principal contribution consists in detailed description of certain observations, in which patients, usually sufferers from some form of middle ear disease, heard not only the special musical note that was sounding, but also as an echo of it another note, usually one in harmony with the first or occasionally even the octave of it. Sometimes these phenomena of audition were associated with the mental delusion of hearing voices. At times, however, simple buzzing in the ears was a sign of the approach of a slight attack of epilepsy, while the hearing of voices, indicating a more serious disturbance of the brain, was a forerunner of severe attacks. The subjects thus discussed are those in which present day physiologists are especially interested, and Professor Gowers's well-recognized conservatism will make his observations of reliable value.

Historic Highways of America. By Archer Butler Hulbert. Cleveland: The Arthur H. Clark Co. $2.50.

Vol. VIII. Military Roads of the Mississippi Basin. The Conquest of the Old Northwest.

Vol. X. The Cumberland Road.

Vols. XI and XII. Pioneer Roads and Experiences of Travelers (Vols. I and II).

Our reviews of other volumes of this series of monographs (Vol. LV, 45, 1215; Vol. LVI, 1203) have given our readers a sufficient idea of their interest and value, so it is only necessary to call attention to the continuance of Mr. Hulbert's great work on the routes of settlement and conquest of our continent. In his discussion of the *Military Roads of the Mississippi Basin* he narrates the Clark's campaigns against Kaskaskia and Vincennes in 1778 and 1779 and Harmar's, St. Clair's and Wayne's campaigns against the northwestern Indians in 1790, 1791 and 1793-4. Our first national road, the Cumberland, was authorized by an act of Congress, signed by Thomas Jefferson, in 1805, and was built from Maryland to Ohio in 1811-12. In his two volumes on *Pioneer Roads* the author describes the evolution of American highways from Indian trail to macadamized road, and gives a vivid picture of the difficulties and discomforts of travel and lodging in Pennsylvania, Kentucky, Ohio and Virginia. The last volume here listed is devoted to the Old Northwestern Turnpike through Virginia and the Genesee Road in Central New York. Dickens's tirade on American methods of traveling is so well known and easily accessible to every reader that it was a mistake to quote from it extensively to the exclusion of more unfamiliar matter.

Socialization of Humanity. By C. K. Franklin. Chicago: Chas. H. Kerr & Co. $2.00.

On the basis of a monistic or naturalistic theory, Mr. Franklin undertakes to trace the laws governing nature, mind and society. Much is made of the law of repetition and the law of least expenditure of energy, or, as Leslie Ward has put it, the law of parsimony. Mind, morality and society are simply Nature's means of securing greater efficiency in the pursuit of its end—the organization of its materials. Society, the most economical, and therefore the most powerful, instrument to this end, is now reaching its highest state, that of consciousness of its existence and its aims. When this state will have been entered, society will reconstruct itself in accordance with the laws of its being. Unfortunately the book is marked by an intolerable diffusiveness and an often wearisome repetition of ideas, but he who is strong enough to struggle with it will find wheat in the chaff. In one respect, Mr. Franklin has the advantage over writers like Tarde or Ward, who have treated the same questions with far greater knowledge or scientific precision, in that he is committed to a definite program of social reform, the basis of which is to be found in this work.

The Givers. By Mary E. Wilkins Freeman. New York: Harper and Brothers. $1.25.

A reprint of New England stories published originally in *Harper's Monthly Magazine,* and, while of unequal merit, having a gleam of sunshine across their quaint portraits of undeniably queer people. If more people were queer in the same way as faithful Aunt Sophia, the real heroine of the title story, the world would be a saner and more truthful place.

Literary Notes

THE "First Report of the Tenement House Department, 1902-1903" recently published by the City of New York in two large volumes, comprises an immense amount of valuable data on tenement house problems, well illustrated with maps, diagrams and photographs.

....Those who are interested in dietary reform—many people are and more should be—will find many useful suggestions in two books by Eustace Miles, "Good Digestion" and "Some of My Recipes" (Dutton & Co., New York, 75 cents), which discuss the possibilities and practicalities of a semi-vegetarian diet.

....Houghton, Mifflin & Co., Boston, publish in a single volume of over 700 pages at $3.00 a very comprehensive selection of "English and Scottish Popular Ballads," taken from the collection of the late Francis James Child. The critical and explanatory notes and the glossary are sufficient for any reader except a specialist.

....The latest volume of Lucas's edition of "The Works of Charles and Mary Lamb" contains "Dramatic Specimens and the Garrick Plays." As we stated (LV. 2408) in reviewing the earlier volumes, this is the most complete and comprehensive edition of Lamb's works, both as to text and commentary. (Putnam's, $2.25.)

....The Atonement and the Modern Mind, by James Denney, D.D. New York: A. C. Armstrong & Sons, $1.00. The author tells us that this book may be regarded as a supplement to his former work, "The Death of Christ; Its Place and Interpretation in the New Testament." Believing that much of the objection to the doctrine of the atonement is due to misconceptions, the writer here makes "an attempt to commend the truth to the mind and conscience of the time." It is a strong book, but is not easy to read.

Pebbles

A WICHITA (Kan.) Democrat refuses to vote for Henry G. Davis for Vice-President, since learning that he is an "octogenarian." He says he will never vote for a man who is even one-eighth negro.—*New York Tribune.*

...."To run a newspaper," says an Oklahoma editor, "all a fellow has to do is to be able to write poems, discuss the tariff and money question, umpire a baseball game, report a wedding, saw wood, describe a fire so that the readers will shed their wraps, make a dollar do the work of ten, shine at a dance, measure calico, abuse the liquor habit, test whisky, subscribe to charity, go without meals, attack free silver, defend bimetallism, sneer at snobbery, wear diamonds, invent advertisements, overlook scandal, appraise babies, delight pumpkin raisers, minister to the afflicted, heal the disgruntled, fight to a finish, set type, mold opinions, sweep the office, speak at prayer meetings, stand in with everybody and everything."—*Oklahoma Bee.*

WHAT WE ARE COMING TO.

In a few years we shall read epitaphs like this:

Here Lies
JOHN PITTSBURG SKIBO SMITH,
Who Was Born in a
CARNEGIE TOWN,
Educated in a
CARNEGIE INSTITUTE,
Studied in a
CARNEGIE LIBRARY.
At the Age of 30 He Became a
CARNEGIE HERO,
And Has Now Gone to Be with
CARNEGIE.

—*Portland Oregonian.*

....THE HILARIOUS HEIFER.—An aged Goat chanced to meet a certain two-year-old Heifer of his acquaintance one morning who was gamboling lightly through the fields in a very hilarious manner. "Good morning," said the Goat. "What has occurred to make you so joyous?" "I am to be taken to the slaughter house to-morrow," replied the Heifer, smiling. "Great Scott!" said the Goat "what do you find in that to make you so joyous?" "You do not understand the situation in its entirety," said the Heifer, executing an elaborate *pas seul*, "for you must know that the summer boarders are coming on the day after to-morrow, and they bring with them an eight-year-old boy. I shall be out of the way just in time. See?" Moral: Circumstances alter cases.

....Some of our exchanges are publishing a curious item to the effect that a horse in Troy pulled a plug out of the bunghole of a barrel for the purpose of slaking his thirst. We do not see anything remarkable in the occurrence. Now if the horse had pulled the barrel out of the bunghole, and slaked his thirst with the plug; or if the barrel had pulled the bunghole out of the horse and slaked his thirst with the plug; or if the barrel had pulled the bunghole out of the plug and slaked its thirst with the horse; or if the plug had pulled the horse out of the barrel and slaked its thirst with the bunghole; or if the bunghole had pulled the thirst out of the horse and slaked the plug with the barrel; or if the barrel had pulled the horse out of the bunghole and plugged his thirst with a slake, it might have been worth while to make a fuss over it.

Editorials

In a Balcony

A CERTAIN editor has escaped the close confinement of city walls and the atmosphere of commercialism. His balcony looks to the south, but is overarched with the great swinging limbs of a huge elm. Up the elm climbs, hand over hand, a warm-hearted Virginia creeper, until at last it looks through its telescopic blossoms straight into the editorial eye. Slowly swinging, in an old-fashioned Mexican hammock—the only decent hammock in the world, we look contemplatively back into the heart of the flower. A huge bowl of nasturtiums stands on the parapet in front, and a bunch of Papa Gontier roses fills the niche at the east. Around us lie THE INDEPENDENT, *The London Spectator* and the daily papers with huge headlines about the Japs, and the strikes, and the world's turmoil. It is curious to think of a life which these things represent, so far away from present surroundings, and so interesting, when not fully realized. Can it be possible that there is war in the world? Are there hospitals full of wounded men and battle fields strewn with dead and dying? To us these things are, just now, the dream side of life—no more real than medieval romance. For this reason we are holding in one hand one of the tiny volumes of McCracken's "Romance Switzerland"—not reading exactly, but creating an atmosphere; to some extent trying to realize that cities do exist and armies do march.

Our balcony overhangs a flower garden, full of roses and great heads of phlox, and, over to the right, a tennis court. Very rightly, the racquets and balls lie quiet, and the players are hid away in arbors and under apple trees. To the left there is an orchard, where the apples are already being painted by the sunshine, and a vineyard where the clusters are full of October promise Everywhere depths of green! everywhere shades of green! The most wonderful thing about the country in late summer is the infinite variety of hues in the green foliage—from the golden green of the golden poplar to the intense darkness of the Norway maple. Far through all these are glimpses of yellow wheat fields, on opposite hill sides; oat fields a little greener; groves of the original forest; a creek moves leisurely through the valley, and feels its way around great patches of golden rods, and spends a lot of time watering willows. The nearer it gets to the mill, where it must turn the wheels, the slower it goes.

Somewhere down under the thick foliage a young rooster is trying his voice. He tries and tries again until he nearly strangles with eloquence. He is probably about to take his diploma from the incubator It takes time, youngster, to become a real rooster; just as it takes time for any other graduate to become a man of common sense and social value. Now a catbird jumps out of the foliage, perches on a limb close by and sings his soul out to you. Wonderful fellow—the only bird that comprehends human beings! Parrots try to talk English, or French, and make a bad mess of it. The catbird knows better. He talks bird language, which is the most wonderful thing ever yet invented. Talk of a universal language! Birds have had Volapük these thousands of years. Yes, my sweetheart! when we get this idea down editorially, we will talk with you. And for five minutes, which is as long as a catbird can sit still, we whistle and talk. Then he dives away into his romance of domestic life, and we pick up once more "Romance Switzerland." Fortunately, we are very still in the hammock for a moment, for a huming bird has discovered our nasturtiums, and, like an animate ray of light, or, rather, an animated spectrum, he poises himself to look at the editor, and then examines the nectar cells of the flowers. For exactly six minutes we keep perfectly still, while round and round the bowl he flits and dips his bill, and we study his marvelous beauty only two feet from our book.

A daughter of Eve opens the door and

brings to our side a lunch of blackberries and cream. She asks us not to rise, but places a dainty, old fashioned stand, a dainty bit of a table, real cherry, just at our elbow. Is this the real, old work-world or is it a fairy world into which we have transmigrated? What a lot of thought-worlds the old world of matter contains! And as for the berries, what does the world hold so fine as a thoroughly ripe, luscious, glossy blackberry, with plenty of country cream; in a balcony; in a hammock; waited on lovingly by Gladys on one side and a hummingbird on the other! A bit of shower suddenly breaks softly overhead, sprinkling the gardens and the lawns, while we are eating and conversing. The bees start for home with startling rapidity, fairly tumbling over each other in their haste to get to shelter. We can see them just on a line with our balcony. We know also, what we cannot see, that the bumblebees are hiding themselves in that long row of hollyhocks which flanks the drive above the barns. There they are of a morning, still drowsy in their satin cottages and drunk with sweets and sleep.

Russell Sage, as our readers know, does not believe in vacations. Nature does. She has pinned her faith to constant recreation, but she has also prepared ahead of time for ten millions of outings. You cannot understand the country from any other standpoint. The wisest man is he who works in with nature, hunts up her pleasantest retreats, makes them more pleasant, and uses them, not for money only, but for manhood. The modern drift that is turning inhospitable canyons into hospitable rest-cures is right and wholesome. An honest sort of home has nooks and corners, hammocks and balconies, and a peaceful atmosphere. It knows how at times to turn work out of doors.

To make mock of meditation, and sport of our balcony, a train of cars bursts in at the south end of the valley, roars through the whole length of it, leaves a thread of bituminous smoke across its diameter, searching everywhere for cities, and factories, and crowds—caring not at all for peace and romance. Commerce and manufactures! hustle, bustle and jostle! Get out of your hammock; an editorial must be written. Life tolerates hammocks and balconies, humming birds and blackberries; but it still repeats its "Thou shalt." Thank God, man shall not live by work and bread alone, but by every word and thought of gentle peace and rest that is distilled in the well of a pure soul.

The Democratic Party, Trusts, and "the Plutocracy"

SINCE the adjournment of Congress, and even since the assembling of the delegates at St. Louis, the attitude of the Democratic party toward Trusts and "the plutocracy" has undergone an interesting change. We mean the attitude of the party as it is shown by the party's national nominees, their preferences and associations, their utterances, and the preferences and records of the men who are the nearest political friends of these nominees and to whom the management of the campaign has been intrusted. This deserves consideration because it is a curious and significant incident of current politics.

Only a few months ago the party's spokesmen in Congress were denouncing the President for his alleged failure to enforce the Anti-Trust law, except in the case of the Northwestern railway combination. Even in that case, they asserted, he deserved censure for declining to enforce the criminal provisions of the act. He would not use available evidence against the anthracite coal railways, they said; nor would he proceed against any of the combinations of manufacturers. His Attorney-General had proclaimed his surrender to the Trusts by announcing his determination not to "run amuck" among the corporations. Resolution after resolution, designed to expose the insincerity and weakness of the Administration on this subject, was offered in the House. A few weeks later the party pointed to the transfer of Mr. Knox to the Senate as proof of an alliance between the Trusts and the Government. Has any one heard even the faintest echo of these protests and denunciations since the St. Louis convention?

The change of which we are speaking was foreshadowed by those passages in the platform of the New York Democrats which were generally interpreted

as meaning that State-chartered corporations should be regulated by State, and not by Federal, authority—passages that had the approval of Judge Parker before they were adopted, and that led Mr. Bryan to say that "Parker, alias Belmont, would mean that organized wealth would continue to plunder the people as mercilessly as it does now." It is true that the New York platform was not repeated or embodied in the platform adopted at St. Louis, where Mr. Bryan procured the insertion of a demand for a new grant of power to the Interstate Commerce Commission, and for additional laws excluding from commerce between the States any combination that monopolizes a branch of business or production.

But it is also true that, at the close of the convention, Mr. Bryan declared that this part of the platform had been "nullified by the nomination of Judge Parker," and it is true that the latter's remarks about Trusts, in his speech of acceptance, are decidedly at variance with the spirit of the platform and the policy supported by his party in Congress and elsewhere before he was nominated. We suppose that it was due to Mr. Bryan's knowledge of the attitude of Judge Parker's supporters that he remarked that "for the time being the party is controlled by the plutocracy," and that "the triumph of the Wall Street element" at St. Louis "denied to the country any hope of relief on economic questions." This gloomy conclusion had been confirmed by the nomination of Mr. Davis, clearly a plutocrat (from Mr. Bryan's point of view) and a protectionist of the Gorman school, who has accumulated a great fortune in railroads and protected coal mines.

It is by the selection of party managers that the change of which we are speaking has been quite plainly shown. We would not be understood as suggesting that there is anything discreditable in the business pursuits and relations of these gentlemen, or in the wealth which a majority of them possess; we are merely pointing out the evidence of change which is furnished by these relations and this wealth. Going back to the organization of the New York committees, after the State convention which called for the nomination of Judge Parker, we see that the gentleman placed at the head of the State Committee was Mr. Cord Meyer, whose refining company was one of the organizers and original members of the Sugar Trust. The attitude of the Democratic party toward that combination in the past has been one of relentless hostility, modified, however, on one occasion by its legislative agents in the Senate. Again, the chairman of the State Executive Committee is Mr. Patrick H. McCarren, who, at the time of the first investigation of the Sugar Trust, at Albany, was the only member of the Legislative Committee who did not sign the report, which was quite hostile to the combination. He dissented. We understand that the selection of Mr. Meyer and Mr. McCarren was approved, if not suggested, by Judge Parker. At about the same time it was announced in the press that Mr. John E. Parsons (who attained some celebrity in his profession as the maker of the Sugar Trust's original agreement or compact) had decided to support Judge Parker with such influence as he could exert.

The National Executive Committee was more recently appointed. We suppose that Mr. Bryan would say that Chairman William F. Sheehan, altho not yet a plutocrat, is subject to plutocratic influence. Mr. Sheehan is a director in and counsel for several railway and municipal lighting corporations, and thus may be regarded as representing certain very powerful capitalistic interests in New York. He is the intimate and trusted friend of Judge Parker. Mr. August Belmont, a member of the committee (whose efforts are believed to have been very influential in bringing about the Judge's nomination), must, we suppose, be classed by Mr. Bryan with the plutocracy. As a banker, the American representative of the Rothschilds, he has acquired a very large fortune. A director in a score of banks, Trust companies and railway corporations, he is the head of the company controlling the elevated roads and new subway in New York.

Colonel Guffey, another member, "the largest individual coal owner in the United States," has millions invested also in gold and silver mines, in natural gas and in oil. Some say he is an ally of the Rockefellers. He controlled the large

and influential delegation from Pennsylvania, which decided at an opportune moment to vote for Judge Parker. Ex-Senator James Smith, Jr., of New Jersey, the wealthy banker and manufacturer of leather, was, while in the Senate, if our memory serves us, in sympathy with Mr. Gorman's attitude toward the Wilson Tariff bill. Another member, Mr. John R. McLean, is largely interested in the Washington street railways, and is not regarded at his old home in Ohio as an earnest friend of political reform. The vice-chairman, Mr. Nicoll, is a director in financial institutions and counsel for the gas monopoly in New York. The treasurer, Mr. Peabody, a wealthy and philanthropic banker, was the treasurer of the Palmer and Buckner revolt, and is a director in many railroad and other corporations, including the American Beet Sugar Company.

Such is the party's Executive Committee for the campaign. And the man whose possible candidacy for the office of Governor of New York now meets with general approval is Mr. Lamont, a Vice-President of the Northern Pacific road and a director in 24 steamship, banking and railway corporations, one of these being the Northern Securities Company, against which Mr. Roosevelt successfully enforced the Anti-Trust law.

This is some of the evidence of that change of attitude which we regard as a curious example of the unexpected and unforeseen in American politics. It does not follow, as Mr. Bryan said it did, that the party cannot "appeal to the masses" because the "influences back of" Judge Parker "are so intimately associated with Trusts and great corporations;" but the appeal must be made for support of ideas and a general policy differing essentially from those accepted by the Democratic masses until a very recent date.

Barbarism

When Charles Sumner delivered a famous oration in the United States Senate denouncing local barbarism in this country, he was met with angry denunciation and denial by those who claimed that theirs was the highest and finest civilization and culture which the country had produced. It was an indignant high-toned gentleman and Congressman who had demonstrated that his section was not barbarous by smiting Mr. Sumner on the head with a heavy cane as he sat in his chair in the Senate. For years Charles Sumner was a sufferer unable to occupy his seat, and unconvinced by this violent evidence that he was wrong.

That was nearly fifty years ago; and it is not yet clear that the barbarism has yet been removed. There has certainly been great improvement, following the Civil War and the changes in society. The establishment of a system of free public schools, imperfect tho they are, has made a mighty change. So has the breaking up of the great plantations and the growth of a body of small farmers. But the enormous mass of illiteracy yet remaining represents the continuance of barbarism, for ignorance is the essence of barbarism. Equally the maintenance of a horrible prison system, with the fetters and the lash, is barbaric.

But the saddest illustration of local barbarism is in the anarchistic contempt of law shown in murders of violence, not by secret enemies, but by masses of the people who represent apparently the general population. Such an example is that in Statesboro, Ga., which has horrified the country the past week.

This was no sudden outbreak of a frenzied mob gone crazy with uncontrolled passion. It was cool, deliberate, carefully planned murder. A week ago a dispatch was sent over the country that two men guilty of the brutal murder of a family, and thirteen others supposed to be accessory to the crime, had been taken from the officers of the law and lynched. It was not true; it was only what was intended, and the news was anticipated. The next day the two men were convicted by a jury and the judge condemned them to death. There was no question that they would be speedily executed. But a legal execution would not satisfy the people. Every one knew what was planned. The brother of the murdered man begged the crowd to allow the law to take its course. The judge did his best to maintain the honor of the court and of the State of Georgia.

The Governor sent a company of supposed soldiers to protect the jail. But what are soldiers without bullets? The guns were not loaded. Sheriff and soldiers were but playing at keeping the peace. They allowed the mob to come upon them and seize their guns and capture court and prison and carry the prisoners into the woods, chain them to a fat pine stump, pour gallons of kerosene over them and set them on fire and consume them in the flames. Meanwhile the hundreds who did this deed wore no masks; they walked in plain daylight without concealment, without shame and with no suspicion of danger, while a photographer took pictures of the scene. It was not a case of uncontrolled passion; it was carefully planned and cold blooded. It was not the act of the riff-raff of the city slums, but that of the well-known "best citizens" of the town of four thousand inhabitants. And after this burning the other suspects were hunted up, and no one knows yet how many of them were killed.

Doubtless it was a horrible murder of which those two condemned men had been guilty. They had brained a man and his wife, and then to hide their crime they had set fire to the house and killed the two little children. They deserved swift punishment by legal execution. But an occasional murder is not general barbarism. Barbarism exists when such crimes are left unpunished, or when the community takes in its own hands the execution of public vengeance. Barbarism is the denial of law; and the denial of the law is barbarism. This is the point that we wish to emphasize, the fact that we wish to drive home, that when people overthrow law, and are content to have it so, they are barbaric. In this case the cowardly sheriff, the puny pretense of the soldiery and the populace which seized their victims from the unresisting hand of the law, and then made a photographic holiday of the sport of burning two of their fellow men, combined to create this a perfect illustration of local barbarism such as Apache savages could not have surpassed.

The Governor of Georgia seems to take it very easily. It did not interrupt his journey to visit the St. Louis Fair. The newspapers of Georgia and the neighboring States will indulge in some necessary reflections on the unfortunate incident, and some of them will express themselves with deep indignation and just shame. But nothing will be done—nothing ever is done among barbarians. They have no sense of wrong, and the community justifies them, or satisfies itself with mild apologies. Life is cheap; public vengeance punishes wrong with no regard to law; there are more murders, says the responsible rector of a church in Birmingham, Ala., in that county than in all Great Britain, and none punished. Only occasionally do the people rise and lynch a man who has committed a crime unusually offensive. Distinguished editors in Charleston or Columbia are shot and the murderers acquitted. In a Colorado district law is forgotten, overturned, and a hundred men are driven forcibly out of the State, and the people justify themselves on the ground that they are simply recurring to the original rights of the folk-mote, the town-meeting.

We have said no more than the occasion demands; we can say no less. And yet it is with shame and confusion that we speak; for we would that the disgrace of this barbarism should not be known in China, or Russia, or Turkey. How can President Roosevelt protest against the massacres of Kishenef or Sasûn? Tell it not in St. Petersburg; publish it not in the courts of Stambûl, lest Sultan and Czar shall send messages and deputations to Washington to protest against the barbarities of the Republic of the West.

The Mischief of a Creed

Not yet is it settled how the United Free Church of Scotland is to get out of its distressful tangle resulting from the astounding decision of the House of Lords. As yet the great body of churches which composed the Free Church of Scotland and joined the United Church of Scotland are in dismay. They only know they have lost all their property, all their houses of worship, all their manses, all their endowments for the support of their

disabled clergy, all their missions; and all this accumulation of property is restored by this extraordinary decision to the possession of less than thirty little churches and ministers in the Highlands; and what these Highlanders will do about it nobody knows. Will they be satisfied to receive a generous amount of the endowments, and leave the rest to those who have created them? And if twenty of them consent to do so, will not a remnant of five who refuse for conscience' sake have the legal right to claim, and will they not feel it a duty to claim, all the property for the righteous cause of their faith?

The occasion of this amazing wrong is worth careful study, and its lesson is plain, The decision of the five Law Lords, opposed by two, is, that the Free Church of Scotland, organized under the lead of Dr. Chalmers, was based on certain definitely stated propositions of belief, on certain doctrines of faith. Of these the special peculiar one was that the State should support and maintain the Church. To be sure, the Free Church claimed freedom from control by the State—it only held that the State ought to maintain the Church. Because the State interfered, the Church claimed its freedom, and received no aid from the State, but the State ought to aid it. Herein it differed from the United Church, which was equally free, but believed in separation of Church and State. The difference was purely theoretical and not practical; both were equally self-supporting, but one believed in separation while the other did not. Years passed, and the Free Church ceased to care about its theory, and was satisfied with its practice. There was absolutely no difference between the Free Church and the United Church, and so they came together two years ago in the United Free Church of Scotland; but less than thirty insignificant churches refused to join, claimed that they remained the original Free Church, and claimed all its rights and property; and the House of Lords has affirmed their right.

Here, whatever be the British law, the injustice is patent. The dead hand rules. Because sixty-two years ago the Free Church, withdrawing from the Established Church, refusing to be controlled by the civil power, yet held that it was the duty of the State to maintain religion generally and support the churches, because it held this inconsistent doctrine in 1842, and made the blunder of putting in writing that while driven to Voluntaryism it did not believe in Voluntaryism, therefore now it cannot change its belief and cannot join those who both believe and practice Voluntaryism. That is, a Church cannot change its creed; if ten churches out of a thousand, or two churches, or one, still stick to the old creed, they have the right to all the property acquired by all the majority.

This may be good law. There have been other such decisions. But it is bad morals. Yet it teaches an important lesson. Fixed creeds, which settle how people must believe, are a mischief and a nuisance. Every generation should be at liberty to modify its faith under the light of Scripture, reason and knowledge, and the guidance of the Holy Spirit. To shut the windows against future light is bad policy in money as well as in religion. It is a good plan for individuals to revise their creeds as often as they choose; and there is no objection to very general statements of present belief; but when these are made not *credos,* but *credenda,* not what we do believe, but what we must and will believe, they are dangerous and wrong. It is these formulated systems of required faith that keep Churches from uniting. This is the trouble that the various Presbyterian denominations are now finding. How easy it would be for them to unite if they only had no creeds. This is the lesson of the trouble of the Free Church of Scotland.

A Sensation-Ridden People

In concluding his superficial but clever and suggestive book on "Success Among Nations," Dr. Emil Reich indulges in gloomy forebodings for America. He says:

"We cannot deny that a close study of American history and of American institutions inspires us with far more apprehension as to a sound development of America in the future than with fear for the fortunes of Europe. The path of America is strewn with stumbling blocks which it will require her utmost ingenuity to circumvent or to surmount."

Chief among the causes of peril Dr.

Reich places the mental and moral qualities of American men and women. The American woman, as he observes her, is going to pieces through "over-mentalization," through the cultivation of a "fierce energy" that "bids fair to culminate finally in her absolute physical breakdown." The American man, in his turn, "is lacking in natural completeness." "His development is far too rapid." He lacks "a well balanced emotional life, and this renders him incapable of applying all his heart or all his intellect to any one thing for any considerable time. He is, indeed, sensation-ridden to an extreme, and his individuality is not well developed."

It would be an easy matter to make a mere debater's reply to these large generalizations, but it would be unprofitable. It is better worth while to reflect upon an element of truth that they contain, and to ask ourselves what we can do, if anything, to avert certain national calamities that every sober-minded American must acknowledge are now threatening our civilization.

To go to the heart of the matter at once, Are we a sensation-ridden people? Let us look at the facts without blinking. Would it be possible for such horrors of savagery as the recent Georgia lynchings to occur in a community emotionally well balanced, calmly rational, clear visioned? Such a thing is inconceivable. With utter shame and humiliation we are obliged to confess that wide regions—not all of them south of Mason's and Dixon's line—in this great country, are populated by nominally civilized beings that are capabl upon the slightest provocation of giving themselves over to murderous frenzy.

Of the remainder of the American people, made up of those millions that are on the whole industrious, law-abiding and generous-minded, what shall we say? Is Dr. Reich's allegation untrue of them? We wish that we could say that it is wholly untrue, that this critic was altogether mistaken in his observations.

Unhappily there are too many facts that go far to bear out his assertion. Whence come the millions of dollars that pour into Wall Street promotion offices, in response to bonanza advertisements, that any man not a fool or a gambler could see through in a minute if he were not too sensation-ridden to think? To whom do the scareheads of American newspapers, which would be laughed at in any European country, make their appeal day after day, when everybody knows that they are not only untruthful, but also inane? What are the theaters that are crowded night after night in all our large cities? Do we expect to see there any artistic production of true drama? Have we not almost forgotten what true dramatic art is, while giving ourselves up to spectacular "shows," to overwrought melodrama and to the imbecilities of vaudeville?

And these indications of American character are unhappily but few among many. America has long been the home of sensational preaching in the churches, of fantastic religious experiments, of absurd tricks of political campaigning, and of a development of advertising that can only make the dispassionate observer ask whether it is possible that a great people really is bamboozled to the extent that the advertisement writers evidently assume.

Can we deny that a people which, whether it be altogether sensation-ridden or not, unquestionably does give itself over to sensationalism far more than is consistent with a sound emotional and intellectual development, is, as Dr. Reich warns us, in very great peril? Al. good Americans believe that we have too much saving common sense ever to rush madly into a great foreign imbroglio, or, in a moment of wild unreason, to overthrow the great foundation structures of our political system. But such dangers are less grave than more insidious transformations of our characters and institutions. In the increasing disregard of law, in the disorders accompanying the struggles between labor and capital, in the indifference to a corruption of politics and justice by an unscrupulous commercialism, we are perhaps reaping fruits of sensationalism more deadly than foreign war or domestic rebellion.

What this country needs above all things is a more patient and thoroughgoing intellectual life. We have plenty of cleverness, plenty of intellectual *verve* and brilliancy. We need to cultivate by means of all the resources of our educational organization a calmer, a more persistent, a more substantial rationality.

Advertising Health and Happiness

PROBABLY no branch of practical science has made more advance in the last few years than has applied psychology in the matter of advertising. Advertising is simply a form of popular education; a school extension where any one with money enough may try to teach and where all the world are compulsory pupils, altho none pay tuition except those who learn the lessons, a marked difference in this respect from other schools. In this department of pedagogy, as in the others, it has been discovered that it is easier to lead than to drive; that promises are better than threats. Accordingly we find a great change has been effected in the character of popular advertising. It has become optimistic in the most pessimistic of surroundings. Advertisements are the idealistic blossoms of commercialism. The imagination, driven out of the stories and poems in the body of our magazines, has taken refuge and finds free play, unrestricted by prosaic facts, in the advertising pages.

Not many years ago our medicine men advertised their remedies by pictures of men and women in anguish from divers diseases. Now the pictorial invalids are all beautiful and in blooming health, often reclining gracefully in charming *negligé,* while they sip mineral waters or eat medicated candy. The names of the diseases, they could hardly be called complaints, to be cured are appended, but there is no look of worry or apprehension on their smiling faces, for they know they can be easily and pleasantly cured. Formerly long lists of distressing symptoms were forced upon our attention and under the influence of the suggestion we found on introspection that we had most of them. Now we are appealed to on every hand to be well and strong, and we unconsciously are affected by it; how much none can say. If mental suggestion will not set a broken leg, it is not certain that it will not stimulate a phagocyte to kill a microbe.

Once the advertisements were as full of crippled and ulcerated persons as the steps of an Italian cathedral. Now in their place we see men and women of statuesque figure, or athletes pridefully swelling their muscles. Instead of being threatened with dyspepsia if we do not take a certain medicine, we are offered *menus* of the most palatable and indigestible dishes with the assurance that we may eat of them with perfect impunity if the meal is preceded or followed with the specified draught.

Foods are now advertised more than medicines, a change for which we should be very grateful. Riding on the street cars is now nearly as delightful as looking into restaurant windows. On every hand we are offered breakfast foods which require no cooking, no chewing and no digesting. We can get an appetite for supper on the way home by looking at the many attractive dishes which can be made from baled hay by putting with it something that tastes good.

Condiments, sauces and pickles in many varieties, acting on the salivary glands through the optic nerve, prepare us for the meal to which we are speeding. The moral influence of health foods seems to be even greater than the physical, for we see before us men whose ugliness of feature and emaciated figure would be expected to make them miserable for life, yet in spite of it setting a good example to a gloomy and dyspeptic world by their sunny dispositions and ineradicable smiles.

How delightful it would be to live in Advertisement Land; where pots and pans reflect only smiling faces and white-robed women emerge spotless from through trains; where all the shoes fit and the lamp chimneys never break; where the ink flows freely from the fountain pen and the doors of the book shelves never stick; where culinary and detergent operations can be performed in Paris gowns and the children are all happy and good natured; a land where cleanliness and godliness both come easy. There we find self-playing pianos, self-rising flour and cameras that require only the pressing of a button. Life there would be as lazy and luxurious as in tropical lands where, as we read, one has only to lie on his back in the shade all day and open his mouth at dinner time to let a ripe banana or a cocoanut drop in. There is no chance for the utopias of the socialists, so long as capitalism spreads before us such visions as these.

We owe much to those who at the expense of millions of dollars so cheer us up, and fan into flame the spark of hope. When the sad realities and disappointments of life depress us we can read advertisements. It is pleasanter, as well as safer, to look at the placards in the car than at the other passengers. The girl opposite has regular features and a fair complexion, but spoiled by her impassive face and stony stare. Yes, and even as we look, she betrays a temper by the indignant glance and curl of the lip with which she rewards the compliment of our respectful and admiring, tho perhaps too prolonged, gaze. Never mind, we will look up and not down, for just above her head is a maiden far fairer, daintily nibbling a chocolate drop, at whom we may stare as long as we like without causing her to avert her roguish eye or the rose on her cheek to increase in area.

One precaution must be taken in order properly to enjoy the beauty of the billboards. It is so obvious as not to need mention. If it is not adhered to disillusionment is sure to follow sooner or later, and the canker of distrust will spread until one can no longer take delight in the beautiful and attractive objects offered him. The wise man does not go behind the scenes at the theater, nor look at the back of the canvas in the picture gallery. The Land of Advertisements, like the enchanted city of the Arabian tale, exists only for those who refuse to enter therein.

The Archbishop's Visit

A correspondent this week welcomes the Archbishop of Canterbury to these shores, the first time that a Primate of England has ever been in this country. If we cannot approve the Archbishop's position on the religious education question in England, we can be grateful to him for his rebuke of Balfour and the Tory party in Parliament for their submission to the brewers in the late act protecting the public houses. Yet, as our correspondent says, it is his position on the matter of the Athanasian Creed which most interests the English Church just now. The late Professor Hort, in a letter just published, said:

> "There is some real faith in the Incarnation left in various quarters, but in England the Trinity seems to have become the merest dogma. It has been killed, we fear, by that hapless '*Quicunque Vult*' and its substitution of geometry for life."

Canon Scott Holland says of this Athanasian Creed:

> "We squirm and shudder to hear its subtle phrases bandied about heedlessly by roaring choirs, while behind can be felt, like a frost, the grim and frigid recusancy of a crowd which is fatally misinterpreting and misjudging every other word."

But the Archbishop will hear nothing of the "*Quicunque Vult*" in this country. Here no choir will roar or ripple the gracious words that teach that those will perish everlastingly who do not hold the transcendent mathematics of this falsely named Athanasian Creed. The Church of all its branches will heartily welcome our distinguished visitor.

Bishop Potter's Saloon

We gave three weeks ago the experience in the "Subway Tavern" of a visitor who does not hesitate to take his whisky straight, and who found the sandwich and beer excellent and the place agreeable Another later visitor is less impressed, but he did find written with soap on the mirror behind the bar the words "Temperance is promoted by every man paying for his own drink," and he was told that treating was not allowed. Here, however, his favorable observation ended. He says:

> There is a sign, "This Way to the Water Wagon," over the barroom side of the door that leads from the barroom into the soda water room in the front. That shows every man standing at the bar that water drinking is ridiculed by the men running the Subway Tavern. The thing that impressed me most was the untidiness of the place. Your representative found it "cleanly and attractive." In the barroom two lean cats were foraging for dinner among the pieces of bread and sausage, cigar stumps, burnt matches, etc., on the floor.
>
> In the soda water room there is no special provision whatever for women, and the dispenser of soda did not even have on a white jacket and apron. I called for coca cola, but could not get it, and failed also to get a cherry phosphate, but did get a not by any means ice cold glass of root beer. By the quite cheap-looking, not very clean and unattractive soda water fountain was displayed a card sign, with

this invitation to drink beer: "Good Beer and Good Soda Water Are Both Harmless if Taken Moderately."

I sat down at a table where the man on the other side was a nicely dressed person, drawn thither like myself by his curiosity. He had before him a full glass of beer, and as I took my seat, he said: "What do you think of this business?" "That," said I, "is just the question I was about to ask you." "Well," said he, "I can answer that very easily; it is a —— —— humbug. I have been a patron of saloons all my life. I used to drink more than was good for me, but now I drink only three or four glasses of beer a day. If you know Bishop Potter please tell him that the Church can't run a saloon that men that want a saloon will patronize. This place is a proof of it. Tell him that this will soon be nothing but a 'bug house.' I don't go much to churches, anyway, but I've no use for them at all when they begin to run saloons."

The literature displayed on the table in the barroom consisted of two old magazines; no newspapers of any kind. Indeed, I could find nothing like an attractive Poor Man's Club in this saloon as I saw it.

The test of it will appear when the novelty wears off. Other earnest Church people will safely wait and observe before rushing into further experiments in Church saloons. We observe that the Episcopal papers are silent or disapprove. The New York *Churchman* says nothing, and the Philadelphia *Churchman* calls it "a mortification and an offense."

The Hawaiians for Hawaii

It was with fear and trembling that Congress made the experiment of generous and fearless suffrage for the native Hawaiians, and the first and second legislatures justified the fear, for nothing worse has existed in the history of American legislation. Professor Moses, of the University of California, lately a member of the Philippine Commission, declares that general suffrage thus given to a people without experience was a foolish and dismal experiment. We admit it was dismal, but not that the experiment was unwise. Even babes should learn to walk and boys to swim. Those Hawaiians have had their experience, and have learned their blunder. Now they are turning down the scoundrels, native and carpet baggers, whom they first elected, and are supporting an administration that has not a single native in its official family, and which represents the very best elements in the population. The Hawaiians can learn, as well as other people, and we would rather that they be taught by experience how to rule wisely. We hope that Professor Moses will make another visit to Hawaii, and that he will have patience with the errors of an inexperienced people, and not lose faith in self-government.

It is a curious report that comes to us that after all the Sultan has hoodwinked Mr. Leishman, our American Minister at Constantinople, and that now the American fleet has left Smyrna there will be new delay in granting the rights of the American institutions in Turkey. It must be very humiliating to Mr. Leishman if such is the case, and will disturb Mr. Hay's equanimity. But Mr. Leishman has not proved himself the most astute of diplomats. Perhaps a more capable man may be sent to attend to the business. We recall that it was only when he had been relegated to innocuous inactivity that Miss Stone was rescued.

We are pleased to hear of an apartment house just built in upper New York, the owner of which plans it for families with children, much after the style of that suggested by Mrs. Gilman in her valuable article in this issue. There is a big playroom on the top floor, and a large backyard with swings, etc.; and the owner offers to give a month's rent free on the birth of any child in the house, and two months for twins. May the tribe increase!

Judge Mullins, of the State District Court of Colorado, has declared on the bench that he will sentence no man to death, no matter what the law or what the crime for which the man is convicted. That is Colorado lawlessness. Judge Mullins is under no compulsion to hold office, but if he accepts office it is his business to execute the law as it exists. It is no excuse to say that he does not believe it right to kill a murderer, for he is not compelled to sit on the bench and administer the law.

Insurance

The Adjustment of Fire Losses

THE New York Board of Fire Underwriters has for more than a quarter of a century been concerned with efforts made to devise some satisfactory method of combined adjustments in New York City, where both the needs and the opportunity for a radical and drastic reform have long been evident. The absurdity and unnecessary expense of employing a large number of men to do the work of adjustment, which could be done better and far more economically by one or two, is apparent even to the layman. Looking toward the creation of some satisfactory method of the economical and equitable adjustment of fire losses, a standing committee on losses and adjustments was appointed by the New York Board of Fire Underwriters. This committee began operations on May 5th, 1902, and has accomplished much in a variety of ways. Their second annual report recently issued makes interesting reading. Among the items considered during the period which has elapsed since the work began have been the disposition of salvage stocks, the rights of the companies as affected by certain kinds of action on the part of the building and fire departments of the city, the joint action of the board and the civil authorities in the matter of preventing and punishing arson, the presentation of fraudulent loss claims, and the protection of policyholders and the insurance companies from public adjusters with known bad records. In many cases steps have been taken which promise considerable improvement in general underwriting conditions. The current report shows a large increase in the volume of business handled by the committee, and there is a growing interest in the "New York System" of handling loss adjustments, the result of which has been so successful that its introduction is now being considered in Boston, Philadelphia and other large cities.

This system, which has had its inception under the inspiration of John M. Whiton, the president of the board, is in brief the reference of all fire losses to a standing committee working under the control of the New York Board of Fire Underwriters, with such rules and regulations as the board might approve. All the adjusters employed by members of this central body are first approved by the committee as to ability, integrity and business experience. They are officially styled "Adjusters of the New York Board of Fire Underwriters." It has been found in actual practice that by the new system the possibility of turning in "padded" claims has been greatly diminished and the temptation toward incendiarism for financial profit has but exceedingly slight encouragement.

The present system is giving increasing satisfaction, not only to companies, but to the insured, who, while receiving the full amount of their claims, are brought into direct contact with the companies, without the intervention of that fruitful source of trouble and misunderstanding—an unnecessary middle man. A much nedeed reform in the adjustment of fire losses is generally regarded as now fully established, and it is a step in the right direction. Adequate rates are necessary, but they cannot be ascertained and are insufficient unless accompanied with a wholesome economy—too often neglected

THOMAS BRADLEY, of Philadelphia, has been elected President of the Security Trust & Life Insurance Company. Mr. Bradley is at the head of the Great Western Meat Market of Philadelphia, and was a personal friend of the late President, ex-Governor Pattison. He will make his headquarters at the home office of the company, St. James Building, this city. The other officers of the company are: George B. Luper, Vice-President and General Manager; Savery Bradley, Second Vice-President; Moore Sanborn, Third Vice-President and Manager of Agencies.

Financial

Steel Pool Prices Falling

At last the pools or combinations maintained for some years past in the leading branches of the iron and steel industry have been undermined and are going to pieces. So far as they could be controlled by nearly two-thirds of the output, they were dominated by the great Steel Corporation; but control can no longer be exerted by such a majority interest. Following the recent and memorable conversion contract by which the Pittsburgh Steel Company (which makes wire products) obtained from the Republic Company 110,000 tons of billets, its raw material, on terms virtually making the price $19, instead of the pool's $23, the Corporation has largely reduced its prices of wire products, and it is admitted that all the pools except the rail combination have practically been dissolved. This was inevitable, because the pools' prices have been much too high—except to foreign buyers. It will be seen that the reductions have been forced by comparatively small independent concerns, which do not enjoy those "economies of production" which some have assigned exclusively to the great Trusts. It may be that as a result of this quarrel American consumers will be able to buy the products of American iron and steel factories as reasonably as the same products are sold to foreigners; but the level of the export prices has not yet been reached.

Governor Odell's Claim

THE complaint in Governor Odell's suit for the recovery of $126,000 lost by reason of his investment in the bonds of the United States Shipbuilding Company makes numerous charges of fraud against the defendants. Indeed, the allegations of fraud in passages of this complaint which have been published are even more numerous and of a more serious character than those which appeared in the official report of the Receiver, ex-Senator James Smith, Jr. They include assertions that the underwriting of prominent institutions was fraudulent and that the promoters knew it to be so; that the prospectus, which is considered in detail, abounded in fraudulent statements; and that the defendants fraudulently assured the Governor that $6,000,000 in cash was to be paid to the owners of the several concerns for their properties, knowing that by agreement "at least $2,346,000 of this sum was to be retained by or repaid to the defendants as their secret and fraudulent profit." It is stated by the press that the claim of Mrs. Wood, like that of Mr. Kavanagh, has been paid by some one, and will not engage the attention of the courts; but a similar payment of the Governor's claim does not appear to be expected by persons acquainted with the case. It is now asserted by the press that some documentary evidence upon which the Governor relied, relating to the underwriting and the sums to be paid for the shipyards, is no longer available. On the other hand, there is denial that the documentary evidence in question ever existed.

BRADSTREET'S reports for the first six months of the present year show a decrease of less than 1 per cent. in railway gross earnings, but a loss of 10½ per cent. in net.

....Exports of steel rails in the last fiscal year were 160,894 tons, against only 22,896 in 1903; the increase in exports of steel billets was from 2,127 to 176,961 tons.

....Walter E. Frew, Vice-President of the Corn Exchange Bank, has been elected a Director of the Bankers' Trust Company, of which E. C. Converse is President and J. F. Thompson and T. W. Lamont are Vice-Presidents.

....The Standard Oil Company's dividend of 5 per cent., payable September 15th, is equal to that which was declared last year at the corresponding time, and makes 29 per cent. for the year thus far. For the entire year of 1903 the dividends were 44 per cent.; in 1902, they were 45 per cent.

....Dividends and coupons announced:

Atch., Top. & S. F. R'way (East. Oklahoma Div.), Coupon No. 3, payable September 1st.

The Independent

Vol. LVII NEW YORK, THURSDAY, SEPTEMBER 1, 1904 No. 2909

Survey of the World

Parker on the Philippines

It was noted by many papers that Judge Parker in his speech of acceptance used the phrase "self-government" instead of "independence" in referring to the future destiny of the Philippine Islands, and it was questioned whether by that he meant territorial independence. In a letter dated August 22d, in answer to an inquiry from John G. Milburn, Judge Parker explains his meaning more fully in the following words:

"You are entirely right in assuming that as I employed the phrase 'self-government,' it was intended to be identical with independence, political and territorial. After noting the criticism referred to by you, I am still unable to understand how it can be said that a people enjoy self-government while another nation may in any degree whatever control their action. But to take away all possible opportunity for conjecture, it shall be made clear in the letter of acceptance that I am in hearty accord with that plank in the Democratic platform which advocates treating the Filipinos precisely as we did the Cubans; and I also favor making the promise to them now to take such action as soon as it can prudently be done."

Taft on the Philippines

The Secretary of War, William H. Taft, addressed a Republican rally at Montpelier, Vt., in which, after discussing the other issues of the day and defending the acts of the President from the charges of rashness and unconstitutionality, he devoted special attention to the Philippines question. He denied the statement of Judge Parker that the Philippines had cost us $650,000,000, saying that "by no possible calculation can their cost be made to exceed $250,000,000 down to the present time." With the exception that Judge Parker thinks that the Filipinos ought to be told now that they will be independent when they are fitted for self-government, it is difficult to tell how the Democratic policy will differ from the Republican policy if carried out. But it would be unsafe to entrust the management of the Philippines in the hands of the Democratic party, for the war in the Philippines by the insurrectos was carried on for more than two years beyond the time when it would have been carried but for the encouragement received by the insurgents from the anti-imperialists and the Democratic party, as is demonstrated by the proclamations issued by the insurrectos at Manila. He finds it quite remarkable that a statesman like John Sharp Winter should be so sensitive

"that the Filipinos are not given complete self-government at once, and yet should be willing to represent the Yazoo district in Congress, elected thereto by a vote of 1,463 persons out of a population of 190,000."

"It is said that we are enslaving the Philippine people. The Philippine people never had such liberty in the history of their country as they are now enjoying. It is said that we are upholding nothing but a despotism. With an autonomous municipal government, a partially autonomous provincial government, with a central government of a commission in which are three representative Filipinos, and with a popular assembly which is to take full part in the legislation of the country as a co-ordinate branch of the legislature in two years, the Filipinos may be under a despotism, but if so the word has lost its usual meaning."

Political News

In Delaware the Addicks Republicans nominated at their State convention the same Roosevelt and Fairbanks electors as the Anti-Addicks Republicans nominated two weeks before, thus insuring harmony on the Presidential ticket. A full State ticket was nominated in opposition to that of the "Regular Republicans," but the State Committee is empowered to make changes in the nominations if necessary to effect a compromise with the other faction.—Mr. Taggart, the chairman of the Democratic National Committee, gave out the typewritten statement that

> "Requests from all over the country for campaign literature have been received in great volume at Democratic national headquarters. It is estimated that before the close of the campaign 15,000,000 tons of printed matter will have been distributed."

This is generally regarded as an exaggeration, since, according to the calculation of various papers, this means three or four thousand pamphlets to every man, woman and child in the United States, and would exhaust the product of all the paper mills of the country for ten years.—David B. Hill announced on his sixty-first birthday, August 29th, that he will retire from political activity and leadership on January 1st, no matter what the result of the present campaign may be, and that he will not in the event of Democratic success accept any position under the National or State Democratic administration or again become a candidate for election to any office whatever.—Victor J. Dowling has been appointed by the chairman of the State Democratic Committee to be a member of the State Executve Committee, and will have charge of the organization of the campaign in Greater New York. Since Dowling is a close personal friend of Charles F. Murphy, the leader of Tammany Hall, this is regarded as a victory for the latter in his fight against Senator McCarren, chairman of the State Executive Committee.—In Wisconsin two of the Presidential electors, Fred W. Cords and F. C. Lorenz, will ask for a hearing in a case now being brought before the Supreme Court to test the regularity of the two Republican State tickets on the ground that they were nominated by the same convention that nominated the La Follette State ticket, and if that is declared irregular the electoral ticket is also irregular. Both Cords and Lorenz were nominated by the Cook convention as well at by the La Follette convention.

The Cripple Creek Situation

Governor Peabody has taken official notice of the deportation of union attorneys and other men from Cripple Creek, and has written to Sheriff Bell that he must protect persons and property. The Governor offered to send State militia to the camp if the Sheriff is unable to maintain law and order. Sheriff Bell replied that he had the situation well in hand, and did not need the aid of troops. Notwithstanding this assurance, A. G. Le Duc, a deported member of the Western Federation of Miners, who attempted to return under the protection of a deputy sheriff, was taken from his hands at night by a mob and was run out of the district. Sheriff Bell sent a force of deputy sheriffs after the captors of Le Duc. Capiases have been placed in the hands of Sheriff Bell for twenty-eight prominent citizens of the Cripple Creek district, who are charged with conspiracy, assault to kill, false imprisonment, malicious mischief and larcency, on account of the deportations of August 20th. Among those arrested are several superintendents of mines, bankers, railroad men, four deputy sheriffs and the former Mayor and the secretary of the Citizens' Alliance of Victor. The bail is fixed at $6,500, while the dynamite suspects were released on $1,500 bail. An attempt was made to deport Hermann Herz, a clothing merchant, of Goldfield, but his son notified Sheriff Bell by telephone, with the result that the captive was released and two of the deporters captured.—Efforts are being made to get action by the Federal authorities in the Cripple Creek affairs. H. N. Heinerdinger, manager of the Intermountain Mercantile Company, has applied to the Federal Court for an injunction restraining any one in the Cripple Creek district from interfering with the operations of the store.

and has brought suits for $20,000 damages against Teller County and individuals for wrecking of the store. Ex-Governor C. S. Thomas will conduct the cases. Notwithstanding the labor difficulties, it is reported that all the industries in the camp are more prosperous than before the strike. The output of the camp is close to $2,000,000 a month and 4,000 men, none of them members of the Western Federation of Miners, are at work at the old wages of $3 to $5 for eight hours.

Strikes and Lockouts

In New York the Interborough Company and the Amalgamated Association of Street and Electric Railway Employees came to an agreement in regard to the question of priority of appointment to positions on the Subway, soon to be opened, but the motormen on the elevated roads, fearing that if the motormen on the new subway are paid $3.00 instead of $3.50 it will result in a lowering of their own wages, have made demands on the Interborough Rapid Transit Company that the subway men be paid according to the same scale as those on the elevated. Most of the motormen were members of the Brotherhoods of Locomotive Engineers and Firemen before electricity was substituted for steam on the elevated roads, and have retained their membership in these organizations, the officers of which have presented the proposed agreement to General Superintendent Bryan, of the Interborough Company. According to this, the wages for motormen now in service and others after a year's experience are to be $3.50 for a nine-hour day; any motorman having a grievance shall have the right to have it presented by a committee of the Brotherhood, and none shall be discharged without a fair and impartial hearing. According to the company a motorman in the Subway will be more sheltered and the work pleasanter. The crowd of applicants for positions on the Subway at the lower wage is so great as to block the street in front of the office.—In the strikes and lockout in building trades in New York City it is estimated that about 5 000 men have been on a strike since the third week in July, and about 25,000 since the second week in August, and that now about 27,000 men are out. The total loss of wages is not much less than $2,500.000. In general, the men have stood firm, tho about a thousand have signed individual agreements and several hundred have formed new unions in harmony with the employers' association. The marble cutters and polishers, to the number of some 1,600, declared a strike on the 25th in support of the demands of the Building Trades Alliance. Philip Weinseimer, president of the Alliance, is held for the September courts on the ground of extortion, and a second indictment has been issued against him for the same crime on complaint of Charles Tucker, who alleges that when he had the contract for the plumbing work on the Y. M. C. A. Building in Brooklyn in 1901 he was forced to pay $400 to Weinseimer, then walking delegate of the Plumbers' Union, to prevent a strike. Weinseimer admits the receipt of the money, but states it was for legitimate services.—The United Garment Workers of America, in convention at Buffalo, expelled Henry White, the former general secretary of the union, by a unanimous vote. Mr. White had been one of the most energetic in the organization of the union, and used it to threaten the manufacturers with a strike in case they carried out their proposed policy of the "open shop," but he resigned his position rather than order a strike, which he doubtless felt would be a failure, as it proved to be. He denied the charge of espousing the side of the employers and writing or instigating articles derogatory to the union. A resolution favoring socialism was voted down by a large majority of the convention.—The strike in the packing industry which begun with the butchers of Chicago, July 12th, and spread to other cities is not yet settled, but it is predicted that the strikers will return to work during the week without conditions, since the packing houses are now running to nearly their former capacity. In Chicago 18,000 men are at work, as compared with 26,444 employed a year ago, and 11,000 two weeks ago. The loss in wages is estimated at over $2,000,000, and the increased expense to the packers has been very great.

The packers secured an injunction against Mayor Harrison and the Chief of Police of Chicago restraining them from interference with the housing of non-union employees in the stock yards buildings, apparently on the ground that the buildings were not "lodging houses" within the meaning of the ordinance, and were not within the fire limits. A committee of the Chicago City Council held several meetings with the strikers and the packers alternately, but without effecting a settlement. Special Agent Stewart, of the National Department of Commerce and Labor, was admitted to the conferences. In New York the two packing plants of the "trust" are reported to have as many men as they need. The strike breakers are lodged in a passenger steamboat. Two striking butchers in New York, who overturned a meat wagon driven by a non-union man, were arrested and indicted on the charge of rioting. This is a more serious charge than that of disorderly conduct and no indictments have been issued for this crime since 1893. The packers in South Omaha asked to have Federal troops sent to protect their workmen and property. The funeral procession of the child of a carpenter, who remained at work in one of the packing plants, was attacked by a mob of 200 strikers and sympathizers in South Omaha. Bricks were thrown at the hearse, and the deputies had difficulty in clearing the streets. In Chicago eight girl strikers attacked a girl who was working at the Libby plant, as she was going home on a street car, and dragged her to the ground, where they "slugged" her in the head while the men bystanders cheered them on. Another of the riot victims has died from his wounds, and two others are dangerously hurt.

What the Free Church Will Do

If one could judge from a sermon by the Rev. Murdo M'Queen, Moderator of the Free Church of Scotland, the little remnant of that Church which refused to join the United Church, and which has now obtained all its millions of property by the decision of the House of Lords, will show no mercy. Mr. M'Queen is thus reported:

"In my college days, I heard Dr. Begg say, 'Thank God for the House of Lords.' From the bottom of my heart I echo the saying. I now see that the professors of the United Free Church are already beginning to roar and shriek and yell, and why? Is it because the doctrines of the Confession of Faith are undermined, or because the Word of God has been mutilated? No, but because they have lost every penny of their salaries. It is neither just nor right to divert these funds to the propagation of error and falsehood, and all that is in opposition to the Word of God and Confession of Faith. It is wasting pity to extend it to these men who, if they had the power, would crush us under their heel. The millions have been restored to the Free Church, and the verdict of the House of Lords cannot be reversed. notwithstanding all the bellowing and roaring and shrieking of the United Free Church body. 'Are you willing to give us a share?' they ask. Were the United Free Church willing to give us a share? Did they not shut the Free Church out? I said no; we cannot give them a share. The Free Church cannot part with one shilling of its funds, or a stick or stone of its property, because it has been given to the Free Church, and it is to be expended and used for Free Church purposes, and it would be stealing to give away those funds to the body that has left the Free Church. I do not call the majority a Church. It is a political ecclesiastical caucus. It is Noah's Ark full of clean and unclean animals, with the unclean element predominating, with the lower animals sinking low in the water and about to disappear in the waves. I call them—let them be pleased or not, it does not matter—a feather's weight. The Moderator of the United Free Church, speaking at Forres, has referred to the decision as a calamity. I do not deny that it may be a calamity. But I say this, that they have brought upon themselves the righteous retribution of the Most High for their unfaithfulness to God. I have held for years that it would be well to get rid of these principals and professors, and we have got rid of them, and a good riddance they are for the Free Church cause and the Free Church of Scotland. It would be wasted sympathy to waste it upon them. The Free Church has to bless the Lord for his great deliverance this day."

With this agrees the Commission of that Church which unanimously adopted resolutions requiring the United Free Church to turn over all the former Free Church property, assembly hall, library, colleges, churches, manses and funds, altho conditions of use might be allowed for a while. These conditions, in the case of colleges, churches and missions, provide that none of the new heresies as to Voluntaryism or Arminianism be taught, the same condition applying to missions at home and abroad. Of course, the ma-

jority, led by Professor Rainy, refuse to yield their principles for mere money. Meanwhile the Archbishop of Canterbury, who is himself a Scotchman, has offered, with some other men of distinction, such as Lord Rosebery and the Earl of Aberdeen, to act as intermediary between the two parties, but there is as yet no indication that the "Wee Free," or "Wee Kirkers," as they are called, will think it right to make any compromise. Also the majority will hesitate, as they are now believers in Voluntaryism, while the victorious remnant wish to cling to the principle of Establishment and are inclined to consider joining the Established Church of Scotland; and the Archbishop and Balfour belong to an Established Church. The communication of the lawyers of the "Wee Free" thus reads:

"The parties are no longer in the region of litigation where compromise might have been possible and expedient, but . . . have been irrevocably adjudged the trustees or beneficiaries of the trusts in question. Our clients conceive that they must, to the best of their ability, administer the property under the conditions of the trust, and we think no good can come of a conference unless your clients are prepared to accept the situation. . . . There should be an honorable understanding that the premises to be granted [colleges, etc.] should not be used by your clients for the purpose of attacks on the trust."

Under the "trust" they mean the doctrines protected by the decision of the House of Lords, the principle of Establishment and high Calvinism. It has been said that there are only 24 ministers that stayed out of the union, but one of the body, or their counsel, claims 37 ministers, 105 congregations, and about 50,000 adherents (not members). The 107 congregations must be mostly remnants, for the vote which accepted union with the United Church of Scotland stood 643 against 27.

The British at Lhasa

Colonel Younghusband finds his position at the capital of Tibet a somewhat embarrassing one, for, altho he is unmolested, there is no way at present apparent by which he can accomplish the object of the mission—that is, the negotiation of a treaty with Tibet settling the questions of boundaries and trade relations with India. The Dalai Lama is supposed to be in some monastery not far away watching events, but shows no disposition to return to Lhasa, and it is obviously impossible to find him. No one is willing to assume any authority to treat with the English, altho it is reported that the seal was left in the palace, and the Dalai Lama before his departure appointed a regent. The Amban, the Chinese Ambassador to Tibet, exchanges friendly visits with Colonel Younghusband, but he appears to be practically destitute of power, and even of influence with the Dalai Lama. Snow is already falling on the passes and the mountains near the plain of Lhasa, and it will not be long before winter sets in and the transportation of supplies from India becomes impossble. Yet to withdraw the mission now without accomplishing its purpose would destroy all its effect. Colonel Younghusband's threat that an indemnity for the expense of the expedition is one of the conditions of its withdrawal, and that the amount of this indemnity was increasing each day that the expedition was delayed, seems to have made no impression. A market has been established near the camp, and the natives are reported to be very willing to sell supplies to the invaders. None of the palaces or monasteries of Lhasa has been entered by the English.

The Christening of the Czarovitch

On August 11th, according to the Julian calendar, still used in Russia, or August 24th as we reckon time, the heir to the Russian throne was christened Alexis Nicholaevitch by the Metropolitan of St. Petersburg in the chapel of the Peterhof palace. The infant lay still while he was anointed with holy oil on the hands, breast and head, but gave evidence of his vitality and lung power by a lusty yell as he was immersed in the jeweled font. At the sound of the Te Deum by the choir behind the gilded screen the bells rang and the imperial yacht saluted with 301 guns. As the news spread the bells and guns of other cities sounded forth until from the Atlantic to the Pacific every part of the vast empire rejoiced in the birth of him who is appointed to rule over them. According to the Russian custom the Czar

was not present at the ceremony, but accompanied his son to and from the church, followed by a procession of the representatives of the royal sponsors, the grand dukes and duchesses and an escort of the Blue Cossacks of the Don, of which the child is now ataman. The Czar issued a manifesto of which the most important provision is the abolition of corporal punishment for the peasants and the restriction of its use in the army and navy. The *Russ* rejoices that "No longer will it be possible to stigmatize Russia as the Land of the Knout," and the *Novoe Vremya* says the reform in the method of punishment in the army and navy is a right and proper recognition of the heroism displayed by the men in the Far East. The sentences of ordinary convicts are reduced one-half and life sentences are cut to 14 years. All prisoners arrested for minor offenses and not yet sentenced are pardoned. In regard to political prisoners, the manifesto reads:

"Political prisoners who have distinguished themselves by good conduct may, on the interposition of the Minister of Justice, obtain the restitution of their civil rights at the expiration of their sentences.

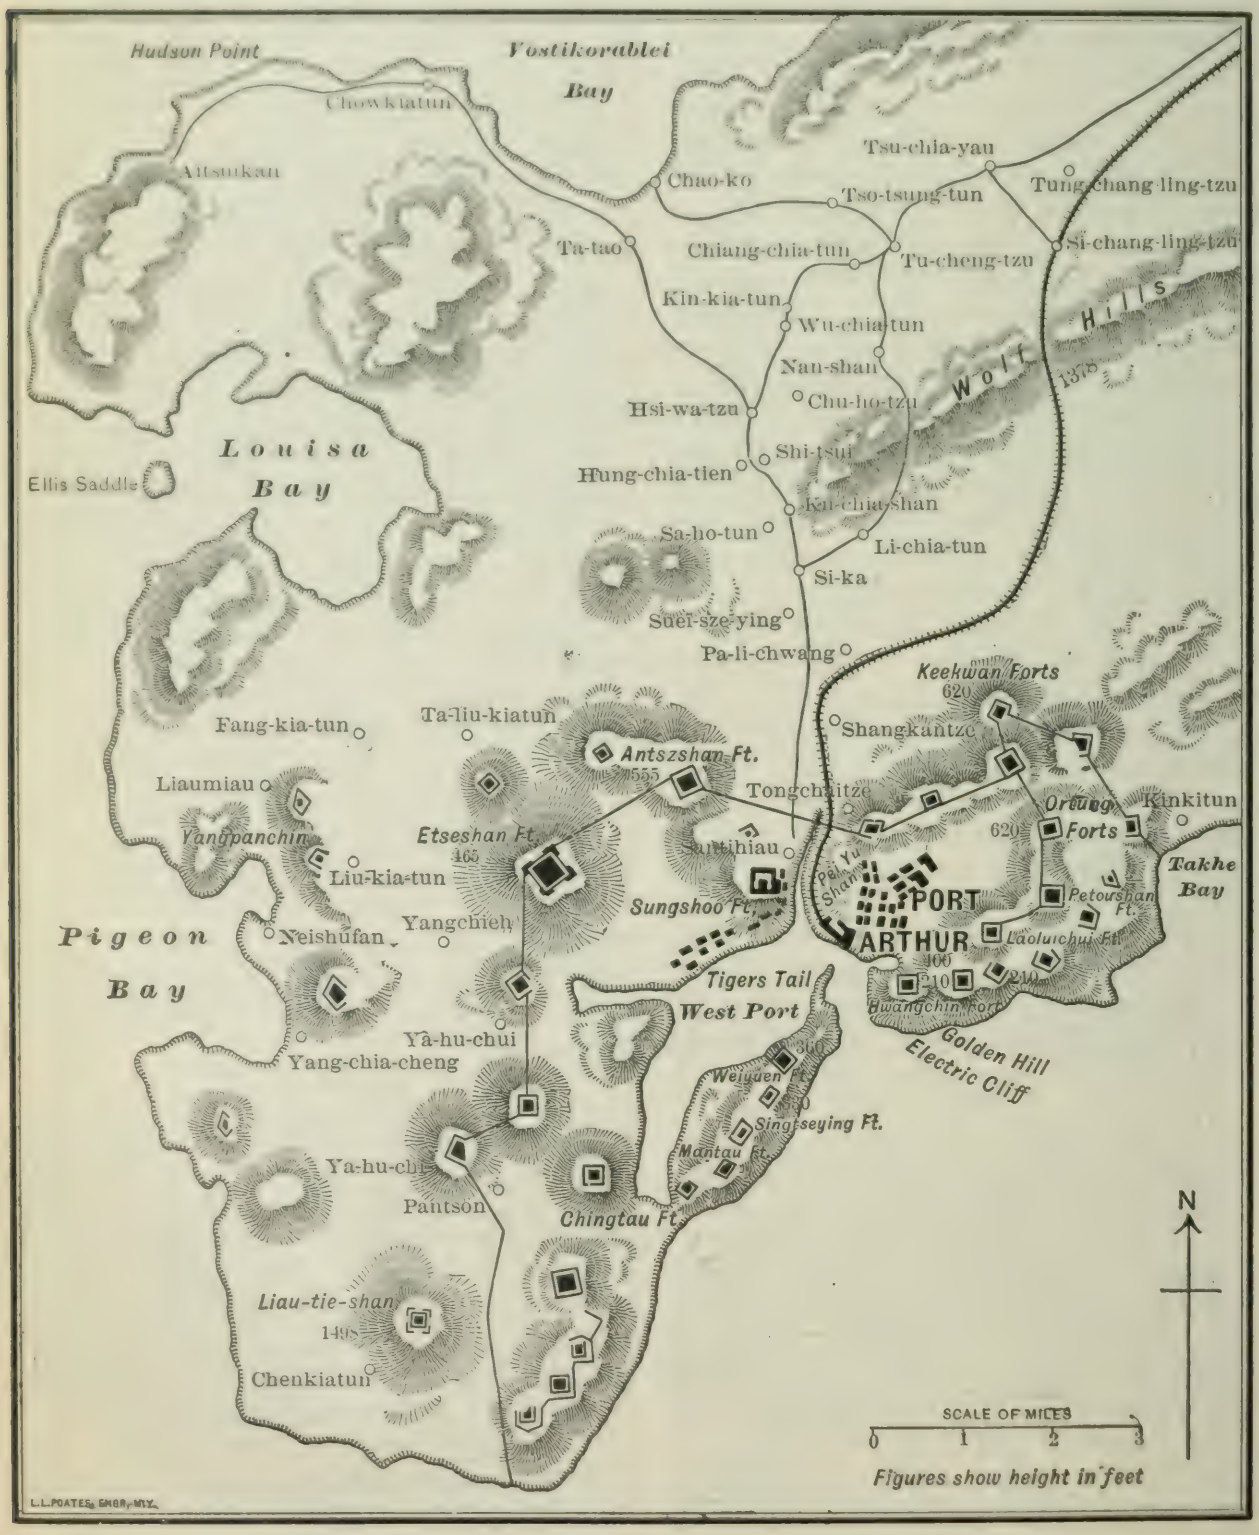
"Persons guilty of political offenses committed within the last fifteen years who have remained unidentified will no longer be subject to prosecution, while political offenders who are now fugitives abroad may apply to the Minister of the Interior for permission to return to Russia."

The fines imposed on Jewish communes on account of Jews avoiding military conscription are remitted. Arrears due the state for the purchase of land for the serfs are remitted. A number of provisions relate to Finland. All fines imposed on villages and communes of Finland for failure to elect representatives to serve on the military recruiting boards for 1902-1903 are remitted. Finns who have left their country without permission of the authorities may return within a year, provided they present themselves immediately for military service if they are liable to that duty. The Governor-General of Finland is directed to consider what steps can be taken to alleviate the lot of those who are forbidden to reside in Finland. A sum of $1,500,000 is set apart to be spent for the benefit of the landless people of Finland. The Finnish military district is abolished, and the Grand Duchy is to be incorporated with the St. Petersburg district. It will be seen that no very sweeping amnesty or such important reforms as had been freely predicted are included. The unhappy lot of Finland in particular is not relieved. On the contrary, another blow to the independence of that country is inflicted by the incorporation of their army with the Russians. The fund for the relief of the landless class, to which addition is now made, was established by the late Governor-General Bobrikoff for the purpose, as the Finns assert, of securing the support of the poorer peasants by setting their interests in opposition to the national aspirations of the higher classes. Since the money donated by the manifesto is to be raised by taxation in Finland and expended in what the Finnish leaders consider bribery, the Czar is not credited with much generosity. It will be seen that the promises made to the banished Finns and political offenders generally are very vague, and there is no material alleviation of the condition of the Jews. The remittance of money which the communes have not been able to pay in the forty years since the freeing of the serfs does not amount to as much as it seems.

The Russian Navy

The Japanese Admiral reports that three Russian vessels have suffered from floating mines outside of Port Arthur. The battle ship "Sevastopol," on the 23d, struck a mine in passing out of the port and listed to the starboard. She was towed back into the harbor. On the following day two torpedo boat destroyers, engaged in clearing away the mines two miles south of Liau-tie-shan exploded mines, and one of the destroyers was sunk and the other had to be towed in.—In the harbor of Shanghai the Russian cruiser "Askold" and the destroyer "Grozovoi" have gone out of commission, and their flags are not raised. The "Askold" is allowed to remain in dock until September 11th to finish repairs. The crews will be paroled and allowed to return to Russia. The Shanghai newspapers unanimously regard this satisfactory settlement of the difficulty as due largely to the diplomacy

and tact of the American Consul, John Goodnow, dean of the Consular Corps. —The Russian cruiser "Diana" at Saigon is so far neither disarmed nor repaired. She has a shell hole below her water line.—The British Naval Court of Inquiry, sitting at Shanghai, in the case of the British steamer "Hipsang," which was torpedoed and sunk on July 15th while passing Pigeon Bay, report that the steamer had no contraband on board, that she was on her correct course and flying British colors, and that the action of the Russian destroyer in shelling and torpedoing her had no justification. Russia will be asked to pay an indemnity.—The Russian auxiliary cruiser "Smolensk," one of the vessels which recently passed the Dardanelles under a merchant flag, stopped and searched the British steamer "Comedian," off the southeast coast of Cape Colony. Premier Balfour made a vigorous protest against the use of these ships as men-of-war, and in reply the Russian Government stated that orders had been issued to stop the searching of neutral vessels, but that it had not been possible yet to convey these orders to the commander of the "Smolensk." The British Government has expressed a willingness to convey such orders to the Russian ships.—The Baltic fleet sailed from Cronstadt on the night of the 25th on a cruise which may be extended to the Far East. The fleet consists of the battle ships "Souvaroff" (flagship), "Borodino," "Alexander III," "Oslabja" and "Orel," the cruisers "Dmitri Donskoi," "Aurora," "Zentchug," "Izumrud" and "Almaz," and the transports "Okean" and "Kamtchatka," with a number of destroyers.



Closing in on Liao-Yang

The Japanese have renewed their activity in the north and there was heavy fighting to the east and south of Liao-Yang on August 25th and the following days. According to the latest estimates General Kuroki on the east has 100,000 men, General Nodzu on the southeast has 70,000, General Oku on the south has 40,000 and a fourth army of two divisions, numbering some 30,000 altogether, is going at the right bank of the Liao River from Niuchwang to attack the Russians from the west. A simultaneous attack was made on the Russian left and center. In the former of these movements the Russian positions in the vicinity of Lian-Dian-Sian and Anping, between 10 and 15 miles southeast of Liao-Yang, were attacked by General Kuroki from the east, and, according to the Russian reports, he was repulsed with heavy losses. The Russians lost 1,450 men, killed and wounded, in the valley of the Lan, a small tributary of the Taitse River, where nine batteries of six guns each bombarded the Russian outposts, resulting finally in fierce hand to hand fighting. At the same time General Oku advanced up the railroad from the south toward An-Shan-Chan, driving in the Russian outposts with a loss of 150 men. On the 26th, at 5.30 a.m., the cannonading began and continued till afternoon, when the Japanese infantry attacked all along the line. The Russians claim to have repulsed all attacks, tho a loss of over a thousand men is admitted. On the 28th the troops about An-Shan-Chan were ordered to fall back to Liao-Yang. The retreat was accomplished in an orderly manner, notwithstanding that the heavy rains had filled the valleys with mud, through which the artillery was dragged with great difficulty. In the retreat of the left wing to Liao-Yang six guns had to be abandoned, after disabling, on account of the muddy roads. It is uncertain whether General Kuropatkin will attempt to hold Liao-Yang, or will withdraw toward Mukden, for fear that General Kuroki will cut the railroad to the north by throwing a part of his force across the Taitse River.

The Siege of Port Arthur

There has been continuous fighting on the Kwang-Tung peninsula about Port Arthur during the week, but very little is definitely known of the results. From Russian sources there are reports of a succession of furious assaults on the fortifications, in which the Japanese were invariably repulsed with the loss of several thousand men. Nevertheless the Japanese have been successful in carrying, tho apparently not in holding, some

of the main line of forts. Among these is Etseshan (or Itse Hill) Fort, from which the Russians were driven by heavy artillery fire. The Japanese were not able to place guns here, since it is covered by the neighboring forts of the chain, but they raised the summit of a small hill behind it to the level of Etseshan by means of sand bags and mounted guns there. According to the Associated Press dispatches from Che-Foo Etseshan is east of the railroad and north of Port Arthur, but in the accompanying map we have followed the plans and descriptions of the fortifications as given in the London *Times*, in locating it to the west. In a night attack on August 22d the Japanese captured Poyodo, a fort just outside the eastern defenses. Lieutenant McCully, of the American Navy, who has been in Port Arthur for three months and is now at the Russian headquarters at Liao-Yang, is reported as saying that the fortress is well supplied with food and ammunition and may hold out three months longer.

Humble Pie

BY MARY E. WILKINS FREEMAN

Author of "The Portion of Labor," Etc.

THERE are some people who never during their whole lives awake to a consciousness of themselves, as they are recognized by others; there are some who awake too early, to their undoing, and the flimsiness of their characters; there are some who awake late with a shock, which does not dethrone them from their individuality, but causes them agony, and is possibly for their benefit. Maria Gorham was one of the last, and for the first time in her life she saw herself reflected mercilessly in the eyes of her kind one summer in a great mountain hotel. She had never been aware that she was more conceited than others, that she had had on the whole a better opinion of her external advantages at least, than she deserved, but she discovered that her self-conceit had been something which looked to her monstrous and insufferable. She saw that she was not on the surface what she had always thought herself to be, and she saw that the surface has always its influence on the depths.

Maria Gorham was an old young woman in her early thirties. She had taught school in her native village in one of the New England States since she was seventeen. She had been left quite alone in the world, five years before, when her mother died. She lived entirely alone in the house in which she had been born. It was one of the cottages prevalent in certain localities. She was entirely fearless. So quietly poised was she in her own self esteem that it had never occurred to her that anybody could possibly have any ill will, or even any uncomplimentary feeling, toward her. She had always heard herself called good-looking, and it had not occurred to her to doubt the opinion of others. She had also heard herself called industrious, capable and more than ordinarily clever, and she acquiesced with that opinion also. She had also heard her taste in dress extolled, and she had packed her little trunk with entire confidence. Dexter Ray's sister Emma had run across the street, and was watching her. "I thought I'd like to see you put all them pretty things in, I suspected you was packin'," said Emma, with a gentle admiration, and not a suspicion of jealousy. Maria noted Emma's faulty English with a superiority which gave her a certain pleasure. "Poor Emma," she thought, and replied all the more sweetly. "Yes," said she, "I am going on the eight o'clock train to-morrow morning, and I must have my trunk all ready to-night."

Emma watched Maria fold her blue foulard gown daintily. "Well," she said, "I guess there won't be many to that hotel where you are goin' that has any prettier things than you."

Maria laughed. "Nonsense," she replied, but in her heart she quite agreed with Emma. She had entire faith in her wardrobe, which she and the village dressmaker had prepared.

"I suppose you'll wear that handsome pink wrapper mornin's," said Emma.

"Yes, I have planned to," replied Maria. Just as she spoke there was a ring at the front door bell, and Emma started and blushed, altho she had herself nothing for which to blush. "I rather guess that must be Dexter," said she.

Maria frowned.

"Dexter said he guessed mebbe he'd jest run in an' say good-by," said Emma, timidly, and with even more embarrassment.

Maria herself blushed, but, as it seemed, with anger rather than embarrassment. However, she tried to speak politely. Dexter Ray was the only man who had ever wanted to marry her, and while she thought herself too good for

him, she considered that he was to be rewarded at least with politeness for his pretensions.

"I really don't see how I can stop my packing," she said, "I wonder if you wouldn't just run down stairs and tell your brother that I am real sorry, but I am packing."

Emma stood up with dignity. She had at times a little sense of injury on her brother's account. "All right," said she.

"I have been working very hard all day finishing up some sewing and getting the house ready to leave, and, if I stop now, I don't know when I would get to bed," Maria added, with more conciliation in her tone.

"All right," said Emma, and went out. Maria heard her tell Dexter. "She's says she's real sorry, but she's awful tired, she's been workin' so hard all day, and she's got to get her trunk packed to-night." There was more sorrow in Emma's voice than there had been in Maria's. Maria stole a glance out of the window, and saw Dexter going meekly down the path between the flowering shrubs after his rebuff. He was quite a tall man, a little older than she, and there was an odd faithful bend in his shoulders. Maria sighed, she could not have told why. Sometimes she wished that Dexter had been a more fitting match for her.

Sometimes she had actually felt angry with Dexter Ray that he did not try to make more of himself, but he spoke no better English than his sister. He also, in her opinion, had no ambition. He kept the village drug store, and several times he had had an opportunity to be selectman, and once town clerk, but he seemed to have no interest except in measuring out drugs and dispensing soda water. It would have puzzled Maria had she been required to mention by what right in view of her own antecedents she regarded herself as on a higher social scale than Dexter Ray. Her father had been a small farmer, and his father before him. On her father's death she had sold all the farming land, and that made her little nest egg in the savings bank. She had never saved much from the money which she earned teaching. She had a weakness for pretty things, both for her own person and for her house. She had had a bay window and a piazza put on the house since her father's death. She had also a very splendid carpet in the parlor and a set of plush furniture. She had never traveled. There was in the depths of her soul a feminine timidity about setting forth alone on strange paths, in spite of her steady egotism. It was almost as if she feared lest her faith in herself would desert her, if she were deprived of the accustomed support of admiring friends and subjected to the cold scrutiny of strangers. However, nothing could have made her admit the slightest hesitation, and the next day she was to set out alone to spend a whole month at a great mountain hotel. "I declare," Emma Ray said, when she returned. "I should think you'd sort of dread startin' out all alone to-morrer, Maria."

"I don't know why," replied Maria, calmly.

"I should think you'd sort of dread goin' into the dinin'-room all alone."

"I don't know why."

"Of course, I know you'll look as fine as anybody," said Emma in a conciliatory tone.

"I don't know why I should dread it, however I looked. This is a free country."

"I suppose there's a lot of rich folks at that hotel."

"Well, riches don't make any difference in a country like this, do they?"

"I don't know," replied Emma.

"They ought not to, anyway," said Maria, firmly, substituting the principle for the fact with a fairly great loyalty.

"Mebbe they don't," said Emma.

Presently Emma added. "Of course, it ain't as tho you wasn't educated. Of course, you have been school-teachin' all your life, and I s'pose lots of them rich folks couldn't teach school any more than they could fly."

"They haven't been obliged to," replied Maria.

"They couldn't, anyway."

Maria made no dissent to that. In her heart she agreed with Emma. She folded carefully a white lawn sacque trimmed with frills of embroidery, and laid it in one of the top trays of her trunk.

"That will be real pretty to wear with your black silk skirt," said Emma.

"Yes, I thought it would," said Maria.

Mary E. Wilkins Freeman, Author of "The Givers," etc. Copyrighted, 1904, by Harper & Bros.

"It looks as if you might have a dreadful hot day to-morrow," said Emma, glancing out of the window which faced the west. The sun was setting like an awful ball of fire for the ultimate consumption of the world.

"Yes, it seems as if it might be hot," assented Maria.

"What are you going to wear travelin'? You'll have quite a long journey, most nine hours, Dexter said. He studied it out on the time table."

"I'm going to wear my gray mohair I had last summer."

"Well, that sheds the dust fine."

"Yes, and I'm going to put my black silk skirt in the top of the trunk where I can get at it easy, and put it on with this cambric sacque to go to supper in, if it's a warm night," said Maria.

"That will be a real good idea," said Emma, approvingly. "It won't be so much work as getting into a dress, and you'll feel tired."

"That's what I thought. I'll wear this cambric sacque to supper, and then I suppose I shall sit in the parlor and listen to the music. They say there's music and dancing every night."

"Well, there ought to be something when they ask such prices."

"Yes, that is so," replied Maria. She

was herself secretly dazed at the wild extravagance into which she was about to launch, but a spirit of defiance had suddenly seized her. It was a hot electric summer, prone to burst forth in fierce storms, and Maria, in spite of her great self poise, had an irritable, high-strung nervous temperament. All at once it had seemed to her that she could no longer remain where she was and go her daily rounds. She hated the very sight of all the old articles of furniture, which had heretofore been to her almost like members of her family. She had acquired the habit of sitting in the front parlor, a room which had never been used unless there was company in the house. She also slept in the front chamber instead of her own for weeks. From these rooms she could look across the street and see Dexter Ray coming and going, and sometimes she was conscious of a distinct anger against fate which had not provided her with a better lover. She had an unacknowledged humiliation because of her single estate. She was afraid that people would think nobody had ever wanted to marry her. She took a pleasure of which she was ashamed in having Emma Ray run in often and in her apparently unappreciated hints concerning her brother. Emma had been almost aghast when Maria told her of her resolution to go to the mountains and spend a month.

"Why don't you wait and go on one of them fifteen-dollar excursions?" said she. "There will be time enough before your school begins."

"I am not going with a rabble. I would rather stay at home," replied Maria, firmly.

"But it must cost an awful sight at that hotel."

"I don't care. I'm going to take the money out of the bank, and I am going. I need a change. I have been getting nervous lately, and, if I go at all, I am going the way I want to go. I don't care if it does cost. I have made up my mind."

Dexter was almost as much aghast as his sister when she told him of the proposed flitting, but after a minute he said: "Well, I guess she's right. She'd better go the way that's a-goin' to do her good, if she goes at all. I'm glad she's goin' to have a little vacation. She has worked hard all her life." The expression of Dexter Ray's face as he said that was gentle, almost noble. The tears sprang into his sister's eyes. "I don't know as she has worked any harder than lots of other folks," said she, and she spoke almost crossly to cover her pity for her brother. "Go right up an' down the street here," she added. "How many women or men have ever had a real vacation?"

"That don't alter it any," replied Dexter, still with the same gentle, noble expression. "I'm real glad *she's* goin' to have one, anyway." The emphasis which he put upon the she was like a benediction. It almost transfigured the face of the man, which was homely with a commonplace homliness. He was a good druggist, and the village people held him, after all, in esteem, altho he had always been, in a measure, a butt, because of his awkwardness and shyness. He stumbled on all the thresholds of social intercourse with his kind, but he never made an error in putting up a prescription. The night they were talking about Maria's going away he proposed timidly to his sister that perhaps Maria would like to have him carry her to the railroad station in his buggy. "There'd be plenty of room in front for her trunk tipped up on end, and it would save her fifty cents," he said.

"Land, she'd turn up her nose at the bare idea," replied Emma.

"Well, maybe she would ruther have the stage come for her," returned Dexter, meekly. "I was only thinkin' of savin' her some money."

"It would make no end of talk," Emma said, with more leniency toward Maria.

"Well, I s'pose you are right," responded Dexter, with a sigh.

However, Emma was so sorry for him that the night before Maria left, when the trunk was packed, and she was about to go home across the street, she said, timidly, "I s'pose you've got the stage ordered to take you to the station in the mornin'."

"Of course," replied Maria. "It isn't very likely I would leave that until after nine o'clock at night, when the train left in the morning." She spoke with some

asperity. She seemed to have a glimpse of Emma's meaning in putting the question, "Why?" she demanded further.

"Nothin'," replied Emma, meekly. She felt cowed, and as if she had done her brother's cause great harm. "Only——"

"Only what?"

"Oh, it wasn't nothin', only Dexter, he said he'd jest as lief take you and your trunk down to the train, and save you the expense."

Maria's face flushed. "Well, I rather think I wouldn't go down to the station with Dexter Ray right in the face an' eyes of all the people, with my trunk tilted up in front," said she. "I should think your brother would have known better than to propose such a thing."

Emma Ray was almost in tears. She was capable of evanescent spurts of assertion, especially on her brother's account, but she was easily intimidated, especially by Maria, to whom she looked up with the greatest admiration and love. However, she also loved her brother, and she made a feeble feint in his defense. "He didn't mean nothin' but kindness," she said, and Maria's heart smote her.

"Oh, I know it!" she replied, "and I'm much obliged to him, but you know, Emma, yourself, it wouldn't do."

"Maybe it wouldn't," said Emma, "but Dexter he didn't think of that. Men ain't apt to. He jest meant to be kind, and save you expense." There was something almost piteous in her tone.

"Well," said Maria, "when I started out planning this trip I made up my mind to spend some money, and not worry about the expense, but I'm just as much obliged to your brother." Maria always said, "your brother" instead of Dexter.

That night after she had gone to bed she thought about it all, and she felt almost angry again with fate, or with Dexter himself, she could scarcely have told which, that the one man who had fallen in love with her had been Dexter Ray and not some one whom she could consider as her equal, and who spoke better English. The position, socially speaking, she did not think of at all. A druggist was as good as anybody in her little village; in fact, it was considered a decidedly genteel calling. It was only Dexter's own personal drawbacks which she considered.

The next morning she started on her trip, and a queer little qualm of something like self-pity smote her when she saw one of the village women being driven to the station by her husband in his buggy, with a small trunk tilted up in front. She herself clambered out of the village stage coach, which was a relic preserved with pride, and she tripped a little and a bit of the braid ripped off the hem of her gray mohair. She was obliged to pin it up when she got on the train. The thought came to her that a woman was better off with a husband to take her to the station, and assist her out, and check her baggage. Then she straightened herself, and realized with pride that she was going to the mountains to stay a month in a great hotel at an enormous price, and the other woman was only going to pay a visit to her sister in Maine, and going on an excursion at that. It was almost dark when Maria arrived at her destination, then she had a drive of a mile through the woods, which rose and sank and beetled on mountain sides. The air was cooler, and she was conscious of a strange vigor in it. She rode in a mountain wagon which was filled with passengers, altho Maria could not remember seeing one of them on the train. They had all been on Pullman coaches. It had never occurred to Maria to take a Pullman coach. On the seat with Maria was a corpulent woman in a long black silk traveling cloak, and a hat draped with a chiffon veil. She cast one glance at Maria, then looked away, and it was as if she had not seen her at all. With this woman were her two young daughters in tailor-made suits and a young son carrying golf sticks. The two daughters were nearly of an age, and very pretty with pert tilts to their chins, and they carried themselves like princesses. They talked but little, but what they said was as the language of an unknown world to Maria. Both of the girls glanced at Maria very much as their mother had done, only they gave each other an almost imperceptible glance of amusement afterward. Maria wondered why. She caught the glance, as any self-centered person would have done. She shortly afterward raised her

hands and straightened her bonnet. She wore a bonnet with strings tied under the chin, altho she was not nearly so old as the girls' mother. She also wore a nice little brown and white checked shawl over her shoulders. The shawl had belonged to her mother, and Maria always used it for an extra wrap on a journey, without a thought that its day as regarded fashion has passed. When she had seated herself in the mountain wagon she put the shawl over her shoulders and sat up straight with her school teacher air, which was almost majestic. She did not dream that the combination of majesty, and little checked shawl, and bonnet, and face, which was almost too young for such head gear, could possibly afford any amusement to the girls beside her. When she heard a soft subdued chuckle she did not dream that she was the cause of it. "Two silly girls," she said to herself, and eyed the mountains, and realized her own superiority, inasmuch as she was intent upon those majestic slopes, while the girls were chattering over their own petty little affairs. She made up her mind that she would write Emma Ray while she was away, it would please her so much, and she thought of a fine sentiment to put in the letter. She would say that she had never realized her own littleness so much as when she had her first glimpse of the mountains, and she did not know that in reality she realized her own superiority instead of her littleness. They reached the hotel, and she was shown to her room. She felt a slight inward tremor, because she had never been in a hotel before, but she fairly strutted across the office, holding her bonneted head high, with her little checked shawl still over her shoulders. And she carried out her intention of slipping on her black silk skirt and her white cambric sacque, in which to appear at supper. But for the first time in her life Maria Gorham had an awed sensation as she saw the other women sweep into the dining-room in evening gowns. She looked around furtively, and she saw not another woman in a sacque. But she was not easily daunted, not even when some other ladies in low neck gowns seated themselves at her table, and she saw them looking askance at her sacque.

She ordered her supper with dignity, and ate it, and when she had finished she marched stiffly the whole length of the dining-room. They had placed her at a table at the extreme end. She heard furtive chuckles, but she did not admit that they were laughing at her, Maria Gorham, and that she did not still believe in her sacque and its entire appropriateness to the occasion, and she would not weaken. She went into the music-room, and seated herself composedly and listened to the orchestra and watched the young people dance. When at last she went up to her room, and divested herself of the sacque, she did not own that she would not wear it again to supper while she was in the hotel. Instead she hung it up carefully with a little defiant air, under the cretonne curtain which served in lieu of a closet on one side of the room. "I don't care what other folks wear, I rather think I have a right to wear anything I choose which is tidy and comfortable," she told herself. The next morning she attired herself in the pink wrapper and went down to breakfast, and she was soon aware that not another woman in the dining-room wore a wrapper. She became aware that furtive fun was made of her. The people in the hotel were, on the whole, a well bred and good-natured lot, and were incapable of downright ridicule. But now Maria Gorham's spirit was up. Out on the verandah she went and walked up and down holding up her wrapper daintily. Then she sat down in one of the verandah chairs, and watched people pass her with furtive stares at her wrapper, and she felt fairly warlike. She said to herself that she would not persist in wearing the white cambric sacque to supper, since she had not planned that, altho if there came a warm night when she did not feel like putting on a tight dress she would wear it, but as for the wrapper she would not give in one whit. It was a pretty wrapper, and nicely made, trimly belted with a pink ribbon. She had intended to wear it mornings during her stay at the hotel, and she would wear it. And she did, but as the time went on she suffered tortures. Ridicule was the hardest thing in the world for one of her kind to endure. Open warfare would have been more to her liking, but ridicule it was that she

had to prepare herself for every morning, and ridicule the worse because it was covert and could not be met with open resentment. Several times in the evening when she was wearing one of her best dresses, which somehow seemed not so fine as she had thought them, she heard herself alluded to as the woman who wore the wrapper mornings. She knew that was the name she went by, but the more she suffered the more obstinate she grew. She walked the verandah in her wrapper. She even climbed a mountain, a small one, marching to the summit as grimly and unflinchingly as the youth in "Excelsior," holding up the wrapper carefully above her starched petticoat. She wore on that expedition her little bonnet with a small black lace veil, and the black flies crawled under the veil and bit her cruelly. The next day her face was so swollen that she was obliged to call in the hotel physician, and it was on that day that Mrs. Evans came in the afternoon. There was a gentle knock at Maria's door, and Maria said, "Come in," and a woman as gentle as the knock entered, and asked if she could not do something for her. She had heard that she was ill. Maria answered her gratefully at first, then she caught a swift glance of the other woman's eye at the pink wrapper, a fold of which obtruded from behind the calico curtain, and she understood that this woman, sweet and gentle and kind-hearted as she was, had looked upon her in the wrapper as the others had. Then she spoke grimly, altho grimness only lent renewed absurdity to her distorted face. "There is nothing you can do, thank you," she said. "I have had medical advice. The "medical advice" alone would have proclaimed her the school teacher. The other woman was rather persistent in her kindness, she offered to read to her, but Maria refused more and more brusquely. The woman went away, but soon she sent by a bell boy a plate of grapes, having selected the choicest from some which had been sent to her from New York. "Now, she'll be coming again," Maria said to herself, and she was right. Next day Maria was better, still her face was too badly swollen for her to leave her room, and the woman came again. Even after she had quite recovered Maria was liable to a call from her, altho she never encouraged it. In fact, the woman, who had an obtrusively benevolent heart, had set herself the task of quietly leading up to the wrapper. She had talked it over with some other ladies, and they had agreed that it was a shame that a woman as good as Maria seemed to be should make herself so ridiculous. But the other ladies had not the spirit of this one. "I am going to tell her," said she, and she did about a week after she had first spoken to her. The woman was calling upon Maria one morning and Maria was wearing the wrapper, and the woman spoke out with exceeding sweetness, which still had a sting in it. "What a lovely wrapper that is you are wearing," said the woman.

Maria's face changed. She looked at her suspiciously, altho she answered with dignity. "Thank you!" she said.

"What a pity it is that wrappers, no matter how pretty they are, are not worn in large hotels," said the woman. Then her face colored piteously before the indignation in Maria's. "It does not make the slightest difference to me what is worn in hotels, or is not worn in hotels," said Maria, sternly. "I wear whatever I please as long as it is tidy and respectable."

Tears actually sprang into the other woman's eyes. "Oh, dear, I am so sorry you take it so!" said she. "I meant well. It was only because I hated to have——" She paused.

"Hated to have what?" asked Maria, pitilessly.

"Hated to have you made fun of," almost sobbed the other woman.

"If I am not made fun of for anything worse than wearing a wrapper in the morning, it does not worry me at all, not at all," said Maria, with her head up in the air.

The other woman rose. "Well, I meant it kindly, and I am going away in the morning," said she.

"Oh, I am not at all offended!" said Maria, in a somewhat softer voice, "and I thank you for your interest, but I do not allow even my dearest friends to interfere in matters so purely personal as my attire."

The next morning Maria in her wrapper shook hands with the other woman,

as she went out of the hotel on her way to the train. "I do hope you don't lay up anything against me," said the other woman.

"Not at all," said Maria, briskly and kindly. Then the woman went her way. She was the only one of the guests who had spoken to Maria, and she had been in the hotel two weeks. Nobody at all spoke to her during the remaining two weeks of her stay. Maria was, on the whole, more lonely than she had ever been in her life, and she did more thinking. She thought a good deal about Dexter Ray. She thought how if she had a husband with her like many of the other women she would not have felt so defenseless and isolated in her wrapper, which she had begun to regard as a matter of principle. She felt sure that Dexter would admire the wrapper. She could see just the kindly, worshipful expression that would come into his brown eyes at the sight of her in it. She recalled how Emma had believed in the wrapper. She began to reflect as she had never done on the pettiness and worthlessness of externals. She wished she could see Emma, and hear her talk in her bad English. She began to understand that the bad English might be very much like the wrapper, something beneath a loving soul to notice, if the heart of the speaker were right. She remembered how very plain Dexter Ray was, and how clumsy, and how he talked just as Emma did, and it all seemed to her like the wrapper and the cambric sacque, something for people who had not love and appreciation in their hearts to make fun of, but nothing of any consequence to those who could see what was underneath; the honesty, and the affection, and the faithfulness. Two days before Maria went home she wrote to Emma Ray, and told her when she was coming, and asked her and her brother to come in and spend the next evening with her. Maria was pale when she posted the letter in the little hotel office. She had never asked Dexter to spend the evening with her before, and she knew what it would mean. Emma Ray, when she got the letter the day before Maria's return, read it aloud to Dexter. When Emma read that Maria would like to have them both come in and spend the evening the brother and sister looked at each other. Dexter's homely, faithful face flushed, then turned very pale. Emma gazed at him with the sympathy of a mother, rather than of a sister. Nobody knew how she had pitied him, and how hard she had tried to help him. She smiled with the loveliest unselfishness, then she looked again at the letter in her hand. "Guess Maria has been eatin' humble pie," she thought to herself, then she reflected how much she thought of Maria, and her brother, and how glad she was. "Well, I guess Maria thinks that the old friends that have always set store by her are the best after all," she said, and a moral perfume, as of the sweetness of humility itself, seemed to come in her face from the letter.

Bringing the Pygmies to America

BY THE REV. S. P. VERNER

[Mr. Verner was commissioned by the Louisiana Purchase Exposition to bring a company of the Batwa pygmies from Africa to America for exhibition at the Exposition. He completed this undertaking a little over a month ago. It is the first time, so far as is known, that these smallest people in the world have ever been seen in America. Mr. Verner, during a missionary life of many years in Central Africa, made close observation of the different tribes and of the country through which he traveled, and he is familiar with the Batwa and other native African dialects. He is the author of several books, among which are "Pioneering in Central Africa," "Among the African Pygmies," and "The Development of Central Africa." This article was obtained from him as an interview.—EDITOR.]

THE interest in the African pygmies dates back to the time of the ancient Greek poets and historians. Homer makes reference to a tradition about fights between the cranes and the pygmies in Africa, and Herodotus, Aristotle and other Greek writers, besides some of the Roman writers, also refer to the same tradition. But the existence and special character of these people were not thoroughly investigated until late in modern times.

It was while the battle of Gettysburg was raging, in July, 1863, that Paul du Chaillu was the first modern scientific traveler to discover the pygmies, about three hundred miles from the west coast of Africa, near the equatorial line. After him, Schweinfurth, in 1869, found them, 800 miles directly further east. Then Wissmann and Wolf together discovered others in 1886, a thousand miles south. Stanley found some on the Aruwimi River, not far from where Schweinfurth found them, and also some in the Semliki Valley, between Lakes Albert and Edward Nyanza, in 1888. These last are probably the descendants of those about whom the Greeks wrote, at the head-waters of the Nile, for the Nile River flows from Lakes Albert and Edward Nyanza. The present Governor-General of the Congo State found some not far from Stanley's Lake Kivu. They have been found at an altitude of nearly 10,000 feet, and also down in the lowest valleys. Those I found, in 1897, are in the same general territory as those discovered by Wissmann.

The anthropological character of all the people discovered by all these explorers is so nearly the same that it is practically certain that they are all one people, tho divided into different tribes with different geographical locations. No group of them was ever gotten out of Africa until this party now in St. Louis, and no one has ever been here unless possibly he was sold in slavery.

The scientific interest in these people has been chiefly because they must be the lowest types of the human race yet discovered. This is not merely because they are the smallest people in the world, but because the simplicity of their culture is so great. They measure from four feet ten inches in hight down to about three feet nine inches. Perhaps the average hight is about four and one-half feet. The conception in the popular mind that they are Tom Thumbs is a mistake. The peculiarity in their size is not at all that they are abnormal types of individual cases, but that there is a whole set of tribes, or races, of that size, and, secondly, that they have maintained their unusual type through thousands of years. It is hard to say how many of the pygmies are in existence, but of the pygmies of Central Africa that are known by white men to exist it may be said that they number perhaps 10,000, scattered over a territory as large as the United States. The question of how many more there may be who are unknown is a matter of conjecture, but probably there are ten times as many.

On my return to America from my first trip to Africa I wrote a good deal about these people, with the result that

Basboba and Luma, with the monkey of the community, brought with them from Africa. Basboba, who has already learned to say "Nickel," is caught in the act of pointing and crying "Nickel" to a photographer, fearing he will take a picture without paying tribute

when the Department of Anthropology of the Louisiana Purchase Exposition was organized by Dr. McGee, I was requested to try to get some of the pygmies to attend the Fair. I stipulated that they must come voluntarily, must receive the kindest treatment, and guaranties be given for their safe return to their people. The time when these negotiations were begun was so late as to make it extraordinarily difficult to accomplish the end desired. The total distance covered had to be greater than the circumference of the globe at the latitude of St. Louis, and most of the way was by slow ocean and river steamers, and some of it on foot. But for the fact of my pleasant relations with these people when I was there before, I would never have undertaken it.

On leaving this country I took with me a young colored man from Tennessee —Alonzo Edmiston—and a native African boy named John Kondola, whom I had brought over with me on my first trip. We left St. Louis the 11th of November, going by way of Washington to obtain the introductions from our Government to the Governments abroad. We arrived in Liverpool December 31, and spent the time until the departure of the boat for Africa in London and Brussels, securing supplies and arranging the necessary diplomatic negotiations. Then we left Antwerp, Belgium, on the 7th of January, arrived at the mouth of the Kongo River the last of the month, when our steamer went aground on a sand bank, and we necessarily missed an important connection at the Kongo Railway for a steamer on the upper river, which caused the loss of a month of our very precious time. This restricted our operations in the interior to less than a month, in order to get back to St. Louis in time for the Fair at all.

From Matadi, the port of the Kongo River at the bottom of Livingstone Falls, we went by rail through the Chrystal Mountains to Stanley Pool. Here the navigation of the Kongo is free for many thousands of miles along the main stream and its tributaries.

After some delay we obtained a steamer and went by the Kongo and its largest southern tributary, the Kasai, stopping at the junction of the Sankuru and Kasai rivers to wait for a second steamer, on which we went to the seat of government of the Kasai district, at

the head of navigation of the Sankuru River. It was necessary to explain our affairs to all the local officials, so that our expedition could go on without political suspicion or interruption of any kind. From this place we went down the Sankuru, and again by the main steamer of the Kasai River to the head of navigation of that stream, Wissmann Falls.

On the way we passed a rubber trading station which had been burned down by the natives and the white men chased off. We found also that several steamers had been attacked by the natives from the adjacent woods and some white men and many of their native friends killed in the last few years. The four white men on board our steamer took turns at night as sentries when the ship was moored off the forest, and one can imagine that it was not a situation calculated to soothe the nerves when a poisoned arrow might fly out of the bush at any time or the yell of the savages be heard.

The last day of our steamer voyage was up a part of the river unknown to the captains of the Government steamers, and the river, as was told me later by the natives, was higher than ever remembered before, so that, owing to some of the rocks being covered up by the high water, navigation was extremely dangerous. At the foot of the Falls it was necessary to cross over the river above the mouth of a little mountain stream flowing into the Kasai, in order to discharge our expedition and cargo at the right place for our purposes. While the captain succeeded in getting the steamboat across, he said it was the most dangerous piece of navigation he had ever tried in his life. I crossed in a canoe before the steamer to sound the way, and was obliged to climb out on the other bank on the limbs of the trees.

We disembarked at the foot of the trail leading up through the forest to the town of my old friend Ndombe, the paramount chieftain of all this region, who was also the feudal lord, in a way, over the Batwa pygmies. It was Ndombe's personal friendship for me before that had made my stay possible and pleasant. I walked up to his town alone —about twenty miles—so as not to alarm his people with a large following. I met with a most uproarious reception after they recognized me. They greeted me with the playing of horns, the beating of tom-toms, the shrieking of whistles, whooping and hurrahing, firing of flintlock muskets, and the whole town turned out for a big dance after the preliminaries were over. Ndombe sent enough people to bring up our cargo and party to his town, and the steamer departed.

The Batwa are a settlement of the small people already referred to who live somewhat as parasites on Ndombe and his people, who are unusually large men. Ndombe is six and a half feet in hight and is large and well proportioned. I may add that his color is yellow, not black. He is almost as yellow as the American Indian, altho evidently descended from the pure blooded African.

The Batwa have one settlement on the outskirts of Ndombe's town, near the beginning of the forest, which stretches down the mountain streams to the Kasai. They also have rough, primitive settlements down in the forest where they reside for purposes of the chase. The pure Batwa live entirely by hunting, and raise no crops at all. They exchange their meat for the farinaceous food raised by the larger people, and they also live on roots and herbs in the forest. They kill and eat the antelope, buffalo, elephant, python, ant-eater, leopard, wild-cat, lynx, wild boar, hippopotamus, besides rats, locusts, grasshoppers, ants, wood-worms, and caterpillars, which they dry in the sun. Their principal weapon is a bow with a bamboo arrow tipped with a very fatal poison. Besides this they have metal weapons, spears, knives and metal-tipped arrows, which they obtain by barter from the other natives.

There has been some little intermarriage between these people and the smallest of the surrounding larger tribes, but it is easily possible to distinguish the pure pygmy from the mixed.

Their houses are built of a hemispherical shape, consisting of hoops covered with leaves and being about five feet high, with a diameter of perhaps six feet. They are the most timid of all the natives, and, of course, the great difficulty before me was to get sufficiently into

communication with them in a short time to be able to talk the matter over.

I took the advice of Ndombe and the wise old men of his town, and his oldest son, Mianye, a magnificent young fellow, whom one would pronounce an aristocrat on sight. In order to begin the negotiations Ndombe advised me to go down to the pygmy village and give the children some salt, nearly all of the men and most of the women being away when I did so. The pygmies crowded around me at once, yelling and whooping for joy, until every living being in the little town was out, holding out their hands for salt. Salt is more precious than gold in the Central African's eye. I told them that if the rest of the town would come up to my bungalow next day I would give them some more salt, and next morning there was no standing room in my yard. This was the breaking of the ice, and subsequent operations, tho attended with many difficulties, terminated in my being able to persuade some of them to come with me.

Affairs were complicated also to a very considerable extent by a miniature Trojan war which was going on between Ndombe and an adjacent town. A warrior of the town of Belinge had slipped into Ndombe's town by night and eloped with one of the wives of one of Ndombe's principal counselors. Ndombe sent a messenger to Belinge with the word to bring the woman back or fight. And so they fought. And this war, with some intermissions obtained by my efforts, interfered with my work the whole time.

There were also complications arising through questions of trade and government, but we managed to steer through them all, and altho I was attacked with the fever and had constant recurrences of it, we managed to get down through the forest in a pouring rain on the morning of the 11th of May, to a steamer which I had arranged to come for me to Wissmann Falls, with a party of those who were willing to go.

There were more than those who finally came. Some backed down at the last moment, practically because their cour-

Group of five pygmies and three native Africans of other tribes. The two on the left and the three on the right are pygmies, and are named respectively, as nearly as written language can record the sounds of their dialect, Outábang, Bashoba, Schambe, Melinge and Lama. (The three other Africans are Kalamo, Sattina and Lambáng. Kalamo, the first in order of the three other Africans, is nicknamed by the pygmies Bobilla because he wears a dress, certain infantile-loving boys having taught them that Bobilla means "lady." They are quick to catch sounds and already repeat many English words.

age failed them. Some were afraid of the steamer, some stayed to keep up the fight that was going on, being afraid to leave their families during the war; the old men said that if they were to die they wanted their bones to repose in their own country and not abroad, and the women were not allowed to come principally because they said that if they lost their women they would have no means of keeping up the increase of the town, whereas it did not make much difference if they did lose the men—a commentary on the system of polygamy obtaining in the country.

The trip from Wissmann Falls to St. Louis was unparalleled in point of time probably in the history of African exploration. We encountered terrific thunder storms going down the Kasai, which had fallen very much owing to the approach of the dry season, and the steamboat was sometimes almost blown away. We made our connections at the railroad and the ocean steamer at the very last moment in each case, and arrived in New Orleans on June 26th.

The impression which the pygmies have received of this country has not been altogether gratifying. Since they have been here they have covered me with confusion, over and over again, by referring to the fact that when I was in their country they met me with presents, with food and with palm wine and everything that could be desired, and gave me a great welcome, but since they have come here the white people do nothing but come out and stare at them and laugh at them. It would make them much happier, they say, if the white people would treat them with the same politeness with which they treated me.

ST. LOUIS, MO.

A Middle-Aged Woman

BY REBECCA HARDING DAVIS

THE clock was pointing to six when Mrs. Shore and her son's wife turned into a shaded street on their way home. The air blew sharply up from the sea. Mrs. Shore buttoned her fur cape and quickened her pace. Maria, as usual, lagged a step behind her. Maria was a tall, willowy girl with delicate features and milk and rose tints in her skin. She had the conscious pose of the acknowledged beauty in a small town, for in her old home, Ford City, Kansas, newspapers had ranked her with Helen of Troy and Recamier. But her blue eyes were dull and evasive; she laughed at the end of every sentence, as if not sure of herself or her companion or of anything else.

When silent she always held her mouth a little open. John Shore had married her a year ago in Ford City and brought her home in triumph.

"Now, mother," he said, his round face red with delight, "you have a daughter at last!"

His mother looked at her and her heart stopped. It seemed for a minute as if cold water, instead of blood, rushed through her body. But she took the girl into her arms with some gay, loving words.

In this as in every emergency of life Frances Shore was sure to speak the right words.

More than that. She knew that she spoke them. She applauded herself secretly for her tact and nice feeling every hour of the day. Nobody ever saw a trace of vanity in the woman. But at heart she assuredly knew her own full v lue.

After that first day John always believed that his Maria was as dear to his mother as was his own stupid, honest self.

The two women had been together all day. The morning they had spent at St. Elizabeth's Hospital. It was the only hospital in this little seaside town, of which the Shores were the founders and

rulers. Mrs. Shore had given half of the money to build the hospital and had coaxed the rest from the New Jersey Legislature. It was as dear to her as one of her children. She had pled with men and prayed to God for it. Every day she carried provisions, bandages, jam and linen to it. She knew every nurse and patient in the wards. She felt that it was she who had mothered it, and no Saint Elizabeth, living or dead.

They had been shopping all afternoon, buying carpets, curtains and the like for Maria's house, into which she had moved last week. Mrs. Shore was recklessly generous to her new daughter. But Maria's thanks were brief. She yawned nervously, often. It sapped the strength out of her to be with Mrs. Shore all day. Her mind moved slowly, and for her to follow the older woman's train of thought was like trying to catch heat lightning. Mrs. Shore's brief, joking sentences to-day had flashed new meanings on every side; into the snarl in the hospital's accounts, into the dyeing of carpets or the shape of a cabinet. At home Maria had always found her even more trying. There was no subject on earth or out of it that the Shore men did not bring up to overhaul with Frances.

Now, Maria knew that in Ford City she had been reckoned a most intellectual woman. She was able and ready now to discuss all really important subjects: the work of her Chautauqua circle, the Duchess's last novel, the new cut of sleeves. She had closely observed since she married Doctor John the set to which the Shores belonged in Scaburgh. She knew all about their descent, income and clothes. Maria judged all human beings by these three essentials. She knew the genealogy of her own family, the Pynes, better than she did the Ten Commandments, and reckoned it a matter of much more importance. But the Shores cared for none of these things. At every meal they jerked her mind from the new star in Orion to yesterday's doings in Parliament or the news from The Hague, or U. C. P. preferred stock.

Maria was shrewd enough to see that the Shore men—husband and sons—did not come to Frances for information on these matters, but for a mental tonic before they went out to the day's work. They were of German descent (Deschauer used to be the name), sluggish, kindly, easy-going. Their mother every morning trimmed their lamps and put oil in them and lighted them for the day's work. Maria's little soul and trivial mind were nagged by the older woman's strength. Why did John, now that he had a wife, go to his mother in every strait? Maria saw that there was nothing grave or judicial in Frances's temper or mind. She laughed one minute and cried the next. Yet, to-day, everybody, from the car conductor to Judge Paxton, had come to her about their own private affairs, and last week, when Joe Potts shot his brother and that silly little Mrs. Clafton ran away from her husband, they both came to Mrs. Shore in their horror of guilt, and Maria had to confess that she had helped them. Something went from her to them which put new life into them.

Maria, seeing that she gave out so much in her life to husband, children, drunkards and all the other silly, guilty folk who followed her, wondered how she could eat such hearty meals or laugh over stupid jokes. Maria had no sense of humor. She seldom laughed. She eyed the elder woman now with dislike and contempt. She was a bore, a nuisance!

The opinion of the little Western belle of her new kinsfolk would have amazed the Shores if they had known it. The cat on the rug may not understand a word you speak, yet her idea of your character is definite and clear.

Dr. John Shore met his mother and wife at the corner and took Maria home with him. She looked back with a frown at Mrs. Shore's tall, slight figure as it passed under the trees.

"I tried to persuade your mother to buy some handsome ready-made costumes to-day," she said. "Something to suit her position. There is nothing stylish in those plain dark gowns she wears."

John lifted his eyeglasses and stared after his mother.

"Doesn't she dress properly?" he said anxiously. "Oh, you must be mistaken.

Molly. I never saw any woman with the peculiar air of distinction—of high breeding—that my mother has."

"I am glad you are satisfied! Perhaps you would like *me* to give up my silks, and rig myself in coarse cloth?" snapped Maria.

"Oh, darling,—*you*—" The rest was whispered, and the pretty color and smile flashed back into her face.

But John was uneasy. "I'm afraid, Molly, you don't appreciate mother," he hesitated. "You mustn't judge her by her clothes. You see she really made this family. My father often says that. Long ago, while we were little chaps, his health suddenly gave way—nerve prostration they would call it now—and she took hold of the business, and for five years she ran the mills. She bought this land here then, too, for a trifle, and laid out a village and induced her wealthy friends to build handsome villas and make Seaburgh the fashion. So, when my father came to himself, as one might say, he was a rich man and could give up work. Then she used to coach Bob and me at school, and pushed us into the business we were made for—Bob, the law, and me, medicine—when my father wanted us to keep in the mills. I ought to have told you the kind of woman she was before now," he added in a deprecatory tone.

"Oh, it wasn't necessary," said Maria briskly, adjusting her veil. "I've always been considered a good judge of character. One sees at a glance that Mrs. Shore is a superior person. But in *my* opinion, a woman of her position should wear stylish clothes. When she does not she errs in taste. Of course, I may be wrong, John. I'm from the West, you know. None of the women of my family ever ran woolen mills or laid out towns, but they always understood society and costume. My mother was noted as the most elegant dresser in Kansas City. I must say that in my opinion Mrs. Shore is lacking in that very essential point, dear."

"Yes, no doubt." John stared about vaguely. "Yes, you might give her a hint, Molly."

They had come to the gate of their own house.

"Your mother," said Maria, "has ordered vines to be set out in this front yard. She says it will look like a bower next summer. I'm not a bird! I don't want to live in a bower. I want the sun pouring into every room."

John looked at her anxiously. "We all think mother has such good taste—I don't know, I'm sure—A bower—Well, come in, dinner must be ready. Where's the boy?" he shouted up the stairs.

The nurse appeared, baby in arm.

"Where are his coral sleeve bands, Ann," said Maria. "And his lace dress? Who put this wrapper and sacque on him?"

"Mrs. Shore stopped on her way down street this morning," said Ann pertly. "She said it was too damp for his neck and arms to be bare. He'd have croup. I supposed *she* knew."

"Very well." Maria swept into her own room with the child in her arms. She hugged him when she was alone until he screamed, her pale eyes flashing. He's my baby! This is my house!" she said. "I may not be a strong-minded woman, but I'll not be trampled under foot any longer!"

John came in. "Fire going? I'm frozen to death. Dinner's ready. Bless my soul, Molly, what's the matter? You've been crying!"

"No, no; I'm just tired." She laughed, dabbing her cheeks with the baby's blanket. Maria loved her husband. She did not mean to worry him. She would put up with his mother's meddling. She bathed her face, gave the boy to Ann, and went in to dinner, where she feigned an interest in the antitoxin argument and laughed at John's jokes in a way which was absolutely heroic. For the limp belle of Ford City was human after all. Even the most boneless worm must have ground of its own in the universe in which to dig its hole.

Frances, meanwhile, had walked briskly homeward. The air was clear and frosty; through the windows of the comfortable dwellings which lined the street the red fire-light shone here and there, and savory scents of supper came out into the cold. Sometimes smiling faces appeared at the windows and a hand was waved to Frances, who nodded back gayly and hurried on. The Shore

homestead stood just where the street opened out upon the beach. Around it in an inclosure was a large tract of that ancient forest which edges the New Jersey coast. Its age is unknown. These low, brawny oaks and gnarled cedars were the first growth of the earth after Ocean County rose out of the sea. Their roots take hold of marl and the skeletons of fishes dead before the flood. It had been Frances who had fenced them in around her home. No royal park in England or France, she used to say, could boast of trees more ancient than these, or with as strange or significant a history. She knew and loved every one of them and she was sure they knew her and had their own opinions about her.

As she stood by the gate she struck the snow from the branches of one old cedar, gray bearded with lichen, with soft, friendly blows and that sudden throb of happiness in her breast which comes to all of us sometimes from strong vitality and sheer health of body and brain. She stopped a moment, looking down to the beach. There had been a nor'east storm and the surf rolled in heavily with sullen thunder. Red lights flamed up behind the hills in the west. She could have a happy half-hour on the beach before dinner alone and in quiet. There were dull souls who cared nothing for Nature. She thanked God that her soul was not dull.

She turned to go down and then stopped, remembering that her husband would be alone, and that he liked that half-hour's gossip alone with her in the evening. She reminded herself that in the thirty years of her married life she had never once for her own comfort cheated him of a moment's pleasure. She turned, but at that moment the bells of St. John's rang the Angelus. Frances stood still. She felt that she was too really devout a woman to race along when the hearts of so many pious folk were lifted in prayer. As she waited she thought of that other woman called of God to give the world its helper, and of how as He suffered and died the sword had pierced her soul also.

"Hail, Mary! Blessed art thou among women!" she said, the tears coming to her eyes.

When the bell ceased she still stood thinking. "I, too!" she muttered with a complacent smile. "I've done the best I could, Lord."

And her best had not been mean or despicable either, she thought. It had been no little thing to found this town, to nurse an unable, weak man, to make men of her boys, to run the mills—even the hospital was a monument to her ability and her generosity. Her life, she felt, had been able and helpful beyond that of most women—or men. It would really only be fair that there should be some recognition of it by Whoever ruled things yonder, she thought, looking confidently into the yellow sunset. Many people had some triumph in their old age—no doubt as a sign of God's approval—great wealth or fame, or happiness came to them. Or they went out of life victoriously—Elijah was carried away in a chariot.

She walked on, half smiling, as she wondered in what way—long hence, in her extreme old age, as Death inevitably approached—God would signify His approval of her, so that everybody would know.

But she must go home and read the evening paper to Hugh.

As she walked across the beach she remembered the old fable of Juno when she took on the disguise of a peasant woman to do homely work for inferior creatures.

There is no doubt that down in the secret depths of her soul Frances looked upon Hugh as an inferior. He had no vague longings for perfection; he was content to be dull and honest and kind. They had been children together; he had always loved her.

Once she had met the man who she knew was created to be her mate. He had passed out of her sight forever and had not claimed her. She had married Hugh Shore and given to him the last tithe of duty, but she never had ceased to secretly pay homage to Garneaux in her soul and to wonder why he had not claimed her.

In the tension of her thoughts just now it flashed upon her that when he was leaving the world he would understand his need of her. He would call and—she would answer.

Yonder—and she looked into the far retreating twilight—he would wait for her.

Then a strange thing happened.

The call came.

Not from the great revolting sea, nor the sunset, nor even the moaning wind. The whole matter was beyond words commonplace and small. She had turned into a street, and, passing an alley, frowned as she noticed some tubs of garbage, when a chill lighter than a breath touched her chest. She stopped short, looking around. Then a voice, which she had not heard for thirty years, spoke quietly to her.

"Now!" it said; "Frances, now!"

* * * * * *

When Mrs. Shore came to herself she was standing in the night far down the beach, calling again and again the name of a man. It was not that of her husband.

They had a family party at dinner that night, and waited a long time on Mrs. Shore. When she came in she was as exquisitely dressed and gay as usual. But there was a deadly pallor on her face.

Will, who was a keen-sighted fellow and his mother's boy, took her aside.

"Something is wrong," he said. "What is it? Tell me, dear."

"Nothing. I felt a little chill on the beach. It is nothing. Come here, Will." She walked to the window and stood looking into the dark.

"What is it, mother?" He took her hand and stroked it gently.

"I want to talk to you about—Jeanie."

He dropped her hand and drew back. "No," he said sternly. "No; better not, mother. That's over. I gave her up as you wished. I understand. It would never have done. It would have made you and father wretched. Her people are vulgar—impossible. She—But it doesn't matter what she is. I've given her up."

Mrs. Shore tried to smile gayly. "She is a good, innocent child and you love her. That is all we should have thought of. Never mind her people. Marry the woman you love, Will; I'll straighten out the difficulty with your father. I'll talk to you to-morrow. But—for God's sake, boy, marry the woman you love!"

A moment later she went to Hugh with a cup of hot coffee, giving him an affectionate pat on the shoulders. He nodded kindly.

Two weeks later Mrs. Shore brought Jeanie Wood home for a visit. Her engagement to Will had been announced. She was a pretty child with sincere, tender eyes, and Frances petted her as she never had Maria.

"I want to show you all my little ways of housekeeping," she said to her one day—"the ways Mr. Shore and Will prefer, in case, when you come to us, I should go away—for a while."

Jeanie smiled, with an anxious frown. That evening she asked Will: "Must we live here when we are married? I should not be afraid of your father. But Mrs. Shore—It would be like hobnobbing with Madame de Stael or an Empress—"

Will stared at her. "Why, mother's a real sport! There's nobody I'm as intimate with. You don't know her."

But he was anxious after that. It might be better that he and Jeanie should go away. Mother certainly was peculiar, if you didn't know her—

Mrs. Shore quietly made ready the house for the young couple. "Mr. Shore's apartments," she said to the upholsterer, "will not be altered. But I am going away, and you will refurnish my rooms for my son's wife."

She looked forward to this going away as to a great tragedy and triumph. Her husband watched her silently. Did he suspect that Death had her by the hand, she asked herself sometimes, pacing up and down her room. Did he guess that she had been called by the man destined to be her master when life began?

Sometimes, looking about the room, she saw the thousand little trifles which Hugh had slowly gathered to make her life easy and pleasant. He had loved her greatly—in his way.

Then for a moment his way seemed the best and dearest thing on earth.

What could she do out yonder without Hugh?

But had she not been called?

The end came, suddenly.

Her brother George came down from

New York bringing much gossip, political and literary. He was a very talkative man.

"This is a sad thing about Garneaux," he said as they sat about the fire in the evening.

Hugh glanced quickly at his wife, but said nothing.

"A man so helpful to the world—a great scientist," said George.

"Philip Garneaux is dead," said Frances slowly, as if reciting a lesson. She rose pale and trembling. "He died on the tenth of this month at six o'clock in the evening. The Angelus had just rung."

"Dead? Not a bit of it!" said George with an unpleasant laugh. "Pity he hadn't died. Everybody always knew Garneaux's moral character was rotten to the core, but it has come out now that he was actually married to two women. He had to put off at night for Brazil or he would have gone to the penitentiary."

Mrs. Shore sat down. She did not hear what it was they said. Hugh was silent. He looked at her furtively now and then. She knew that he did it. Did he understand? She had made a dream out of her own vanity and worshiped it all of her life, blind to the man—better than all men—who loved her. Her dream was a sham, God had given her a reality.

She went out of the room presently and did not come back that night.

Mrs. Shore made some changes the next day, arranging that Will and his wife should go to a house of their own.

"Your father and I will need our home to ourselves," she said to them.

"You are not going away as you said, then?" asked Jeanie.

"No, not now," she said.

After that the family vaguely felt that Frances had lost the backbone of her character. Her brother said bluntly that it was her conceit that was gone. Whatever it was, they loved her better without it. How much her husband knew of her real story she never could tell. She thought his silence was heroic, and loved him the more for it. She threw now all the longing and passion of her dreams into her love for him.

That is the way in which the real Frances Shore was born again to life. Not until middle age—old age sometimes—do we see the difference between our dreams and the realities which God gives us.

PHILADELPHIA, PA.

A Reckoning

BY THEODORE ROBERTS

[" There will come a reckoning with England. . . . We recognize her as our old enemy, who has stood in the path of Russian development."—PRINCE HILKOFF, Ob KARTOMSKY.]

Ye who would reckon with England—
Ye who would sweep the seas
Of the flag that Rodney nailed aloft
And Nelson flung to the breeze—
Count well your ships, and your men,
Count well your horse, and your guns
For they who reckon with England
Must reckon with England's sons.

Ye who would challenge England—
Ye who would break the might
Of the little isle in the foggy sea
And the lion-heart in the fight—
Count well your horse, and your swords,
Weigh well your valor and guns
For they who ride against England
Must sabre her million sons.

Ye who would roll to warfare
Your hordes of peasants and slaves
To crush the pride of an empire
And sink her fame in the waves—
Test well your blood and your metal,
Count well your troops and your guns
For they who battle with England
Must war with a Mother's sons.

BATTERSEA, BIRMINGHAM, S. W.

The Pension Bureau

BY E. F. WARE*

UNITED STATES COMMISSIONER OF PENSIONS

INTO the Pension Bureau flows an unending river of woe. Each mail brings its burden of distress, and the volume of the river can be realized when it is known that over five million pieces of mail are handled by the Bureau annually. Its Mail Division is as large as the post office system of some of the minor cities of the country, about 40 clerks being employed in that division alone.

Who write all these letters to the Bureau? They come from many sources. The United States Government has nearly a million pensioners. Many of these have requests and many have grievances to present to the Bureau. Then there are over 20,000 pension attorneys, who carry on business with the Bureau, mainly by correspondence. There are about 200 traveling examiners looking after the scattered work of the office and reporting daily. There are 4,500 physicians who make and report 200,000 medical examinations every year. There is a vast amount of Congressional correspondence. There are nearly 15,000 new applications for pensions per month. There is an enormous correspondence from outside sources setting forth the griefs and sufferings of soldiers and widows, dependent mothers and dependent children, as well as the never ending stream of fault-finding from the 120,000 persons whose claims are annually rejected. These, together with unceasing calls for reports concerning Revolutionary ancestors, concerning pensioners of other wars, the deaths of relatives, guardianships, mistakes, make a sum total that is exceedingly perplexing to handle. All of this mail passes through the well defined and carefully systematized channels of the Bureau, and while it would be vain to attempt in a brief article to show how all this is done or the methods by which the correspondence receives progressive treatment until the end is reached, yet it is achieved by a system in which the 1,500 clerks in the building take each a part. The system is wonderful in its accuracy and constantly increasing in efficiency. In the following pages the methods are briefly outlined, and the accompanying diagram represents in a general way the track and path of an army claim through the Bureau.

First Steps.—When a pension claim first enters the Bureau it is in the form of a declaration, signed and sworn to by the claimant and two identifying witnesses, the name of the attorney, if any, being shown in the body of the declaration. It is received in the Mail Division, where the date of its receipt in the Bureau is stamped thereon. It is then sent to the Law Division for examination as to whether the attorney appointed by the claimant appears on the list of recognized attorneys authorized to practice before the Bureau. If so recognized, it is so certified; if not, a letter is written to the attorney explaining what is necessary for him to do to qualify. The declaration is then forwarded to

The Record Division.—Here the claim is examined to determine whether it is properly signed and executed, and whether the officer before whom it was made was duly authorized to administer oaths for general purposes. If the magistrate uses a seal, and the same is affixed to the *jurat,* further verification is not required. In this division is a list of officers, not using a seal, who are authorized to act, and before the declaration leaves the division it is made complete by the claimant in all respects. When its regularity is established the claim is then jacketed, numbered and recorded.

A record is kept by companies and regiments, and also alphabetically by a three-letter combination. Thus, if the name of an applicant is *Webster,* an entry is made under the combination *Web,* and so on. Careful search of the records is made to show whether a prior claim has ever been filed on account of the service of the

* From an interview for THE INDEPENDENT.

The Pension Bureau Building at Washington, D. C.

same soldier. If so, the claim is consolidated with the papers in the prior application, and it often happens that two or more persons claim to be the same soldier's widow. There have been as many as three claims made by three different women, each claiming as the widow of the same soldier. Frequently the wife of a soldier, having separated from him and supposing him dead, files a claim as his widow, but the investigation of the Bureau finds him alive and drawing his pension himself. Sometimes the same woman claims two pensions on account of her marriage to and the death of two or more soldiers; sometimes she claims as the widow of one soldier and as the dependent mother of another. Sometimes it also happens that where a soldier served in two different regiments one woman applies on account of one service and another woman on account of the other service. These are some of the many complications that arise in the examination of claims in the Record Division; but with the system now in vogue the 125 clerks employed therein seldom make an error in the recording and numbering of claims; and under it it is practically impossible for two pensions to be issued to the same person, or two pensions to be issued for the same service, for no one may draw two pensions.

After the circuit of the Record Division the claim is then ready for

The Pension Examiners.—All applications for pensions which come into the Bureau are divided into classes by State organizations and forwarded to one of the five adjudicating divisions to which they properly belong. These divisions are called the Old War and Navy, the Army, the Eastern, the Southern, and the Western. In each one of these are from 75 to 175 clerks, according to the amount of work of the division. When a claim is received in an adjudicating division it is assigned to an examiner. His first duty in the case is to call upon the War Department for the military and the medical history of the soldier upon whose service the claim is based. By reason of the excellent system organized in the War Department by General F. C. Ains-

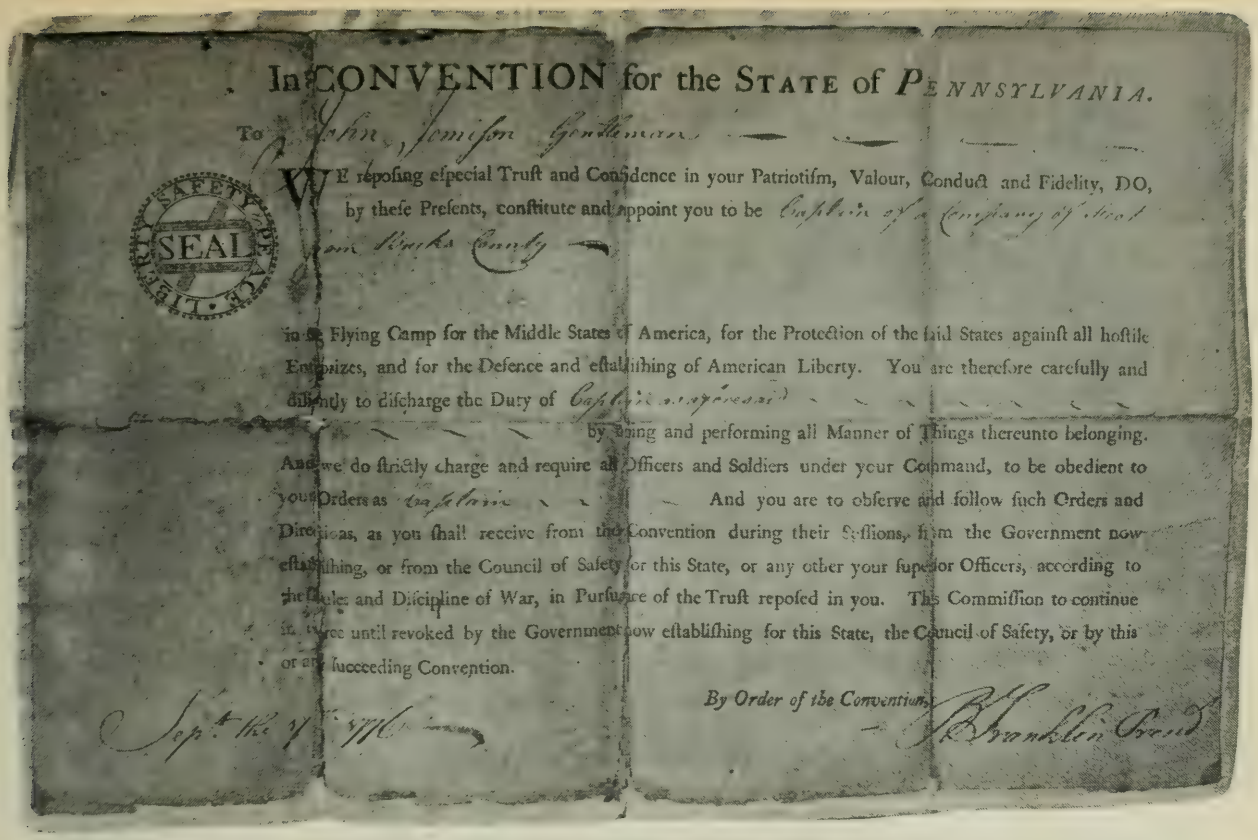
worth this information is speedily furnished, and the case returned to the examiner, who sends an order to the soldier to appear before a certain medical board for examination that the facts of his case and his physical condition at the time may be determined. When received the surgeon's report becomes a part of the record in the case, and a call is then made upon the claimant's attorney, if he has one, and if not upon the claimant himself, for the necessary evidence to establish his claim. In a case where a widow or dependent relative is involved such a call is made immediately after the receipt of the report which gives the military and medical history of the soldier.

When the evidence is all in the adjudicating division admits or rejects the claim, then the functions of the division in the particular case ceases and the examiner prepares a brief of the same for submission to.

The Board of Review.—This is a sort of Supreme Court of the Pension Bureau, and consists of reviewers and re-reviewers. After leaving the adjudicating division the papers of the applicants, made up of affidavits and depositions of witnesses, are passed on to the reviewers in bundles of twenty-five and fifty. The reviewer goes over all of the evidence, and enters his decision on what is called the " brief-face " that goes with the case. If the case is legally established he approves it for admission, indicating on the face of the brief the particular disabilities shown by the proof. If the claim has no merit, or cannot be proved, the reviewer enters up a rejection, giving fully the grounds of such action. The case is then passed over to a re-reviewer, who makes a critical examination of all the evidence, both legal and medical, and it is his duty to see that every point in the case is covered by competent and sufficient evidence. As the reviewers act for the Commissioner, they are the sole judges of the weight and sufficiency of evidence to establish a claim. If the re-reviewer concurs in the

The United States Pension Commissioner, the Hon. Eugene H. Ware

finding of the reviewer the case is said to be legally established, or is finally rejected. When the reviewer and the re-reviewer find that the evidence is not sufficient they return the case to the adjudicating division, indicating their objections to taking final action and suggesting what further steps should be taken by the examiners. The Board of Review also has authority to refer the claim for special examination to determine its merits by inquiry through a special examiner.



If medical action is necessary the case goes to

The Medical Division.—In this division there are also medical examiners and reviewers. The case is passed over to a medical examiner, whose duty it is to fix the rate to which the claimant is entitled. Another medical reviewer then goes over the case, and if he agrees with the first examiner the medical action is complete. Many questions of a medical character arise in these cases, all of which are decided by the medical examiners and reviewers under the direction of the Medical Referee. In the progress of a claim through the Board of Review, or the Medical Division, if the reviewer and re-reviewer, or the medical examiner and medical reviewer, fail to agree in their findings the case goes to the Chief of the Board of Review or to the Medical Referee, as the case may be, in the nature of an appeal, and the question is then finally decided by such a chief, his decision being binding upon the reviewer. The rules, however, provide for an appeal by the reviewer, or the re-reviewer, from the decision of his chief to the Commissioner, whose decision when rendered is final.

It will readily be seen that no combination of clerks could possibly be organized, or any arrangement made, by which a claim without merit could be fraudulently decided or railroaded through the Bureau without a full examination. No examiner, reviewer, re-reviewer, medical examiner, or medical reviewer knows before hand what particular cases will be assigned to him for examination, and if a mistake is made by one of the persons handling a case, it is sure to be detected sooner or later. But this is not the only safeguard now provided by the Bureau: in all cases involving a first payment in excess of one thousand dollars a still further review is made by the Commissioner, who has a special staff

An Original Discharge Paper Signed by Paul Revere Was Filed in the Pension Bureau as Evidence in a Pension Claim

In CONVENTION for the STATE of PENNSYLVANIA.

To John Jamison Gentleman

WE reposing especial Trust and Confidence in your Patriotism, Valour, Conduct and Fidelity, DO, by these Presents, constitute and appoint you to be Captain of a Company of Foot in Bucks County

in the Flying Camp for the Middle States of America, for the Protection of the said States against all hostile Enterprizes, and for the Defence and establishing of American Liberty. You are therefore carefully and diligently to discharge the Duty of Captain aforesaid by doing and performing all Manner of Things thereunto belonging. And we do strictly charge and require all Officers and Soldiers under your Command, to be obedient to your Orders as Captain And you are to observe and follow such Orders and Directions, as you shall receive from this Convention during their Sessions, from the Government now establishing, or from the Council of Safety for this State, or any other your superior Officers, according to the Rules and Discipline of War, in Pursuance of the Trust reposed in you. This Commission to continue in force until revoked by the Government now establishing for this State, the Council of Safety, or by this or any succeeding Convention.

By Order of the Convention, B Franklin Pres.t

Sept.r the 1.st 1776

SEAL

SAFETY LIBERTY

An Original Commission Signed by Benjamin Franklin in September, 1776, Filed in the Pension Bureau as Evidence in a Pension Claim

of five men, who devote their time to examining these cases and who bring them to his personal attention for final action.

When the legal and medical findings have been taken in a case it is forwarded to a corps of raters, who give it a critical examination to determine whether the rates are proper and are such as are provided by law, and the raters also fix the amount of the fees to be paid to the attorney. It is then carried to the Certificate Division, where the certificate is written and all necessary papers pertaining to its payment are prepared. High payment certificates are signed by the Commissioner's own hand. The others are stamped with his signature by a clerk designated for that work, who keeps the stamp under lock and key. The certificates also bear the stamp of the Secretary of the Interior, and are not valid unless the seal of the Department is impressed thereon.

Pensions are made payable through *Eighteen Pension Agencies*, located in different parts of the country. The United States is divided into "agency districts," and all pensioners living in a certain district are paid at the agency located therein. Pension certificates and orders to inscribe the names of pensioners on the rolls are sent to the proper agents, who make up vouchers and send them with the certificates to the pensioners. The attorney in the case is notified of the allowance of the claim and the amount of fee that will be paid him by the pension agent.

When a claim is rejected the claimant has the right to enter an appeal before the Secretary of the Interior. Such an appeal is sent to the Assistant Secretary of the Interior, who has a force of 40 men engaged in looking up these appeal cases, which number many thousands. If the Pension Bureau is overruled the case is then returned to it for such further action as may be indicated in the decision of the Assistant Secretary. When final action has been taken in an admitted claim the papers are filed under its certificate number in the "admitted files." If rejected, the proper notice is sent to the claimant and attorney, and the papers are returned to the files of the proper adjudicating divisions. Some remarkably interesting papers of historic value have, in establishing pension claims, been placed on file in the Bureau during the time in which the United States Government has been paying pensions. Among them is an Original Commission, issued

An Original Note of Invitation from General Washington Was Filed in the Pension Bureau as Evidence in a Pension Claim

to John Jemison by Benjamin Franklin; an Original Application for bounty land executed by Abraham Lincoln in 1855; an Original Discharge Certificate bearing the signature of George Washington; an Original Commission signed by John Hancock, another one bearing Thomas Jefferson's signature; a written permit signed by Benedict Arnold at Crown Point in August, 1776, besides many others carrying equally distinguished names.

The Personnel of the Bureau.—The employees of the Pension Bureau consist of 1,367 men and 347 women, the majority of whom have proven their efficiency by long service. There is a pay day of the clerks twice per month. These payments are superintended by a woman of unusual ability. She has the remarkable faculty of knowing the face, name, rank and signature of every employee in the Bureau, and there can be no "padding" of the pay roll, nor can any one draw the pay of another employee. She is immediately notified of all appointments, resignations and separations from the service, and she makes it her duty to become cognizant of all new employees. She supervises all payments, and in many millions of dollars she has made no mistake. The promotion system of the Bureau is based on merit, and about 250 promotions are made annually.

The Pensioners and the Money Paid to Them.—The number of pension claims adjudicated now exceeds 1,000 per day. The number of certificates issued during the last calendar year was 152,000, but the greater part of these were increases from six, eight or ten dollars. The number of "originals"—that is to say, the number of pensions granted to those who had never before been pensioned—was slightly less than the number of deaths of pensioners during the year. The loss to the roll by death, and other causes, in 1903, was 47,388, or, in other words, about 4¾ per cent. Owing to the increased death rate, the losses to the roll during the present year will be about 51,000 pensioners.

The number of old soldiers who would be living on the first of July, 1904, were, by estimate, 870,000. One-half of the soldiers who came out of the Civil War are still alive; this seems almost incredible, as almost forty years have passed since that event. The average age of these living soldiers on July 1st, 1904, was 65 years, there being 435,000 of them under that age; and on that date (which is the beginning of the fiscal year of the Government) there were 150,000 sol-

diers of the war of the Sixties who are not yet sixty years of age. Had there been no further pension legislation or rulings, there would have been, on that date, 690,000 of these old soldiers on the pension roll, of whom the death rate for the next year would have been 4.17 per cent. At that time there were at least 260,000 widows on the roll.

These widows, together with the pensioners from the Spanish War, and those of the regular army, will keep the pension roll for a couple of years yet engrossed with the names of about a million pensioners, which roll may be augmented with the names of new pensioners who will come to it by the recent age order. The number of special pensions pertaining to the Civil War which Congress has passed are, in round numbers, about 12,000. The amount that has been paid out for the last five years, including the cost of maintaining the Bureau itself, has been approximately $142,000,000 annually, but it is well to remember in this connection that practically all of the money which the United States Government pays to its old soldiers immediately passes into the general circulation of the country.

The Service Pension.—The new pensioners who will come on the roll through the ruling known as "Bureau Order 78" will, without doubt, somewhat increase the roll. Pensions, as now administered, are of two classes, those which come under what is known as the "Old Law" and under what is known as the "New Law." In the former the disabilities must have occurred in the army service

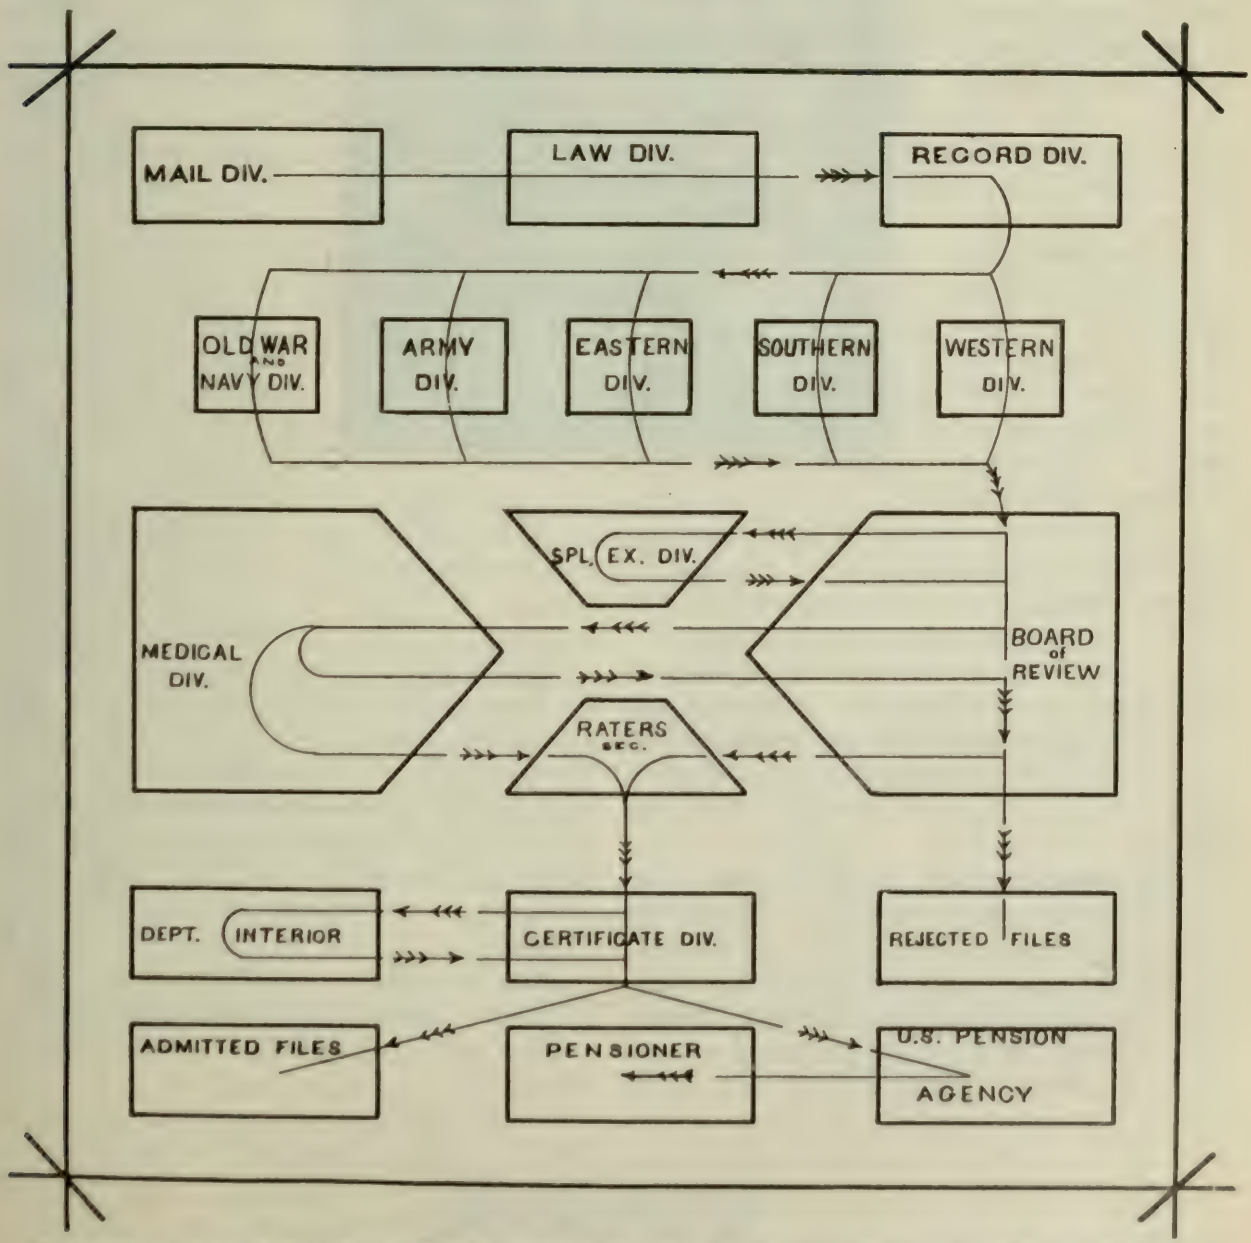


Diagram of the Path and Track of a Pension Claim in Its Course Through the Pension Bureau

in line of duty, and the pension rate is from $6 to $100 monthly. Under the "New Law" the disabilities may have occured since the service, if not of vicious origin, and carry a rate of from $6 to $12 per month to those who have served the requisite length of time. "Order 78" applies only to the "New Law," which is the statute of June 27th, 1890, modified by the law of May 9th, 1900. This law pensions the soldier only for disabilities which incapacitate him from earning a support by manual labor. In every case the pensionable infirmity must be bodily. Mental infirmity is not considered except as it affects the power to earn a support by manual labor. And no matter what the mental power is the soldier is pensioned on his bodily disabilities. Such is and long has been the law of Congress. Under "Order 78" no one but an old soldier is affected. It does not include widows, minors or dependent parents. Those who are receiving a pension of $12 or more do not come within its limitations, as no one can receive more than one pension at the same time, and the order does not provide for a second pension in addition to the one now received.

The Court of the Pension Bureau Building. The Inaugural Balls are held in this court. Ordinarily the major part of this floor space is filled with file cases

The minimum age limit of the order is sixty-two years, and this limitation was decided upon only after a full consideration of the statistics of the Pension Bureau extending over its recent history. In 1893 the great army of old soldiers, then numbering over a million, averaged fifty-five years of age. Time passed and the main body of this army in five years had reached the age of sixty, the head of the column sixty-five, and the advanced guard sixty-eight. Each year's experience showed that many of the soldiers were disabled at sixty, and that most of them were one-half disabled at sixty-two, and were more disabled still at sixty-five and sixty-eight, while there were scarcely any at seventy who were not totally disabled for earning a support by manual labor. The statistics of the Bureau further showed beyond dispute that almost no soldier of the age of sixty-two but could prove by medical examination, and to the satisfaction of his neighbors, that he was one-half disabled. It was another proof of the fact which history has repeatedly demonstrated that service in the army burned the candle at both ends, that it shortened life in youth and shortened it in old age. Such pensions have been the policy of our Government toward those who have defended its flag. Thirty-nine years after its close Congress found that the veterans of the Mexican War were pensionable at the age of sixty-two. This was not guess-work, but an intuitive perception by Congress of the facts. It is urged that sixty-two, the minimum age limit, is too young a period at which to apply the term of partial disability. Possibly it may be in civil life, yet where is the business firm of to-day which is taking on employees at that age?

Washington, D. C.

The Che-foo Incident

BY SHERIDAN P. READ

THE press of the country, it is noticeable at this time, seems to be almost unanimous in condemning the stand made by Japan in not yielding back the little torpedo destroyer captured by the Japanese the other day in Che-foo waters.

Taken as an act independent of circumstances or past events, the seizure of this vessel by the Japanese was a grave breach of international etiquet. It must be remembered, however, that Japan is mixed up at present with two nations—the one, China, knowing very little about international law problems, and the other, Russia, knowing, but where her interests are involved caring little, for the traditions of international law. And with these two points before us, we also should not forget to realize that the Japanese have a memory.

In the spring of 1895, in the beautiful month of April, the Russians assembled the whole of their Asiatic squadron in the lovely harbor of Che-foo, and before the eyes of the whole world (the whole world was represented there, so to speak, because an event of historical importance was about to transpire—namely, the ratification of the Treaty of Shimonoseki by China and Japan), deliberately stripped their fleet for action, making use of Chinese soil for the storage of everything that is superfluous to ships about to undertake warfare. Raft after raft of spars was towed ashore, as well as all movable stuff that was inflammable. The writer was present at this time, and saw with his own eyes the flagrant way in which Russia made use of territory that did not belong to her.

And altho the writer was only a consul, and not supposed to busy himself seriously with international law problems, or with their infringement, yet he could not help wondering that some of the diplomatic representatives of the great Powers accredited to Pekin, and summering at Che-foo, did not jointly protest at the open way in which Russia was making use of neutral soil for a hostile demonstration against a friendly Power—Japan. The writer, however, kept his Government apprised of these doings and advised of their meaning as it appeared to him.

It had been given out that the intention of Japan was to escort its treaty ratification envoy to Che-foo with the whole of its fleet. This idea was abandoned and Ito, the Japanese envoy, appeared in Che-foo for the pacific purpose in hand on the date set—the 8th of May—in an insignificant merchant vessel.* As this little vessel dropped anchor there frowned down upon it in war paint and stripped for action the assembled guns of Russia's great fleet.

And what was Russia's purpose in all this? China and Japan had settled their little differences and were met to smoke the pipe of peace over terms that had been conceded by China, the vanquished, to Japan, the victor. There was nothing in these terms of peace contrary to international usage, but there was, however, something (a kernel of thought for Russia) which was contrary to Russia's designs for the extension of her sway on the Pacific coast.

Russia's trans-Siberian railway was nearing completion, with its terminus at Vladivostok, a Pacific port, unfortunately ice-bound for a third of the year. Russia, atlas in hand, in looking over the situation as modified by the new conditions of this treaty, found that Korea was free and independent (set free from China by Japan)—an independence that was bound to be safeguarded by the sentiment of the world, and therefore not to be encroached upon. In other words, Russia could conjure up no excuse for seeking an ice-free port within the hermit kingdom. Her outlet, therefore, for military and mercantile purposes upon the Pacific must be sought in another direction. There was but one other direction in which to look, and in

* The suggestion that he do this was made by the writer, then acting consul for Japan.

this direction—the Liao-tung peninsula—Japan was in mastery, this peninsula having been ceded by China to Japan.

The apex to this peninsula is Port Arthur. With Japan dominating the gulf of Pechili from such a fortress, Russia's aggressive and progressive designs seemed forever thwarted. To remedy this state of affairs Russia began by showing her teeth in the form of the hostile demonstration above mentioned. Nor did she conceal the object of this demonstration—namely, her displeasure at Japan's occupancy of a portion of China upon the mainland. Russia did not object to Japan's possession of the island of Formosa, ceded by the same treaty.

Altho the demonstration seemed to be futile, since the treaty was duly ratified, Russia's displeasure at Japan's presence upon the Gulf of Pechili met with support at Berlin and Paris. Japan was made to feel that her presence upon the mainland in occupancy of a portion of China proper was the beginning of what might end in the dismemberment of China, and in the disastrous scramble among the Powers for the pieces.

This looked as tho Russia was acting on purely altruistic principles. The Japanese were quick to catch the idea, and being peacefully inclined, quietly rearranged this feature of the treaty with China, and retroceded the Liao-tung Peninsula to China for a further money indemnity. Subsequent events have proven that China profited little by Japan's magnanimity. That portion of her estate which was figuratively in litigation—namely, the Liao-tung—was momentarily saved to China, but, as is usual in litigation surrounding estates, the party most concerned gained little.

Consequent upon Japan's getting off the mainland, at the behest of China's self-constituted counsel, Russia, Germany and France, Russia as her fee took Port Arthur and a substantial slice to the north; Germany, turning a missionary massacre into a territorial asset, placidly appropriated the country round about Kiao-chau Bay; France "rectified" her boundary to the south of China, encroaching a bit here and there; and England was cheerfully let into the game by the occupancy of Wei-hai-wei.

These moves came in dazzlingly rapid succession. They might have led to further inroads by the Powers, especially at the time of the settlement of the difficult questions arising from the "Boxer" disturbances, had not Mr. Hay, our Secretary of State, by one brilliant move checkmated the game. He secured the continuance of the integrity of China against further encroachments, by obtaining from each and every one of the Powers having treaties of peace and of navigation and commerce with China a written pledge that the "open door" policy of trade with the Empire of China should be maintained under all circumstances, thus insuring, indirectly, China's political and territorial entity.

Japan's chagrin at her virtuous withdrawal from the mainland must have been intense when summing up the results. Russia's diplomacy had succeeded marvelously well. It had gained for Russia an outlet for her trans-Siberian system at Port Arthur and Ta-lien-wan Bay, at which latter point she erected a new city called Dalny. China, having already granted concessions to syndicates of various Powers for the construction of railways, all of which were intended for "China's good," readily granted to Russia the privilege of laying rails to Dalny and to Port Arthur through Manchuria.

To all intents and purposes Russia's fondest dreams with regard to an adequate outlet on the Pacific (guarded by a fortress upon which China had spent millions in strengthening, and to which Japan had added further strength in her short occupancy) had been realized. And the beauty of the situation as far as Russia was concerned was that Japan, even tho doubtless disgruntled, had, nevertheless, acquiesced.

As Russia pushed her road down from the Siberian frontier she discovered that Manchuria was an extraordinarily rich province—rich in the precious metals, in coal, iron and in other things which constitute natural wealth.

The "Boxer" troubles intervened opportunely for Russia at this time, offering to her an excuse to pour troops into Manchuria for the protection of her railway property. But, somehow or other, after these troubles had ceased, Russia, altho repeatedly promising to withdraw her troops, whose presence

constituted the *de facto* occupancy of Manchuria in its entirety, increased, rather than diminished, their number. China protested in vain, and Japan naturally viewed Russia's disregard for Chinese supremacy in Manchuria with alarm. This alarm developed diplomatic negotiations between Tokyo and St. Petersburg, the results of which led to the present war, simply because Russia defied the usages of international law and would not stay her encroachments upon her weak neighbors, China and Korea.

Is it to be wondered at, therefore, that Japan, mindful of Russia's usual course of bullying the weaker nation, should be morally certain that Russia has not abandoned this, so to speak, life-long habit, even in spite of a drubbing that has not yet been sufficiently severe to take the conceit out of her? That Russia went to war at all upon soil that does not belong to her, that Russia is still at war upon such soil, is sufficient reason for Japan to take nothing for granted. The sentiment of the world should not hold Japan at fault in applying unusual methods to an unusual situation, which sums up in the observer's mind somewhat as follows: That Russia's attitude is "Heads, I win; tails, you lose."

Japan feels that in this war she is fighting not only for the maintenance of her own integrity as a nation, but also in behalf of her weaker sister nations, and in the assault of Port Arthur she is fighting not only with the belief that its possession is an indispensable factor in preserving that integrity, but with the zeal of one who struggles to recover an invaluable treasure of which one has been unjustly deprived.

With the fall of Port Arthur Russia's supremacy on the Pacific cases to be worthy of any consideration until such time as Japan forfeits the respect of the world by a breach of international etiquet that is really serious and not so trivial as the Che-foo incident.* It is safe to predict that none of us will live to see that day.

* In further support of Japan's rightful course in entering Che-foo harbor to dislodge the destroyer, failing which she seized it, it is a fact well known to North China residents that Russia has a considerable quantity of war supplies at Che-foo stored within the godowns (warehouses) erected by her immediately following her warlike naval demonstration of April-May, 1895. Ground bordering the inner harbor of Che-foo being unavailable for the erection of these warehouses, Russia obtained permission from the Chinese Government to fill in the foreshore of the premises of the long established firm of Fergusson & Co., and by so doing thus acquired sufficient land. Fergusson & Co.'s grievance against this act was "squared" by the payment of a sum said to be taels 30,000.

NEW YORK CITY.

Russia's Future Constitution

BY A SENATOR OF THE EMPIRE

[The author of the following article is one of the best known public men of the Russian Empire. We are not at liberty to give his name, for obvious reasons. But the mere fact that he should speak on this subject is significant, and gives color to a widespread belief that one of the results of the present war will probably be the granting of a constitution of some sort to All the Russias.—EDITOR.]

I DO not think that the present autocratic system can last long after the close of the war. Autocratic and centralized Russia must become a federation, eventually. I say eventually, because I do not think that the political transformation, which is necessary and inevitable, can have as an immediate result the organization of a federation of States. The long and serious study which I have given to this question has convinced me that this autocratic empire must first become a constitutional monarchy, in which decentralization must be made one of the dominant features.

The whole territory of the empire should be divided into provinces administered in accordance with the principles of self-government applied in the most liberal manner. All legislation of a local nature should be intrusted to provincial assemblies, tho the Emperor would enjoy the right, surrounded by a responsible ministry, of approving or vetoing all measures.

The division into provinces should be

made in such a way that the different peoples are grouped, as far as possible, in accordance with their respective nationalities. The law should make it possible for non-Russian nationalities to develop their individual culture, tho this provincial autonomy need not necessarily be the political autonomy of a State.

I think, for instance, that the Ruthenians and the Lithuanians, whose political traditions are already effaced, would be satisfied, at least at the start, with a large share of provincial autonomy and with the consciousness that an end had been put to all attempts of Russification. The kingdom of Poland should be revived, if not immediately at least as soon as could be introduced the necessary preliminary reforms of every kind called for by the present state of things in that unfortunate country. Poland could then join the empire.

As regards Finland, which has never ceased to be a State by itself, tho forming a part of the empire and maltreated by Russia since 1899, Finland should not be included in the frame work of the proposed Russian constitution. She has long had a constitution of her own. All that is necessary to restore order and content is to abolish the decrees which have violated the Finnish constitution. It would also be required that the constitution of the empire expressly recognize the fact that the grand duchy is governed by its own constitution, which could then be reformed in accordance with the needs of Finland, but without any sort of interference on the part of Russia. To re-establish the infringed rights of Finland is a much easier task than to accomplish the political transformation of the Russian Empire.

I think that the movement looking toward the uplifting of the non-Russian nationalities of the empire should go hand in hand with the efforts of the Russian people to transform their autocratic system into a constitutional one. The Russians themselves are oppressed just as are the heterogeneous nationalities which go to make up the great empire of all the Russias. But if the latter should unite to act independently of the Russian element of the empire, this might awaken in the latter a chauvinistic spirit which would be detrimental to the best interests of the former.

Autocracy is the common enemy of all the peoples of the empire. It can be vanquished and abolished only in case the constitutional party, which has been slowly forming during the past few years, finds it possible to act in the name of all the peoples who, politically speaking, constitute at present the Russian nation. It seems to me that the many different nationalities would be acting in their own interests if they were to unite their efforts to those of this party.

If I am not mistaken, a broad decentralization plank, such as I have described above, is a part of the platform of this constitutional party. By securing the realization of this reform we would arrive, in due time, at a further evolution which, in the end, would transform Russia into a federation of autonomous States.

It is evident that it is best for civilization in general that Russia become a constitutional State, and that the reign of established law take the place of the reign of arbitrariness. Then only can she develop her natural wealth and become a really important market for the products of other countries. Then only, too, will she cease to be a perpetual danger to the cause of universal peace.

Russia, August, 1904.

Literature

Church History

It is a common experience, when one has spent considerable time in a particular study, to wish that a good manual of introduction to the science had been placed in his hands at the beginning, by whose counsels he might have been spared useless labor and have achieved larger and more reliable results. Such an introductory handbook should tell just what the science is, its purpose and scope, the methods to be pursued in its study and the temptations to be avoided, and if possible add a brief history of the science and a view of the present state of inquiry. To supply such an introduction to the study of Church History is the design of the brief but excellent manual of Mr. Collins.* He views Church History rightly not as the story of an isolated section of human life, an affair of clergy and councils, but as "the spiritual side of universal history," the observation of events by one who is interested chiefly in their religious bearing. With this broad view of the function of Church History is united insistence upon thorough scientific method, critical use of the sources, constant reference to first-hand authorities, and absence of partisan bias. The excellent advice is given, not simply to read general works, but to take a particular subject or problem and make it a hobby till one has made himself master of it and can speak as an authority. The suggestions how to do this are full of common sense, and both the chapter on the choice of books and the bibliography will be found helpful. It is not often that a book of such brief compass has so much value.

It is impossible to think of Canon Henson, who has stirred such controversy recently over "the future of the Bible," and who advocates in season and out and with many an appeal to history the Anglican recognition of non-conformists, as the non-partisan man of research, shunning all history with a purpose, who is Mr. Collins's ideal. And, in fact, Canon Henson states frankly in this volume† that he was influenced both in choice of subject and in treatment by present problems in English Christianity. Yet it cannot be said that his treatment of either Laud, or the Puritans, or the Presbyterians is unfair, and in his presentation of Erastianism especially he shows the genius of an historian. His chapter on "The Presbyterian Experiment" should be read by those who are in the habit of indiscriminate praise of the men of the Westminster Assembly.

The life of John Robinson, the Pilgrim pastor,‡ is confessedly the work of an admirer and spiritual descendant, and is none the worse for it. The biography is evidently the product of thorough and careful study, and the material is well presented. Mr. Davis finds that the famous Farewell Address, which we know only from Winslow's report, written 26 years after its delivery, was nevertheless "correctly reported for substance of doctrine." Robinson is presented as the commanding and forceful personality, who, after others had failed, brought to success the ideal of freedom in Church Government, and set it on its way as one of the permanent institutions of the world.

Japanese Physical Training

General attention has been attracted lately in this country to *jiu-jitsu,* that curious product of Japan which is an odd combination of wrestling, boxing and mauling, in all respects the most satisfactory system of rough and ready self-defense yet devised—satisfactory, that is, if we abandon certain innate and inbred ideas of fairness peculiar to the Anglo-Saxon. Almost miraculous stories have

* The Study of Ecclesiastical History. *By William Edward Collins, B.D.* New York: Longmans, Green & Co. 90 cents net.

† Studies in English Religion in the Seventeenth Century. *By H. Hensley Henson, B.D.* New York: E. P. Dutton & Co. $2.00 net.

‡ John Robinson. *By Ozora S. Davis.* Boston: The Pilgrim Press. $1.00.

been circulated of the deeds of the small brown men who practice the system. So widespread and real has the interest become that it is reported that President Roosevelt has recommended to the authorities who train our middies at Annapolis that *jiu-jitsu* be taught them as a necessary part of their physical education.

It is, then, with some pleasure that we note the appearance of an able and authoritative book* which treats this subject in an interesting manner. We may say authoritative, for the author, H. Irving Hancock, has spent much time in extensive travels in the Far East, and has specifically given seven years to the study of *jiu-jitsu,* even journeying to Nagasaki to learn the art under Inouye San, instructor of *jiu-jitsu* in the police department of that city. Mr. Hancock knows whereof he speaks; and it is a marvelous story he unrolls before us.

Until a very recent date the destinies of Japan were in the hands of a small caste of men, the *samurai.* These formed a sort of grim feudal knighthood, proud, exclusive and very capable lords of the land. Their numbers were small and their enemies, the "commoners," were numerous; they were compelled to rely largely on physical force to maintain their social position. Roughly speaking, about two thousand years ago some member of the *samurai* discovered that "by pressing the thumb or finger against certain muscles or nerves momentary paralysis could be produced," also that "by employing the edge of the hand to strike a piece of bamboo at a certain angle of impact he could break the stick." The possibility of employing both these means to cripple or incapacitate an enemy was realized by the *samurai;* new tricks were discovered and added, and *jiu-jitsu* was evolved.

During the course of two thousand years the various tricks have crystallized into a definite system, adding to themselves a series of preparatory gymnastics to harden and make facile the peculiar muscles needed for the exercise.

So important in Mr. Hancock's mind is the purely preparatory side of the work that he has written another book, devoted to this side of the subject as applied to women.† As an ardent *jiu-jitsu* enthusiast, Mr. Hancock claims that great results would ensue were gymnastics such as he describes generally practiced. He presupposes, however, an almost vegetarian diet and no corsets, conditions of attainment perhaps too difficult for our average women.

For both boys and girls the same systems of exercises with the necessary modifications is recommended,‡ and Mr. Hancock has issued a manual for use in homes and schools, illustrated, like his other books, by photographs of the desired positions. The Japanese system of gymnastics differs from occidental in being based upon wrestling. The struggle between two antagonists in some form is an essential feature.

Poetry

THE output of verse continues about as usual. There is a score or so of rubbishy volumes to one that is in any way interesting or significant and a few which are not particularly important perhaps, on the whole, but which contain one or two good pieces. It is to this class that we wish to call attention at present in hopes of rescuing a little meritorious verse which might otherwise be overlooked.

From the Western coast there comes every now and then a creditable volume from the press of A. M. Robertson. This time it is a collection of "Visions and Other Verse,"§ by E. R. Taylor. Dr. Taylor's work is distinguished by considerable mastery of language and command of thought. His verse is reflective and mature. But he is a poet on lines laid down by others, and lacks the last gift to find form and expression for the still unreduced elements in the atmosphere. The following Shakespearean sonnet on Charles Lamb will give a very fair idea of his poetic ability and perception:

"Ah, many a year has fled, dear Lamb since thou
Tasted the bitter and the sweet of death,
But love thy name has nurtured so, that now
As scarce before, it greenly flourisheth

† PHYSICAL TRAINING FOR WOMEN BY JAPANESE METHODS. *By H. Irving Hancock.* New York: G. P. Putnam's Sons. $1.25.

‡ PHYSICAL TRAINING FOR CHILDREN BY JAPANESE METHODS. *By H. Irving Hancock.* New York: G. P. Putnam's Sons. $1.25.

§ VISIONS AND OTHER VERSE. *By E. R. Taylor.* San Francisco: A. M. Robertson. $1.50.

Thou hadst sincerity without a flaw,
And lovedst all so deeply and so true,
Thou to the beggar and the sweep couldst draw,
And see their hearts, their rags and tatters through.
Thou hadst no theories for wayward man,
Nor sought to teach some lesson to thy kind,
But livedst patiently thy little span,
To hopeless ills courageously resigned.
Thy writings leave us debtors evermore.
But what thou wast makes still the richer store."

"A. E." (George William Russell) has another set of pieces† strongly marked with Celtic wistfulness and illusion. There is a strangely lulling melancholy about these languorous rhythms, something at once soothing and disquieting, like the ceaseless agitation of the sea:

"When twilight flutters the mountains over,
The faery lights from the earth unfold;
And over the caves enchanted hover
The giant heroes and gods of old.
The bird of ether its flaming pinions
Waves over earth the whole night long:
And stars drop down in their blue dominions
To hymn together their choral song.
The child of earth in his heart grows burning,
Mad for the night and the deep unknown;
His alien flame in a dream returning
Seats itself on the ancient throne."

Nor would it be fair to omit in this connection Miss O'Reilly's "My Candles."‡ Miss O'Reilly, who, is by the way, the daughter of John Boyle O'Reilly, is rather too anxious about the teaching of her fables; she is far too eager to adorn her tales with moral pendants, whose obviousness is ill redeemed by their neatness. But, in spite of this officiousness, she strikes at times a right lyric note, as witness the verses called "Thy Grave, and Mine:"

"When thou art dead
What friendly tree would'st thou have grow
Above thy head,
That this forgetful world may know
Here lieth one who hath outwitted woe?

"A sturdy oak?
But oaks are for the white-haired sage,
Since sober cloak
And rugged bark are fit for age
That hath endured a time-worn pilgrimage:

"No—'tis the beech
That thou must choose. Its rustling shade
This earth will teach,
There is such bliss as moon-lit glade,
Such ecstasy as plighted youth and maid."

† THE DIVINE VISION. *By A. E.* New York: The Macmillan Co. $1.25.

‡ MY CANDLES. *By Eliza Boyle O'Reilly.* Boston: Lee & Shepard. $1.00.

Nancy Stair. By Elinor Macartney Lane. New York: D. Appleton & Co. $1.50.

Those who read Mrs. Lane's novel, "Mills of God," are familiar with the "touchableness" of her literary style. She reduces sentimentality to a fine art and justifies it with heroines so adorable as to successfully challenge criticism. In that first story she won our sympathy and admiration for a lady whose conduct was out of keeping with the high morality of her character; and now she is lending the dove wings of her imagination to another irresistible coquet. Nancy Stair, the star maiden in this performance, is the daughter of Lord Stair, a minor poet, a friend of Robert Burns, and of every unfortunate beggarly soul in Scotland. Never was there a tender heart more lawlessly set upon doing good. Her very virtues were sweetly wanton, and her grace as original as Eve's. She studied law in order to circumvent it for the sake of her poor burn side people. She forged testimony to save her lover. She was ready to use all her feminine charm upon the most abandoned of men, if only she might achieve the ends toward which her own mercy carried her. It is, indeed, her relations to men that charm and delight us most. She has no sense of personal obligation to any save the poor and miserable; the rest stand waiting while she makes up her lovely mind which one she will accept for a husband. But at the very moment when we fear that the author's sentimentality will break into license, to the eternal shame of Nancy, that pretty creature shows her mettle in an agony of romantic disappointment over Burns, whom she loved:

"It took me but two weeks to discover that the thing we call genius has no more to do with a man's charactr than the chair he sits in; that a man can write like a god and live like the beasts in the fields . . . that he can write lines surpassing *aye* surpassing Polonius's advice to his son and leave them uncopied on an ale-house table to go off with the first loose woman who comes by, and be car-

ried home too drunk the next morning, roaring out hymns about eternal salvation!"

After this, we have more confidence both in the author and in Nancy. Altogether, it is a refreshing, wholesome tale, a tender memorial of a young poetess whose songs are still sung among the Highlands of Scotland.

Kwaidan: Stories and Studies of Strange Things. By Lafcadio Hearn. Boston: Houghton, Mifflin & Co. $1.50.

These are strange tales that our expatriated poet has collected under the title *Kwaidan,* not quite like English ghost stories; altho gruesome enough, they are not grotesque, as ours often are. Most of them "have been taken from old Japanese books," a few are of Chinese origin, retold with an added touch of imaginative grace by the Japanese story-teller. A pretty story of a Dryad, Aoyagi, or "Green Willow," tells how she was wooed and won by a traveling prince, and lived happily with him until she felt in her heart the stroke of the sharp ax that cut down a willow-tree on the mountain side, and fell with a cry at her husband's feet:

"There lay on the matting only the empty robes of the fair creature, and the ornaments she had worn in her hair: the body had ceased to exist."

Beautiful legends, some of them fancies as airy and iridescent as the clouds of butterflies that followed a Chinese maiden, mistaking her for a flower, "so fragrant and so fair was she." Others are as eerie as any tale of Poe or Hoffman. In the outline sketch "Mosquitoes" we find:

"I want to have my chance of being reborn in some bamboo flower-cup or Mizutamé, whence I might issue softly, singing my thin and pungent song to bite some people that I know."

Could he, by any possibility, mean his critics?

The House in the Woods. By Arthur Henry. New York: A. S. Barnes. $1.50.

Mr. Arthur Henry has written a wholesome, happy story of a dream made true. But dreams only come true when capable dreamers work for their fulfilment. Certainly two people who work in New York and pay for "clothes, food and lodging," taking "pleasures from the grab-bag," and save in three years seven thousand dollars, are capable indeed. One is not surprised to see their visions realized. These two smooth away seemingly insurmountable obstacles, and go to the mountain-farm of their hopes. All the workers in the city's din desire some day to turn their faces to the woodlands in search of a nesting place with the birds and the squirrels and the rest of the children of Nature.

"Sentiment is very much the same everywhere. In so far as a man feels it and yields to it, his dreams and longings are the dreams and longings of the whole world. This is why a poem becomes popular, a song journeys from lip to lip; why whole audiences weep and laugh together."

So with the desire of the woods in our hearts we follow joyously the story of the cutting of the sills, the building of the chimney, the digging of the cellar, the conquering of the garden plot. Better than all fiction is the relation of actual things. We weary of the tales of things that might be and hail with delight books with the bone and sinew of reality, the red blood of action, the soul in them of the actual. Not only did the two city folk find good neighboring with trees and brook and stones, but they learned the joys of living near in heart to those who live near in house.

The Story of King Sylvain and Queen Aimee. By Margaret Sherwood. With illustrations by Sarah S. Stillwell. New York: The Macmillan Co. $1.50.

Miss Sherwood will be remembered as the author of that pretty pastoral, "Daphne." This, her second book, is quite as delicately done. The story, told in the manner of the ancient chroniclers is of a king and queen, who, wearying of the strait walls of their castle, and the still straiter walls of etiquet that prison them, steal forth one night in disguise, and fare along the lanes like any peasant pair. For many weeks they wonder so, getting their food as the birds do; happy in their freedom and in one another's companionship, which now, for the first time, they may enjoy unvexed by watching eyes. At length the king builds with his own hands a lodge in the forest, and

here they live, never regretting the state and luxury they have left. Of course, in an allegory one must not insist upon practical considerations, so it will not do to inquire too closely how King Sylvain and Queen Aimée contrive to meet their household expenses. Enough that the theme is daintily conceived and wrought out, and that it will appeal to all who rebel inwardly against the restrictions of conventional life, and who long vainly to leave the beaten paths and to strike for the open trail.

The Yeoman. By Charles Kennett Burrow. New York: John Lane. $1.50.

"The Yeoman" has rural England for its scene, and its atmosphere is the atmosphere of conservatism and of deep attachment to the soil; a study of a class and of a sentiment which are typically English. In Richard Winstone, the central figure of the tale, Mr. Burrow shows what that sentiment may do when it is carried to the extreme. A striking character in this Winstone, a silent, brooding man, hard on the outside, but with a kernel of tenderness in him; nursing his love for the land inherited from his forefathers and his liking for the old ways till it becomes a monomania with him, blinding him to his own interests, making him quarrel with his best friends, and in the end bringing him to ruin. The love episodes of the book, which chiefly concern Winstone's daughter Dorcas, are not specially interesting. It is a pity, too, that Mr. Burrow weakens his story by the very ordinary expedient of killing off characters when they become inconvenient. Of course, Eustace Hamer, who persists in loving Dorcas, tho his father objects, and tho she loves her Cousin Ford, is a problem; and, of course, when Richard Winstone is old and broken he is best out of the way, that the author may marry Dorcas to Ford, from whom her father's enmity has kept her—and thus give the book a happy ending. The deaths of Eustace and of Winstone simplify matters, and one cannot say they might not have occurred. Yet one has a feeling that life very frequently does not settle problems in the same easy way, and that the author who does so somehow shirks his responsibilities.

The Horse-Leech's Daughters. By Margaret Doyle Jackson. Boston: Houghton, Mifflin & Co. $1.50.

The story of a selfish, soulless, tiger-cat of a woman with "yellow-brown eyes," who holds up her husband upon every occasion for the money he can ill spare, is not inspiring reading. This cat-like person dominates the book, and her greed, heartlessness and gross materialism are shameless enough without the added stain of crime, which the author might have spared us. Insanity, murder, treachery, desertion, automobile accidents, failure, divorce and immorality make a most unpleasing compound, a veritable witches' broth. Even the "good woman" of the story is too fond of dress, gambles in stocks and falls in love with the cat-lady's husband! As a picture of hideous materialism, of the sort of money-worship which is the root of all evil, the novel may have a gruesome interest for moralists—to most readers it will be simply revolting. Even the hero's resolve to keep faith with the faithless lacks power to warm the heart with generous admiration. It is not inevitable enough.

How Tyson Came Home. A Story of England and America. By William H. Rideing. New York: John Lane. $1.50.

This is a pretty good story, tho it would be better if it had been cut down one-half. When the author wants, for instance, to inform his readers that a character's mouth relaxed, he says, laboriously that "the corners of his mouth curled and showed that their metal could be warmed into malleability." This sentence, selected at random, is really much shorter and less polysyllabic than many of its fellows; but, despite its prolixity, "How Tyson Came Home" is not uninteresting. Tyson is a likeable character. He is a man who had come over from England as a stowaway in his boyhood, and had made something of a fortune in an Arizona mine; and at the time this story opens he is about to gratify an unreasoning admiration for everything English by returning to that country to spend the rest of his life. But after a brief experience of that country he finds that his real home is America, and his real homecoming is when he returns here.

Nona, the Arizona girl, whom Tyson marries, is a typical Western girl, the kind you are always meeting on the stage and in fiction. Her slang, her offhand ways, her ability to manage anything or anybody, from a bucking broncho to a band of striking men from her father's mine, will delight romantic readers who have never seen the West.

She That Hesitates. By Harris Dickson. Indianapolis: The Bobbs-Merrill Co. $1.50.

This story begins in truly Bohemian style at Dresden with a painted lady and a French soldier of Fortune playing the star *rôles*. But in the course of half a dozen chapters, the Czar and Crown Prince of Russia, a pretty Princess of Sweden and half the politicians of Europe are involved. The scenes shift to palaces, the painted lady becomes a formidable anarchist, the adventurer a gentleman, and prime ministers play the part of Cupid. Nuptial tragedies follow, of course, and the interest of the story depends upon the harrowing situations thus developed in the august bridal chamber or wherever the disaffected bride and groom happen to meet. Without showing more originality than the average historical romance, the book will prove entertaining to those whose fancy is caught by the old formula of intrigue, and whose literary taste does not resent the intrusion of much sentimentality.

Where the Tide Comes In. By Lucy Meacham Thurston. Boston: Little, Brown & Co. $1.50.

A story of modern Southern life which includes political, industrial, financial and social phases of the malady is unusual, to say the least of it; but that is what Mrs. Thurston has undertaken in her new novel. The scenes are laid at Portsmouth and Norfolk, Va., and she shows an intelligent appreciation of the dramatic material which the South affords. Yet from some cause, difficult to define, the book is not a success regarded from the standpoint of art. It lacks form, energy. It quickens in sections, and not as a whole conception. The admirable character interpretations, the situations, so well defined by local coloring, are offset by an inability to co-ordinate the different elements in the story. It ends sprawling, and not with the dignity that draws the curtain dramatically upon the final, logical conclusion of the whole matter. The climax is not a climax, but an incident. The young politicians, young sons of the modern South, are well drawn, but their politics are really foreign to the situation. The negro anarchist lacks the madness and courage to play his part. The mysterious young man disguised as a common laborer is so noble as to become almost ignoble in his forbearance. The women are singularly accurate representations of certain types, but one feels that they fail to acquit themselves with any distinction in the performance. In short, the book is written too much on the dead level. It lacks the aggressive power which makes issues and forces conclusions. Yet it is a move in the right direction. And it is the first serious attempt made to interpret what *is* rather than what *was* in the South.

A Norwegian Ramble. By One of the Ramblers. New York: G. P. Putnam's Sons. $1.20.

"A Norwegian Ramble" is a story of a brief vacation trip through Norway—over fjord, fjeld and mountain, across that interesting country of the Vikings. The party consists solely of two congenial spirits—a learned LL.D. and the ingenuous "Rambler," who tells of the trip in a style delightfully simple and full of charm. The descriptions of the country are full of life and color—of glorious sunsets, illuminating snow-covered mountain peaks, of brilliant rainbows and of gushing mountain streams. Brief stops at quaint inns on the wayside, as the trip progresses, give one a fair insight into the home life of the rugged Norwegian, and the human interest of the story is greatly added to by the "Rambler's" occasional chats with a rosy cheeked Norwegian maid of the inn. The shy satisfaction with which some of these advances are met proves that even the Norse maiden is susceptible to a bit of innocent flattery. The trip covers but a small section of Norway, but the freedom and peacefulness of the country it describes and the sturdy honesty of the

people appeal directly to the tired American in search of a restful vacation.

Old London Nosegay. By Beatrice Marshall. New York: E. P. Dutton & Co. $1.50.

This volume is well named. It is a prim, lavender-scented tale of London life during the strife in England between Puritans and Caveliers. Usually these romances are written by old beaus and discovered a century later by an enterprising publisher, but this time it is a lady's letters and diary that comprise the story. The difference in style and point of view is refreshing. She gives an impression of the trouble sometimes with the inconsequent air of a woman relating trivial gossip. Yet the incidents she describes now wear the blood marks of war and persecution. It is not seventeenth century London in perspective that is presented, but that London in life and reality.

Forty Centuries of Ink. By David N. Carvalho. New York: Banks Law Publishing Co.

This is a curious and uncritical compilation of information of all sorts relating to the history of ink, paper and similar means of writing, neither well arranged nor well written, but very likely useful for reference since so much material on the subject has probably never before been gathered together. The author is an earnest advocate of an iron gallo-tannate ink to insure the permanence of legal documents. Why should the author say graphite is "a carburet of iron?"

Literary Notes

In the "Religion of Science Library" (Open Court Publishing Company, Chicago) recent issues contain "Kant and Spencer" (20 cents), by Dr. Paul Carus, and "An Inquiry Into the Psychic Powers of Ants and Other Insects" (50 cents), by Dr. August Forel.

....Prof. Frederick Starr, the anthropologist of the University of Chicago, has published the narrative of his journey to Yezo to obtain "The Ainu Group for the St. Louis Exposition" (Open Court Publishing Company, Chicago, 75 cents). Altho the book is neither large nor profound, anything is of interest concerning this obscure family of the white race which has fallen a victim to the "Yellow Peril."

Pebbles

Evolution.—"What's become of that literary lion you had out here last summer?" "Oh, he made a monkey of himself by marrying an old cat."—*Chicago Record-Herald.*

...."My Dear Sir," wrote the editor to the persistent young author, "in order to simplify matters somewhat, we are inclosing a bunch of our 'declined with thanks' notices. If you will put one of these in an envelope with your manuscript, and mail it to yourself, it will make it easier for all of us, and you will be saving something in postage as well."—*Chicago Evening Post.*

....Sang of Nero.—A school teacher at Three Rivers asked her pupils the other day who Nero was. The only response came from a little fellow who held up his hand. "Arthur," said the teacher, "do you know who Nero was?" "Yes, ma'am," he answered proudly, "he's the one we sing about in our Sunday school." The teacher was unable to recall any song in gospel hymns where Nero was mentioned. "What is the song like, Arthur?" she asked. "Nero, my God, to thee," was the answer given by the child.—*Detroit Journal.*

....Important Literary Discovery.—The following item was lately published in The Independent: "Some of our exchanges are publishing a curious item to the effect that a horse in Troy pulled a plug out of the bunghole of a barrel for the purpose of slaking his thirst. We do not see anything remarkable in the occurrence. Now if the horse had pulled the barrel out of the bunghole, and slaked his thirst with the plug; or if the barrel had pulled the bunghole out of the horse and slaked his thirst with the plug; or if the barrel had pulled the bunghole out of the plug and slaked its thirst with the horse; or if the plug had pulled the horse out of the barrel and slaked its thirst with the bunghole; or if the bunghole had pulled the thirst out of the horse and slaked the plug with the barrel; or if the barrel had pulled the horse out of the bunghole and plugged his thirst with a slake, it might have been worth while to make a fuss over it." The authorship of this, which has heretofore been variously credited to Frank Stockton, Julian Hawthorne, Mark Twain, Dean Swift, Laurence Sterne, Chaucer and Noah, has now been definitely traced by Mr. Frederick M. Smith, of the *Woman's Home Companion*, to Adam. Mr. Smith was, it seems, well acquainted with the author, having attended Oxford with him, and has many of his letters identical in style, by means of which the identification has been made certain. Mr. Smith is naturally very much pleased with his discovery of the authorship of this fragment dating from prehistoric literature, the importance of which will at once be recognized by literary savants.

Editorials

Judge Parker on Philippine Independence

No more farcical issue can be raised between the supporters of Mr. Roosevelt and those of Judge Parker than that of independence for the Philippines. It is not in the least a practical question. Everybody knows that it is impossible at present, and likely to be impossible for a long time to come. Were Judge Parker elected President, and were the Democrats to hold the House and the Senate for his one term, or even two or three terms, no action of the sort would be thought of. It is a dead issue, only resurrected and galvanized to create the pretense of an issue between the parties.

Judge Parker's address in response to his formal notification treated the matter fairly. It said, what every intelligent man says, simply that we should give self-government to the Philippines as soon as they are ready for it. We doubt not that he understands the meaning of words, and used them as he did with a purpose. He said exactly what President Roosevelt had said in his acceptance as to self-government, and he said nothing more about independence. But his less sane adherents, those who are hunting snarks, boojums and bugaboos, the monocular and oracular Anti-imperialists, were not satisfied and demanded a clearer statement; and, most amazingly, Judge Parker has given it. That he should have so easily been hooked makes us inclined to believe the claim that his famous telegram to the St. Louis Convention was sent at the urgency of Mr. Pulitzer.

Judge Parker says in his letter that when he said self-government he meant independence. Did he not know the difference? Did he not then know what the Anti-imperialists were baying after? Or had he paid no more attention to them than have the rest of the country? But now he adopts the Bostonese term, and must be taken at its meaning, even altho, were he elected President, it would not be difficult for him to say that he only meant such independence as Canada and Australia claim to possess.

Judge Parker's letter has given Secretary Taft an opportunity to discuss the subject briefly but conclusively in his address last week at Montpelier, Vt., from which we make some extracts in our "Survey." What rights of life, liberty and property are denied to the Filipinos? What kind of a despotism is it, in which they administer their own municipal governments, have co-ordinate share in their provincial governments, have three members in the central governing Commission, and in two years will possess a co-ordinate branch in their Legislature? Four years ago they possessed not one political right; they were slaves, under an absolute tyranny. In four years this has been done, what no other nation on the face of the earth governing an Oriental people has begun to do in centuries. And hunters of snarks are crying out because President Roosevelt does not throw a naked infant into a rattlesnake's den.

We are sure that Judge Parker—for we believe better of him than his word—proposes himself to let the infant grow, so that it can handle a club, before it is allowed to meet the rattlesnakes. He only promises by-and-by, when they are fit for it, to give them independence, perhaps in four years, perhaps in fifty years, perhaps after as long as it will take England to keep her promise to evacuate Egypt. Meanwhile, he will, like President Roosevelt, rule them "without the consent of the governed." But what becomes of the Constitution and the great principle meanwhile? The principle is violated if independence is denied for five years. It is no principle at all as interpreted by the St. Louis platform. Our business is to do the best we can for the people, and let them get progressive self-government just a little faster than they are prepared to exercise it. By-and-by, says Mr. Taft, they may be fit for absolute independence and want it, and President Roosevelt would be willing they should have it, or they may prefer

that kind of independence whch satisfies Canada and Australia. Meanwhile they are in a process of education, and the luckiest people in all the East, always excepting Japan.

The Ethics of Law-Breaking

When, where and how may an upright citizen without moral guilt deliberately disregard and violate the laws of the State to which he owes allegiance? The question is not academic. It always has been, and perhaps it always will be, intensely practical.

Religious prophets and ecclesiastical dissenters in all ages have been criminals for conscience's sake. Peasants and craftsmen, crushed by unendurable taxation, have defied civil authority, and, like the insurgents that followed Watt Tyler to Smithfield, have compelled kings to define their rights. Revolutionists, like the American colonists in 1776, have taken the redress of grievances into their own hands. Outraged humanitarians have aided fugitive slaves to escape. The story of history would lose much of its dramatic interest if the chapters on conscientious law-breaking were cut out.

Yet civilization itself is imperiled when respect for law declines. Social order cannot permanently be maintained by *Vehme Gerichte* or the lynching mob. Where, then, is the line to be drawn between the law breaking that is morally right, or even a duty, and that which is reprehensible and socially disastrous? How is the upright man to decide in doubtful cases? How, for example, shall we class the conduct of the "better elements" in Colorado? Have the high-handed methods that they have employed to quell intolerable labor disturbances been right or have they been wrong?

Nor is it only when the law is being used—or misued—in the interest of iniquity that our question demands answer. In the everyday affairs of a humdrum existence most of us are answering it in our ordinary activities. America is a land in which the people are supposed to make their own laws, and yet it is doubtful if in any one of our commonwealths ten men in a hundred could be found that have not at some time or other committed criminal acts. The churches of New York City would all be empty for at least one day if the builders that have violated the building ordinances, the landlords that have violated the tenement house and Board of Health rules, the merchants that have illegally obstructed the sidewalks, the automobilists and bicyclists that have violated the speed regulations, the housewives that have had their rugs illegally beaten in the back yards, and the tender-hearted ladies that have thrown crumbs to English sparrows, were all sent to jail for over Sunday. Our courts would go out of business if all of the lawyers and judges that have aided and abetted law breaking by buying beer or whisky in the State of Maine, or by having alcoholic beverages served to them in teacups while rolling through Ohio in Pullman dining cars, were some day to say: "We all like sheep have gone astray; let those that are without guilt henceforth sit in judgment."

It is not with any sense of superior wisdom, but only because we have "happened to think of it," that we venture to call attention to a cardinal principle of the law itself, that possibly affords some slight guidance upon this difficult matter. That principle is embodied in the rule that when a court of last resort renders a decision, the law thereby affirmed not only is now but has been law in the past, contrary decisions by courts of lower jurisdiction to the contrary notwithstanding; and contrarywise, an alleged law finally declared to be no law has never been law. The rational conception involved in the rule is that of law as the *abiding* will of the sovereign—be that sovereign a monarch, a class or a people—in distinction from the whim or conceit of any group of men that mistakenly set up their own momentary judgment as an expression of the sovereign will.

We suggest that here is a hint for the rational guidance of conscience. Law, as everybody knows, is made up of two great bodies of rules, different in character and of different origins. One is that mass of jural traditions affirmed by the courts, and known as the common law. This law with amazing completeness embodies moral judgments that have borne the test of human experience for almost unnumbered ages. There is

always a tremendous presumption in favor of its essential rightness, and the conscientious man should think more than twice before setting up his individual judgment in opposition to it. In many points of detail it needs re-formulating to meet the requirements of each new generation, but the burden of proof rests upon the innovator.

The other part of law consists of statutes made by legislators, some of whom are wise men, some of whom are good men, many of whom are fools, and not a few of whom are scoundrels. Unhappily, there is never any presumption that a statute enacted by a Legislature expresses either the conscience or the good sense of the community, and a large part of the work of every legislative session consists in repealing the fool enactments of its predecessors.

We would not have our readers infer that we think that while they are morally bound to obey the common law they are morally at liberty—tho at their legal peril—to disobey the statute law. We only invite them to reflect upon this proposition—namely, that the conscientious citizen is morally as well as legally bound to obey *law*, that law which *really* is law, the higher, the highest law; that he is not morally bound to obey any alleged law which, in a juristic sense of the word, is not really law at all, because not really emanating from the mind, the conscience, the abiding will of the sovereign people. So far as his civil responsibility is concerned, he must accept the expert decision of the courts of last resort as to what is law and what is not. So far as his moral duty is concerned, he must consult also his own conscience and his own reason. In such cases Peter and John suggested a good and well worn principle, many centuries ago, reaffirmed and formulated fifty years ago by William H. Seward.

Postal Savings Banks

SEVERAL propositions have from time to time been laid before Congress for the establishment of a department of the post office where the savings of the people could be deposited with absolute confidence of security. Senator Quay was preceded by Senator Chandler, of New Hampshire, and Senator Mitchell, of Oregon, in the advocacy of some such measure. Their arguments may be summed up as follows: In general, such a department, by its absolute safety, would stimulate the laboring classes in habits of saving. It would withdraw from hoarding a very large amount of money, and put it into active circulation. Political economists estimate that there is not less than seven hundred millions of dollars constantly hid away, and so retired from active use in business. It is urged, further, that the probable deposits would reach the sum of one thousand millions of dollars inside two years; and that this could be used to retire Government bonds—causing the debt of the country to be held by its own citizens. Others lay special emphasis upon the moral influence of such banks in elevating the habits and character of the laboring classes. The credit and stability of the Government would at least rally to its defense every person who had a deposit in its banks.

As long ago as 1881 Postmaster-General James said, in his annual report:

"It is my earnest conviction that a system of this description, if adopted, would inure more than almost any other measure of public importance to the benefit of the working people of the United States."

Postmaster-General Wanamaker, in his successive reports, constantly urged postal savings banks as consistent with good business principles, as well as the public interest. He took the ground that the Government ought to extend to its twelve or fifteen millions of wage workers absolute protection for every dollar earned. He proposed that the Secretary of the Treasury should have charge of the deposits; putting the money into circulation by offering the funds in each State as a loan to the national banks; and that the same should be declared trust funds. Postmaster-General Gary, in his report for 1897, said the greatest advantage from postal savings banks would be the teaching of thrift and economy:

"The boys would deposit in such banks. They would be a school for the teaching of thrift."

Post office savings banks, where money is received for Government use at low rates of interest, are in operation in nearly every country in Europe, in Great Britain and all her Dependencies, including Canada and Australia. It may not be known that such banks are in operation in one territory of the United States—that is, in little Hawaii. In Great Britain there are nearly eight millions of depositors, having about six hundred millions of savings in postal banks. In Hawaii during ten years ten thousand depositors saved nearly one million of dollars. In Canada the deposits of twenty years reached nearly twenty-five millions. These large accumulations have been made under conditions of absolute safety, and with positive advantage to the Governments.

In England any one can become a depositor who is over seven years of age. It is only necessary to ask the postmaster for a depositor's application, when any sum not less than twenty-five cents can be placed on deposit. A depositor's book is then made out, and he can deposit whenever he likes, with credit on his book. The local office reports at once to the London office, and the London office reports to the depositor. Even smaller sums than twenty-five cents can be deposited by the purchase of stamps. Persons under age cannot make withdrawal without first going before a magistrate, with parent or guardian, showing good cause for such action. The reason for this restriction is that the Government wishes minors to become habituated to business habits, and to begin life with a bank account.

Purely as a matter of business, postal savings banks have proved very satisfactory wherever they have been tried. Great Britain earned a surplus of $80,000 per year on deposits of $500 000,000—paying two and a half per cent. interest on over 6,000,000 of accounts. France has regularly made a neat profit, handling between two and three millions of accounts. Torn up constantly by her city population, her agricultural population is the safest in Europe and the most thrifty; and it is these small farmers who hold most of the deposits in postal saving banks. Austria introduced these banks as long ago as 1868, and Belgium in 1869. In both these countries they are held to be substantial parts of financial prosperity.

Mr. Wanamaker did not state the case too strongly when he said that the United States constituted an irrational exception to the political economy and business principles of the whole civilized world. He urged that the agitation which had gone on already for a quarter of a century, especially on the part of the common people, should be favorably considered by the Government. Postmaster-General Gary suggested that there could be only one serious objection to such banks, and that would be the amount of money placed in the hands of the Government:

> "If we were still in the faith of Hamilton and Benjamin F. Butler, that 'a national debt is a national blessing,' this difficulty would be serious; but the people no longer believe in that doctrine. We could very patiently see our finances in the condition that they were under Gallatin—the national debt wiped out, or the bonds held entirely by our own people."

He believed our industrial evolution had scarcely begun, and there would be State bonds and other securities always at hand. We have about eighty millions of population, but with properly encouraged agriculture the country can support at least five hundred millions.

We see no reason for refusing any longer to place the United States in tally with the leading nations of the globe. Postal savings banks are not an experiment, nor would their establishment come under the head of paternalism. But for some reason our Post Office Department is growing less enthusiastic about improving its service. Postmaster-General Payne informs us that in his judgment the handling of merchandise by the post office is "an infringement on express business!" The Fourth Assistant desires to confine free rural mail delivery to "mere correspondence." There are still seventy-three thousand American towns left without free delivery. The whole civilized world has postal sav-

ings banks—except the United States. Every civilized nation has parcels post, domestic and foreign—the United States excepted. We are at a disadvantage in comparison with Canada as well as Europe. The Post office system of the United States, instead of being to-day "the simplest mechanism ever devised for human advancement," is a disgrace to the Federal republic. It is inferior to that of England, Germany, France and Austria. We cannot escape the conviction that it must be revolutionized.

A "Monstrosity"

On August 13th *L'Osservatore Romano* had a leader inspired beyond doubt by high authority. Its purport is to show that the separation of Church and State is unwelcome; that the two powers should move on hand-in-hand, distinct but not apart. Without such union the Church would wither.

The writer goes on to say that the doctrine of the separation of Church and State was condemned in the Syllabus. The Holy See has no wish to see such a status in Catholic States; much less can it be a party in an outcome so contrary to its apostolic and civil functions. Rome much prefers to yield to pressing needs, provided purity of faith, morals and ecclesiastical discipline suffer no shock. Pius VII, in signing the Concordat with France, followed this view.

The Church—concludes the leader—cannot of itself refuse to live in agreement with the State. The idea of separation is "a monstrosity, which must be fought with energy."

French newspapers, such as *Le Matin*, see in the foregoing "possible concessions." Rome, it seems, will try now and heal the breach with France. But this is probably too late.

To American Catholics, however, the fresh restatement of the Syllabus should bring some reflections. A free Church in a free State is condemned. This ban is told the world amid the death throes of the French Concordat. The status in France is lawful, the status in the United States is outlawed—*i. e., de jure*. In the eyes of canon law, the Church in the United States is an outlaw, while *de facto* American Catholics are constantly receiving apostolic benedictions, visits of Roman cardinals, etc. Curious anomaly!

The lawful status in France witnesses the Bishop of Laval declaring that he is under two authorities. By one—Rome—Monsignor Geay is suspended and barred from all priestly or episcopal functions. By the other—France—he is recognized as a Government official, dwells in the See-House, draws his salary. Without Monsignor Geay Rome can do nothing in Laval, just as without him also the Quai d'Orsay is helpless in the same diocese. True, Rome may remove him, but only with the Government's consent. True, also, the Government may turn him out, but not without Rome's approval. Such *L'Osservatore Romano* calls, "apostolic and civil functions." Moreover, all this is positive law—*Jus Publicum Ecclesiasticum*. Among us, where the Pope can make and unmake bishops, the status of the Catholic Church is non-law, rather than outlaw, and the Jesuits would probably add *heresy*. The Papal organ calls it a "monstrosity."

Japan, the Philippines and India

Japan and the Philippines are, we believe, no menace, but they are a very serious lesson to India as well as to China. No man who seriously considers the future of China can fail to see that the development of Japan must insure a new similar civilization also for China. But quite as serious is the bearing of the new conditions on India also. And India is thinking of the Philippines as well as of Japan.

The people of Japan, the Philippines and India are Asiatics. There is some difference in their races, but they all recognize an Asiatic fellowship. We generally speak of the Chinese as pure Mongolians, pure as races go. The Japanese are also mainly Mongolian, and closely fraternize with the Chinese. The people of the Philippines are a mixed race, Mongolian, Malayan and we know not what. The people of India are of all races, Mongol, Malay, Aryan. But they are all neighboring Asiatics, races of long history and record of pride and con-

quest; yet races that have felt the defeat and submission which Western civilization has been able to impose, but which Western nations will not be able to maintain when once the Western science and culture and power have been achieved by their millions. Already Japan has achieved them, and she is not afraid to match her force with the force of the Colossus of Europe.

It is now clear that China is sure to take a lesson from Japan, and Japan is glad to teach her. A short generation will make China the mightiest, as she is the most populous, nation in the world. Japan and China together will in a few years be able to resist the united Powers of Europe, which have seized cities and harbors and forts in her territory. China will be quick to learn Japan's lesson. The whole empire is yeasty with effervescence.

But not China only; there is India, and India is becoming a most anxious problem. The people of India are thinking much of Japan, but also much of the Philippines. Racially they feel closer to the Filipinos than to the Japanese, for they are more brown than yellow. And if Japan has maintained her own independence and has conquered her own liberty of self-government under constitutional forms, the self-government so rapidly granted to the Philippines is a nearer lesson to India, for the Philippines have been much longer under Western rule than has India. For three hundred years did the Spaniards hold the Philippines in an absolute sway which allowed the people no part in their own government, while the south of India has been held by Great Britain for only a century and a half. Yet to these long conquered Filipinos, now under the tutelage of the United States, we are giving local self-government, the right of choosing their own municipal rulers, and we have promised them very soon a developing territorial government, an initial Parliament, following the norm of our own free government.

This is something that is new, utterly new, in the rule of the subject races. There is nothing like it in India, and it is revolutionary. We never thought of it, we simply did what we had learned was right, and what recognizes the inherent rights of men, and it did not occur to us that it might disturb the policies of the rule of neighboring people. When Ucalegon's house is on fire it is time for Anchises and Æneas at the next door to flee; and when the subject Philippines are aflame with liberty it is time for England to expect a similar liberty to be demanded in India.

And such is the demand. The intelligent and ambitious Hindus are pointing equally to Japan and to the Philippines. Their journals, their public meetings, their men of influence and wealth are speaking with great freedom, and are constantly bracketing together the examples of Japan and the Philippines. They ask, Why should not the ancient, cultivated, educated people of India be allowed the same self-rule that the Philippines are having? It does not occur to them that we are a tyrannical Power, exploiting the Islands for our own selfish greed; they quote President McKinley and President Roosevelt and Governor Taft, and they tell the story of the transfer of control from the military to the civil power, and then the rapid granting of local self-government, and the promises of larger liberty, and they inquire why India should not ask and even demand the same freedom. They do not ask for political independence, but they do ask for their rights in the government of their country, and they ask if they only, among the races of the world, are too servile and feeble to claim their rights.

This England ought to understand and provide for. We fear that the Viceroy of India does not understand what the fermentation means.

And yet some Englishmen do understand in a measure. In a late address before the London Indian Society Mr. William Digby declared that "a free and self-governed India was attainable, if Indians were wise to discern and act," and he thought that could be carried out by a constitutional revolution in ten years' time. It was recent events in Japan and the Philippines that inspired his address. He quoted President McKinley:

> "The Philippines are ours, not to exploit, but to develop, to civilize, to educate, to train, in the science of self-government."

Accordingly we began our rule in the Philippines by putting three Filipinos in

the Governor's Council. Says Mr. Digby: "There has never been an Indian in the Viceroy's Council." Such a paper as *New India,* edited by natives of India, represents and urges that England must follow our example, and it does not weary of showing the contrast of American generosity with the British fear that any slackening of the rule will encourage the people of India to rebellion. If you would teach a people good will you must show your faith in them. Our method will make the people of the Philippines hold to us from love; the British way, when education has once come, will hold the people of India only by fear, and that not always.

Liberty and Unions

THE "free workman" is a favorite battle cry of the attack on labor unions, it being understood that the free workman is the one who asserts his independence, refuses to join the union and makes his own bargains with his employer. Whether or not there are such workmen who are really free depends on circumstances, but there are many for whom the unions can justly claim that liberty comes only through unionism.

A workman, whose identity we will protect by calling him Stein, was for 20 years in the employment of a firm belonging to a great combine controlling practically the entire output of its product in the United States. Stein is a quiet, industrious, unusually intelligent, but rather timid man, who had begun work at eleven years of age and gradually been advanced to the highest position in his trade as a workman, where he could earn $4 a day. His theory of life was wholly individualistic. He had no sympathy for the man out of work. Unions, he often declared, were only for those who would not work at their best, and any man who would keep sober and attend diligently to business would be able to take care of himself. So he stood aloof from the unions that came and went, and at one time was "whipped for scabbing." Finally he joined the union. Such a convert ordinarily would be a faithless recruit, but Stein soon learned another lesson.

One day he came home from work pale and trembling. "I've got it already. I've been discharged because my right hand trembles. I have worked for the firm for 22 years, and now I am thrown out like a worn out tool, with no more consideration than a cog in a great machine. I am only 35 years of age, and on the down road. I have done my best work, earned my best wages, and am an old man in the labor world."

The union took up the matter. The shop steward went to the foreman, denounced him for his cruelty and demanded his reinstatement. The foreman acceded, and Stein has been at work in his old place for two years, giving entire satisfaction. He now says, "The union has raised our wages 25 per cent. But that is the very least it has done. It has reduced our output 25 per cent. Formerly I would go to work at seven o'clock, and by quarter past seven would be covered with sweat and would keep that up until I went home at night, often working overtime. My health was fast breaking down. Now it is a pleasure to work. But the greatest gain of all is the personal independence, the feeling of security and knowing that you do not stand alone, and that is worth another 50 per cent. The foremen now have respect for the men. We can go directly to the superintendent or the head of the firm. There is no more favoritism, nor driving, nor cursing, or whistling at a man. The union is unpopular with the few men who were favorites, but it is popular with the others. Do you think the Colorado situation will come up in other places?"

Stein is now one of the stewards in the shop, representing the other men in their grievances, and the superintendent says that the union is improving because conservative men are coming into the offices. Those who know Stein can see that the union has made him free.

The Czar's Gifts

We regret that the gifts to the Russian people, presented by the Czar in gratitude for the birth of a son, do not greatly impress us. What was hoped for, the only gift that would represent real amelioration, was some measure of self-government, possibly even a constitution with representation. There is nothing of this sort,

and the people will be disappointed who know enough to be disappointed. What is given? Not a restoration of its constitution to Finland, but remission of fines; so for the Jewish communes, remission of fines of those who had evaded military service; so for Poland, remission of arrears in land purchase; also for Finland, amnesty for those who have emigrated without permission—and who do not want to return; also for Finland, a fund to help landless people; also amnesty or pardon in a number of civil and political cases. But none of these favors touch any evil. They simply salve an open sore. Russia needs what will reach the root of her trouble, relief from the autocracy, which the Autocrat does not propose to relieve. Indeed, how can he be expected to? Autocrats wait till they have to before they yield anything to the people. They may give the people favors, as grants of good will, but not as rights. That requires violence, as in 1776 or as in 1848. It is to be hoped that the result of the war with Japan will compel attention to the demands at home.

Trading Finland for Ireland

Now while the diplomats of Russia and Great Britain are arranging a treaty between the two countries providing for their closer friendship and the maintenance of peace, we wish to suggest to them a plan, which perhaps they have not thought of, but which would be of great benefit to both countries by relieving them of discontented territory—that is, to exchange Ireland for Finland. There can be no doubt the change of allegiance would be enthusiastically welcomed by both Irish and Finns. It could be easily proved by quotations from the speeches of Irish patriots and the writings of Irish editors that the British Government is more tyrannical than that of Russia. At a meeting last winter in this city when William Butler Yeats gave an address on Robert Emmet, the platform was overhung with entwined Russian and Irish flags, and cheers for Russia and hisses for England and her ally Japan came from 5,000 Irish throats. On the other hand, the Finns would be glad to swear off Nicholas II and on Edward VII. There is no compulsory military service in Great Britain, and Finnish professors and ministers could say what they pleased without being banished or imprisoned. The arrangement would also be mutually advantageous to both the governing powers. We often hear Englishmen say that they wish Ireland were sunk to the bottom of the sea, but we hope this project will not be carried out, for it is better to trade off undesirable property than to destroy it. It would be a relief to Russia, for it is going to cost something to keep Finland in governors, for the office is one which must seek the man, and the Czar will have to make frequent visits to the Employment Bureau. The exchange of Finland for Ireland would give Russia her long desired access to the open sea and England a dominant position on the Baltic. The peace of Europe would be established, because both powers would have, as it were, exchanged hostages.

A New Day in Georgia

The last session of the Georgia Legislature lasted well into August. It deserves especial credit for its record on education. As at first proposed the bill called for a round one million dollars by direct levy for the public or common schools. Pending the passage of the measure this amount was cut to $800,000 by the Senate. When the matter got before the House again the amount was fixed at $900,000; but when the question came up for final passage on the last day of the session, after the appointment of a conference committee and a short, sharp and snappy debate on the minority and majority reports from this committee, both houses of the Legislature agreed that the appropriation for the schools should stand as originally reported—*i. e.*, at $1,000,000. This was a notable and praiseworthy step on the part of Georgia's law makers, and is deserving of the praise of good people everywhere. We are among those who hope that it means a new day in Georgia, so far as the education of the masses is concerned. By this act of the General Assembly the common school fund will be increased by an

amount aggregating upward of $350,000. The *Atlanta Constitution* places the increase at $360,000, and one of the Senators, in discussing the bill on the last day, said that the increase would aggregate $386,000. At any rate, the common school fund has been increased more largely by the action of the recent Legislature than in any other single year in the history of the State. It is hard to give the exact amount of increase, because the school fund is made up by direct levy and by amounts coming into the State treasury from what might be called indirect sources. For instance, the income to the State from the hire of convicts by the new law which went into operation on April 1st, 1904, will be increased nearly $135,000. Poll taxes will also be largely increased, this being the year of a Presidential election. So that, all told, there will be something like $1,900,000 for the State School Commissioner and the State Board of Education (which board came into being a little more than a year ago) to apply to common school education in Georgia for the year 1905. In 1888 the late Dr. J. L. M. Curry, who was then the General Agent of the Peabody Fund, addressed the Georgia Legislature, and made a strong plea in favor of free public schools. At the conclusion of his address the House appropriated in the midst of much applause the then munificent sum of $165,000 for the public schools of the State for the year 1889. Sixteen years later the Legislature appropriates $1,000,000 for the same object.

Ships and Air Ships

It was in a discussion at the Royal Geographical Society in London the other day, after Mr. Mackinder had read a paper arguing that the high steppes of Asia have been the geographical pivot of history, that Mr. Amery remarked that pivots and localities were likely to make very little difference in the future. In the old days, when ships were slow and small, and roads were few, the broad steppe made a road anywhere, as does the sea, and the people living there were mobile on horseback for raids of war. But now the sea is far better for carrying troops than anything else, except fifteen or twenty lines of railways. But before long we shall have what is better than either land or sea, locomotion through the air; and then a great deal of this geographical distribution must lose its importance, and the successful Powers will be those which have the greatest industrial basis. It will make no difference whether they are on an island or in the center of Asia. They will surpass others only as they have industrial power and the power of invention. But somehow that air ship locomotion, which discards balloons, and is to do away with tariffs and boundaries, is slow in coming; but we do not lose faith in it. May it not be that the St. Louis Fair will be memorable for giving us the first real air ship.

Methodist Union in England

In England there are five Methodist denominations considering the question of Church union. These are the Wesleyans, the New Connexion, the Methodist Free Churches, the Bible Christians and the Primitive Methodists. Three of these smaller bodies are now actively engaged in negotiations. The large Mother Church, the Wesleyans, finds what is going on, and has, at its late Conference, made overtures. The Primitive Methodists are considering what position they can take in the union, and it is quite within the bounds of hope that in a few years successful negotiations may bring the five all together. The main trouble that the negotiations are likely to meet is in what is called connectionalism, under the machinery of the Pastoral Conference, which, with the Wesleyans, who have no bishops, takes the place of the episcopal power in this country to assign pastors, and has only ministerial members. The minor denominations, some of them demand liberty and fear clerical denomination. It would be a pity to have union break down on such a ground. One would think that there ought to be some way in which union might be arranged that would allow either assignment or liberty, as the churches might desire. We observe in this country that while the denominations that do not have

this connectional rule are unwilling to be put under the authority of bishops or pastoral committees, they are yet leaning toward some plan which will make it easier to find pastors. Uniformity is not desirable; it means despotism and stagnation. Union is not good if it means uniformity; it should mean larger freedom for all.

From Murder to Procrastination

We observe that a strong plea is made in the leading press of one of our most radical Southern States for a revision of our criminal law, which fails to punish "crimes of craft" against property. This is just; and yet, when we think of certain crimes against life prevalent in that section we are reminded of De Quincy's essay on "Murder as One of the Fine Arts":

> "If once a man indulges himself in murder, very soon he comes to think little of robbing, and from robbing he comes next to drinking and Sabbath-breaking, and from that to incivility and procrastination. Once begin upon this downward path, you never know where you are to stop. Many a man dated his ruin from some murder or other that perhaps he thought little of at the time."

The "best citizens," engaged only in a mere lynching. They may come to crimes of craft, which would be hardly respectable. This is the danger in Statesboro, Ga., where the wolves failed to protect the sheep, and where the Governor is investigating the conduct of the sheriff and militia, who allowed the mob to lynch two men. We admit that these two men, convicted of murder, were bad specimens of sheep, black sheep, indeed, but yet sheep to be protected under the laws. The evidence shows that only three of the soldiers tried or cared to do anything to protect the prisoners; and the sheriff was, if possible, worse. Not simply the "best citizens" of Statesboro, but the appointed sheriff and the designated soldiers virtually took part with the mob. The sheriff told the soldiers they might as well yield to the mob, as they could not do anything, and might hurt somebody. That is a variety of sheriff and militia which we hope is a curiosity in this country. We are not surprised to see it stated that the militia threaten to make it hot with those from other States if in a contemplated inter-state encampment they should be jeered at as cowards. We do not think that would be fair. They were not cowards, merely abettors of murder, nothing more. Yet that was hardly proper, and we fear they may, if they make it a habit, sink to Sabbath-breaking, incivility and procrastination.

War and Religion

Our Civil War gave us several new religious sects which still continue, for Presbyterians, Methodists and Baptists are still divided, North and South. It is not then strange that the South African War should have created at least one sect, altho it has been slow in coming. It is well known that President Kruger had no more doubt that justice and God were on his side than had our preachers and soldiers in our conflict. Christian faith was identified with the victory of the Boers, at least with Kruger, altho not with Piet de Wet. After the war the question arose as to what should be done with the "Surrenders"—*i. e.*, those who had been forced to lay down their arms before formal peace—and the "Scouts," who had voluntarily taken the stand with England. The first Dutch General Synod was held in May of last year, in which those who had aided the British were declared to have been "unfaithful," and to have committed "grievous sin against God and man," but a Pastoral Letter was issued, in which the demand was practically made that these "unfaithful" should repent. No general method of conduct was marked out, each congregation being permitted to deal with its own phase of the problem. The fact of the matter was that the "Surrenders" and "Scouts" were actually boycotted by the faithful. As a result the former were not satisfied, refused to "repent," and demanded a retraction of the Pastoral Letter from the officials of the Synod. In October the "unfaithful" held a convention for the purpose of organizing their own Church, independent of the national; but this step was prevented at the time through the influence of the Moderator of the National Church. Some months later, however, by a vote of 28 to 25 this step was taken; and we now have the Independent

Dutch Church in the Transvaal on friendly footing with England. The Church is not large numerically, and it is claimed that not a few of the separatists are already returning to the mother Church, where they are more cordially welcomed than before. Public sentiment of the defeated party is apt to be intolerant.

We thought Dr. William Farr had been suppressed, but we hear that he has started up his assorted honorary degree factory again in Washington, and has given it various names, as the George Washington University, or the University of Washington, and has been offering and distributing LL.D.'s and all the other sorts at what prices he could get, and now we are glad to know that the Post Office Department is trying to shut him from the use of the mails. We heard of him last as in the Nashville College of Law, and before that in Chicago, we believe, and we hear that he has had a similar career in Oklahoma, Omaha and Chattanooga. Any institution that is seeking candidates to give degrees on easy conditions, Ph.D., D.D. or LL.D., is a patent fraud that will deceive only those who are easy and conceited fools.
